PREFACE

THE 1908 edition of the ENCYCLOPEDIA OF SOCIAL REFORM is not the old edition revised, but a completely new book, save for a few historical or economic articles, the subjects of which need no new treatment—although many even of these are either revised or completely rewritten. All else is absolutely new, and it is believed that the work is very much more comprehensive and complete.

The two main requisites of an Encyclopedia are reliability and serviceableness. The first of these has been sought in this Encyclopedia by having nearly every article written by a specialist on his particular subject. Statements of reform have been generally written by a believer in the reform; together with this, or by reference to a corresponding article on the opposing side, a statement of the opposing view will be found. Historical, bibliographical, biographical, and statistical articles have generally been prepared and carefully revised by adequate authorities, mainly university professors and economic specialists.

Biographical articles, in the case of all living persons, have been, wherever possible, submitted to those persons. Articles on foreign countries have been, as a rule, either written by or submitted for revision to residents in those countries.

Serviceableness has been sought by making the work, while, as shown above, accurate and scholarly, yet popular and not technical. The Encyclopedia is for general workers and students. It has been prepared by specialists for those who are not specialists. Its references to books are therefore in the main only to books available to English readers. Articles have been arranged as to length and quality with this idea of serviceableness in view. Articles upon the best-known people are therefore often the shortest, and sometimes such are even omitted. This is not because they did not contribute to social reform, and often to a much larger degree than many who are considered, but because the general reader does not need the story of their life. The space allotted to articles, therefore, has considered the needs of the reader more than the absolute importance of the subject.

To the more important articles are appended brief bibliographies of the best available books upon the subject. There has been no attempt to make these exhaustive, but they will serve to guide the student in his search for more complete information.

Much matter of special British interest will be found in the fore part of the work. A few photographs of social reformers of various countries have been included from among the hundreds of names which figure in the work.

The subject of social reform is so vast, and may be made so inclusive, that almost any subject might have been included here; but the Encyclopedia aims to distinguish sharply between subjects that belong mainly to the individual and those that belong mainly to society. A few subjects, such as religion, science, etc., that concern both the individual and society, are treated only in their social aspects. The aim, however, has been to give on all the broad range of social reform the experience of the past, the facts of the present, the proposals for the future. The biographical portions will be found to be especially full. Of living persons the Encyclopedia generally treats only those having national or international recognition, and has thus been compelled to pass by many earnest and useful and successful local workers. In statistics we have gone to the best sources, but it must be remembered that statistics and statements in social reform are somewhat like the endeavour to count blossoms in springtime. Even while the count is going on, new blossoms are continually appearing, while not seldom a sudden chill wind carries some blossoms, which have been counted, to the ground before the tally is complete. It is springtime in social reform, and spring can never be put into any book.

Wherever possible we have made use of governmental and official figures, even while figures could be found slightly more recent, but less reliable. In cases like those of statistical returns, not usually

reported by governments, we are indebted to year books, such as "The Municipal Year Book," "The Reformer's Year Book," "The Daily Mail Year Book," Coglan's "Statistical Account of Australia and New Zealand," "The London Manual," to German, French, and other year books. To the large number of economic and sociological magazines, books, and sources quoted in this work we give credit in the text, and would specially mention *The Review of Reviews* and *The Daily Chronicle* for valuable co-operation in the preparation of the British edition.

We desire to express our great indebtedness to the very large number of writers, scholars, and authorities who have contributed valuable articles, or have done the sometimes equally valuable work of revision. For the large majority of these it has been a gratuitous labour of love which alone has made this work financially possible. The names of our main contributors and revisers we give herewith, but the list is not a complete one. To a much longer list of society secretaries and others we are indebted for valuable assistance and material.

THE ENCYCLOPEDIA OF SOCIAL REFORM

A

ADULTERATION: Legislation has been active of late years on the question of pure food. The chief English newspapers had a campaign against "The Fraud of the Label," which roused public opinion much as, later, the tinned meat disclosures of Chicago did. The Trade Marks Act of 1905 had a distinct bearing on the question insomuch as it protected well-known trade-marks of leading food firms from infringement by substitutors of inferior qualities. On the much vexed question of Butter Adulteration, a Select Committee of the House of Commons held seventeen sittings, and issued a report in July, 1906, from which resulted the Butter and Margarine Act of 1907, by which (1) adulterant material of any kind was prohibited in butter factories; (2) a sixteen per cent. maximum limit of moisture was fixed, with a maximum of twenty-four per cent. of water for the so-called "milk-blended" butters; (3) milk-blended butter (see earlier history, p. 10) prohibited to be sold under that name or any name conveying the meaning of "butter," and for the purposes of any offences to be treated similarly to the provisions which govern the sale of margarine; (4) margarine not to contain more than sixteen per cent. moisture or more than ten per cent. of butter fat, and to be labelled distinctly "margarine," with the addition of any fancy name by which the mixture may be called; (5) a strict limitation was defined on the use of preservatives. This Act came into force in January, 1908.

Preservatives

The report issued in the summer of 1908 by Dr. A. W. J. MacFadden to the Local Government Board on "Preservatives in Canned and Glass-packed Meats of Home and Foreign Origins, with Observations on the Manufacture of such Meats," showed that out of a total of 1733 hermetically-sealed tins or glasses dealt with no fewer than 333, or over nineteen per cent., were reported to contain chemical preservatives other than salt and saltpetre. Of these preservatives, 243 were boron compounds, forming fourteen per cent. of the whole, and in the remaining ninety samples the presence of sulphate preservatives was reported. In meat foods of this kind there should be no need for the addition of chemical antiseptics at the time of preparation of the meat for canning, and the meat should ordinarily be fresh, or cured—not meat which has been subjected to treatment involving the introduction of preservatives such as boric acid or sulphites. The Local Government Board representative made exhaustive inquiries and visits to the principal factories and storage houses in England, the conclusions drawn therefrom being on the whole satisfactory, but he urged stricter supervision of factories. The report advocated a limit of one quarter per cent. of boric acid. It condemned the practice of using solutions of sulphurous acid or sulphites. The action recommended to protect the public was the issue of suitable regulations under the Public Health (Regulations as to Food) Act, 1907. Legislation as to supervision of the preparation of meat foods has recently been enacted in various States of Australia, in New Zealand, in Canada, and the United States.

ADULT SCHOOL UNION, NATIONAL COUNCIL OF THE: Founded in 1845 in Birmingham by Mr. Joseph Sturge. Object: For Bible study and mutual helpfulness among men. Chairman, Mr. W. C. Braithwaite. *Organizing Secretary:* Mr. Edwin Gilbert, Bournville.

AERIAL NAVIGATION: General Baden-Powell is of opinion that "more sound progress in the navigation of the air has been made in the last twelve months (1907–8) than for a long period before." In Europe and the United States experiments are continually in active progress for the perfecting of airships, dirigible balloons, and other flying devices for war and ordinary purposes, and a considerable measure of success has been attained. In Germany the Zeppelin airship made a flight of almost twenty-four hours' duration, during which it covered 444 miles before its destruction by explosion during a heavy storm on August 5th, 1908. In construction this was the most ambitious of any produced, insomuch as it was built to convey several passengers. The German airship is not the only one to meet with an untimely end. The French dirigible balloon La Patrie, which had made a speed of twenty-five miles an hour, became a victim to the weather after breaking away from her moorings, and the British Nulli Secundus, which created a sensation by sailing round St. Paul's Cathedral on October 3rd, 1907, was so damaged at her moorings by strong winds that she had to be taken to pieces. The American Morrel airship burst. Government war balloons have also been unfortunate; a Russian balloon was lost with three officers, an Italian balloon was struck with lightning and the operator killed, and a British one was carried out to sea and the dead bodies of the two officers recovered later. On September 16th, 1908, while proceeding to Bornstedt, for inspection by the German Emperor, Major von Parsival's dirigible balloon was practically wrecked. M. Delagrange, a French aeronaut, who had achieved some very successful flights at Isay-les-Moulineux, also eventually went to swell the list; but perhaps one of the most serious accidents was that which occurred to Mr. Orville Wright on September 17th, 1908, at Washington. Mr. Wright, who a week previously had created a world's record at Fort Myer by remaining in the air 62 min. 13 secs., was in mid-air when a propeller snapped, and the aeroplane came down with a crash to earth. Mr. Wright was injured, and a United States' officer, who was on the aeroplane, killed.

The Farman aeroplane has made a series of successful ascents, and its inventor, Mr. Henry Farman, an Englishman, has won a £2000 prize for continuous flight. At Le Mans (France) on September 21st, 1908, Mr. Wilbur Wright exceeded his brother's record by flying for an hour and a half. Capt. Thos. S. Baldwin has so far succeeded in trials of his dirigible balloon, that the United States War Department purchased it in 1908.

MM. Santos-Dumont, Blériot, Roe, and others, have devices in various stages of evolution.

Serious Obstacles

Professor Simon Newcomb, writing in the *Nineteenth Century* for August, 1908, details some serious obstacles in the way of anticipated progress. As regards the "flyer" (aeroplane) every form has drawbacks which, according to the professor, appear fatal to its extensive use, and there are difficulties in the way of the airship which are also formidable. The main drawbacks to the former are given as—

1. It must present to the air a horizontal surface proportional to the entire weight to be carried, including motor machine and cargo. The present extent of the successful flyers suggests a practically unmanageable area of supporting surface and consequent weakening of the machine.

2. The flyer can never stop to have its machinery repaired or adjusted. Steamships would be little use if they went to the bottom every time an accident happened to the machinery.

3. The flyer cannot be navigated out of sight of ground or in a fog.

Its inutility in war is most particularly emphasized; the flyer, he says briefly, is out of the question. The airship proper, or enlarged balloon, is the only agency to be feared. Her vulnerability is obvious. Her size is so great as to make her an easy target; her sides so thin that she can be pierced through and through by any bullet, even that of a revolver; and her interior composed of gas so inflammable that an explosive bullet would reduce her to a mass of flame. A single yeoman, armed with a repeating rifle, could disable a whole fleet of airships approaching the ground within range of his station before the crews could even see where he was or what he was doing. How many such vehicles would be required to carry and land, with all its accoutrements, an armed force sufficiently large to be a menace need hardly be computed. To carry out the enterprise the fleet must either operate at night or choose an hour when the country is enveloped in fog. Saying nothing of the difficulties inherent in navigating the air and of choosing a point of landing when the ground is invisible, it would be easy by a system of searchlights to make a landing as difficult at night as during the day. Should advantage be taken of a smoky and foggy day, with a view of landing without being seen, the difficulties would be as great on the side of the aerial vehicle as on that of the defence against it. The navigator of an airship must at all times be at the disadvantages already mentioned, one of which is that of being always carried with the wind, and of knowing nothing of his motion at the moment except what he can learn by observing the ground. He would therefore be unable to find his way in a fog. Above the region of fog and cloud he might in an uncertain way be guided by observations of the sun or stars, but this would be much more uncertain than in the navigation of a ship, owing to the want of a clear horizon. The more closely one analyzes the conditions and the requirements of an invading force, the more clearly it will be seen that the idea of invading England with a formidable army borne in airships is quite chimerical. If a single airship or, to guard against accident, two or three, can, by watching a favourable opportunity, destroy an aerial navy in its own country in any stage of its construction, may we not assume that no Power is going on to make any great effort to develop such a navy after the possibilities are fully appreciated?

From an economic point of view, Professor Newcomb does not consider the airship's value great in the matter of competition with train or steamship. Compared with the former, the airship would have to be much larger in size and would accordingly encounter greater air resistance, thus entailing more propelling power, while as regards the latter, similar and equally insurmountable difficulties are in the way of the airship's successful competition as a carrier of passengers or merchandise.

Mr. Edison's Views

Mr. Edison also considers that construction in the matter of aerial navigation is proceeding on the wrong lines. His views are expressed in the *Times* of September 17th, 1908. The great inventor evidently pins his faith to the "helicoptal" aeroplane, whereby when perfected it will be possible to "encircle the globe in a week." The correspondent further quotes him as saying "within five years airships will be carrying passengers across the ocean in eighteen hours, by which time aerial flight will have been commercialized. The North Pole can and will be reached in a forty-hour trip."

Discussing the present type of aeroplane used by the Wrights and others, Mr. Edison is credited with the following comments:—

"The weak point in the present aeroplane, which the Wrights will never overcome, is that the working of the machine lies wholly in the wonderful brain of its operator. Every movement made by the Wrights in manœuvring the machine must be done in perfect harmony with the working of the planes. One fractional mismovement would mean destruction to the machine and also its operator.

"With the circular application of the principle of the aeroplane, making what I have styled a 'helicoptal' aeroplane, the commercializing of aerial flight is a mere matter of perfecting the idea. The successful machine must be automatic in its operation. The human part of it must be reduced to a mere mechanism, as in the case of the automobile and the steam engine. Otherwise the dream of skimming the clouds must ever remain a dream. For twenty years, off and on, I have turned my attention to this absorbing problem of the twentieth century. Long ago I saw the impracticability of the lighter-than-air machine such as the dirigible balloon. Too much depends on climatological conditions in experimenting with the gas-bag theory. The aeroplane appealed to me most strongly, but it is plain to me now that a successful airship will never be constructed on that theory. The aeroplane is the primitive adoption of the 'bird-wing' theory, and as we do not possess the ability to secure the automatic action of the bird, it is impossible in practice.

"In commercializing any new invention we must not follow nature. For instance, in the effort to discover some means of propelling physical bodies without employing elemental force such as muscle we did not turn to the human legs theory. Far from it; we invented first the bicycle and then the automobile, both great improvements over nature's methods.

"The same idea must be followed in solving the present problem. With a series of aeroplanes forming a circular machine, with each plane running off on a tangent from the central motor, and two small—very small—propelling planes (the smaller the greater velocity), and the gyroscope principle introduced as a steadying factor, the problem is solved."

Finally, Mr. Edison predicts that within a few months all great inventors will turn in despair to this theory, with which, he says, several obscure inventors are already beginning to experiment. There is even a promise, it is to be gathered, that Mr. Edison may, after all, enter the field for himself.

AGRICULTURAL ORGANIZATION SOCIETY, Ltd.: The objects and earlier progress of this society are detailed on page 13. The number of affiliated societies in August, 1908, was 257, as follows: For the supply of requirements or sale of produce, 121; dairy, thirteen; credit, twenty; small holdings and allotments, eighty-five; miscellaneous, sixteen; federations, two.

The total membership of the affiliated societies is now probably about thirteen thousand, and the total turnover in 1908 about £800,000. The increase in the number of small holdings and allotments societies since the beginning of 1908 (when they numbered thirteen) will be noticed. President, Mr. R. A. Yerburgh. *Secretary:* Mr. J. Nugent Harris, Dacre House, Westminster, London, S.W.

ALLIANCE OF HONOUR, THE: An interdenominational movement which is rapidly growing in various countries. Object: (1) To impress upon men and youths the necessity of leading pure lives, and (2) to unite them in a world-wide effort on behalf of purity and a chivalrous respect for womanhood. President, Dr. Harry Grattan Guinness. *Hon. Secretaries:* Messrs. Evelyn E. Bagnall and Alfred B. Kent, 5, Beresford Road, Canonbury, London, N.

ALLOTMENTS: (See under SMALL HOLDINGS.)

ALLOTMENTS SOCIETY, THE NORTHERN: Founded in 1890. Object: The dissemination of knowledge relating to *petite* culture in all its branches, and the promotion of combined action in the acquisition of land or otherwise in furtherance of the same. *Hon. Secretary:* Mr. Joseph W. Wakinshaw, 48, Dean Street, Newcastle-on-Tyne.

AMALGAMATION OF RAILWAYS: (See under RAILWAY PROBLEMS.)

ANGLO-GERMAN FRIENDSHIP COMMITTEE: Founded in 1905. Object: To promote friendly relations between Germany and Great Britain. Hon. President, The Duke of Argyll. *Hon. Secretary:* Mr. Francis Wm. Fox, Caxton House, Westminster, London, S.W.

ANTI-BEARING REIN ASSOCIATION: Founded in 1890. Object: To bring the uselessness and cruelty of the bearing and hame reins before the public. Official organ, *Animals' Friend*, monthly, 2*d*. *Hon. Secretary:* Mr. Ernest Bell, York House, Portugal Street, London, W.C.

ANTI-GAMBLING LEAGUE, THE NATIONAL: Founded in 1890. Object: To promote reform by education, legislation, and the effective administration of existing laws and bye-laws. Official organ, *The Bulletin*, semi-annual, 1*d*. President, The Earl of Aberdeen. *Hon. Secretary:* Mr. John Hawke, 13, Victoria Street, London, S.W.

ANTI-SMOKING UNION, BRITISH LADS': Affiliated with the BRITISH UNION OF NON-SMOKERS (*q.v.*).

ANTI-SUFFRAGE: (See under WOMEN'S NATIONAL ANTI-SUFFRAGE LEAGUE.)

ANTI-VACCINATION LEAGUE, SCOTTISH: President, Mr. Andrew Eadie. *Secretary:* Mr. Wm. J. Begg, 150, Hope Street, Glasgow.

ANTI-VACCINATION LEAGUE, THE NATIONAL: Founded in 1897. There are about one hundred branches in various parts of the country; also Scottish and Irish leagues. The modification in the law of compulsory vaccination carried out by Parliament in 1898 and 1907 may largely be attributed to the work of the League. A memorial was presented in 1907 to the Prime Minister, signed by about three hundred Members of Parliament, asking for the total abolition of compulsory vaccination. Official organ, *The Vaccination Inquirer*, monthly, 1*d*. President, Lieut.-General Phelps. *Secretary:* Mr. Charles Gane, 50, Parliament Street, Westminster, London, S.W.

ANTI-VIVISECTION: (See under VIVISECTION.)

ANTI-VIVISECTION SOCIETY, LONDON AND PROVINCIAL: Founded in 1876. The society supports the only van run on behalf of this cause throughout the world. Official organ, *Animals' Guardian*, monthly, 2*d*. President, Earl Tankerville. *Secretary:* Mr. Sidney Trist, 13, Regent Street, London, S.W. (See also VIVISECTION.)

ANTI-VIVISECTION SOCIETY, THE NATIONAL: Founded in 1875. Object: The total abolition of scientific torture of animals. The Society has fifty-three branches and divisions throughout the United Kingdom and Ireland. Official organ, *The Zoophilist and Animals' Defender*, monthly, 3*d*. Director, The Hon. Stephen Coleridge. *Secretary:* Mr. Robert Stewart, 92, Victoria Street, London, S.W. (See also VIVISECTION.)

"APACHES" OF PARIS: On parallel lines to the Hooligans of London are the Apaches of Paris, who, whether male or female, have as little respect for constituted authority or private rights as the American Indians from whom their name is derived. The ruffianism of organized bands of these Apaches is a serious menace to the whole community, and one of the most difficult of Parisian social problems is the reformation or removal of these hordes of lawless marauders. An idea of their number may be gathered from the fact that in but one raid in August, 1908, three hundred arrests were made. It is estimated that in Paris there are ten Apaches to one gendarme. A typical incident occurred on Sunday, August 30th, 1908, which was thus reported: "For some months past the region just outside the eastern fortifications of Paris has been terrorized by a gang of Apaches called the *Bande de Montreuil*. These brigands, numbering about sixty, were perfectly organized, having an efficient intelligence department, and a system of scouting to avoid the police. The latter are not unduly numerous in the district, being in the proportion of one gendarme to two thousand inhabitants.

"Burglaries, highway robberies, and murders were the specialities of these freebooters, and the number of attacks became so alarming during the past month that the local authorities mobilized their forces, and with the co-operation of some extra men from the Prefecture of Police, organized a raid. They were fortunate enough to catch a portion of the band 'in the act,' and after a short, sharp fight, in which firearms were freely used, captured about a dozen of them.

"All the Apaches were under twenty-one years of age, several being only just sixteen. At the trials they displayed the most astonishing cynicism, proudly admitting the authorship of several murders which had hitherto been undetected."

The Apaches greatly affect the *Casquette à trois ponts*, or peaked form of headgear, and a red tie, although the former is not invariably indicative that the wearer is a member of these gangs.

ARBITRATION AND CONCILIATION BOARDS, INDUSTRIAL: There are numerous Arbitration and Conciliation Boards among various trades in the United Kingdom. The Trade Union Congress of September, 1906, rejected by 938,000 votes to 541,000 a resolution by Mr. Ben Tillett, asking for a Bill that should provide (1) a court with authority to determine a minimum wage; (2) form industrial boards of conciliation and arbitration in all large industrial centres; these courts to be constituted by an equal number of workmen and employers' representatives, the former to be selected

under the auspices of the Parliamentary Committee from affiliated membership of the Congress.

The Congress unanimously passed the resolution: That this Congress reaffirms the decision of previous congresses—that no Trade Disputes Bill will be satisfactory which does not secure what was understood as the ante-Taff Vale position on the basis of the complete immunity of the funds of trade unions from litigation, and that the Parliamentary Committee convene a meeting of the whole of the Labour members previous to the autumn session to consider the Bill as amended in committee.

An Act covering this last resolution was passed by Parliament in December, 1906, entitled the Trade Disputes Act, which gave general satisfaction to the Labour Party. At the beginning of 1908 there were 209 such boards known to the Board of Trade, and at that time at least sixty of these had bound themselves to accept the arbitration of the Board of Trade in case of disagreement.

Speaking at the opening of the new Cardiff Docks, on July 15th, 1907, on the matter of Industrial Arbitration, his Majesty King Edward VII. said: "I learn with pleasure of the successful working of your Conciliation Board, and the friendly relations which now exist between employers and employed in this district. The settlement of differences as to the remuneration of the worker and of other industrial disputes as they arise, by friendly discussion and co-operation, must tend to the mutual prosperity and to the general welfare of the district.

At the Trade Union Congress held in Nottingham in September, 1908, there was rejected by an overwhelming majority a proposal by Mr. Ben Tillett in favour of giving compulsory powers to the Board of Trade to inquire into disputes when requested by one of the disputing parties. The Congress also refused to endorse proposals in favour of arbitration and boards of conciliation in large industrial centres.

Arbitration Court

The most recent advance in the matter of Industrial Arbitration is the action of the President of the Board of Trade, Rt. Hon. Winston Churchill, who proposes to establish a Standing Court of Arbitration, and, with that end in view, issued a memorandum on September 16th, 1908, to Chambers of Commerce and employers' and workmen's associations. Mr. Winston Churchill's idea is to consolidate, expand, and popularize the working of the Conciliation Act, 1896, under which the Board has power to appoint a conciliator in trade disputes. The Court will be nominated by the Board of Trade from three panels. The first comprises persons of eminence and impartiality for the position of chairman; the second, persons from the "employer class"; and the third, representatives of workmen and trade unionists. Three or five members may constitute the Court, according to the wishes of the parties concerned. Technical assessors may also be appointed for the purpose simply of elucidating the peculiarities of any trade. By changing the *personnel* of the Court, and securing members unconnected with the case in dispute, it is hoped the decisions will be regarded as having come from an impartial and competent body.

The following are indicated (October 19th, 1908) as having accepted the President's invitation to serve on the respective panels:—

PANEL FOR CHAIRMAN.

Duke of Devonshire.	Sir J. Dickson-Poynder, M.P.
Viscount Selby.	Sir Francis Hopwood.
Viscount St. Aldwyn.	Sir Alfred Bateman.
Lord Balfour of Burleigh.	Mr. Ernest Moon, K.C.
Lord James of Hereford.	Mr. G. R. Askwith, K.C.
Lord Lochee.	Mr. A. A. Hudson.
Lord Macdonnell.	Mr. W. B. Yates.
Sir Edward Fry.	

PANEL DRAWN FROM EMPLOYERS.

Lord Pirrie.	Sir F. Forbes Adam, C.I.E.
Lord Glantawe.	Sir Benjamin Browne.
Sir Hugh Bell, Bart.	Sir C. Furness, M.P.
Sir W. T. Lewis, Bart.	Mr. T. Ratcliffe Ellis.
Sir C. McLaren, M.P.	Mr. C. G. Hyde, M.P.
Sir S. B. Boulton, Bart.	Mr. L. A. Martin.
Sir A. Spicer, Bart., M.P.	Mr. W. H. Mitchell.
Sir W. Holland, Bart., M.P.	Mr. Alexander Siemens.
	Mr. Douglas Upton.

PANEL DRAWN FROM WORKPEOPLE.

Mr. G. N. Barnes, M.P.	Mr. James Gavin.
Mr. R. Bell, M.P.	Mr. A. H. Gill, M.P.
Mr. C. W. Bowerman, M.P.	Mr. Arthur Henderson, M.P.
Mr. W. Brace, M.P.	Mr. G. D. Kelley, M.P.
Mr. John Burnett.	Mr. J. D. Prior.
Mr. T. Burt, M.P.	Mr. E. L. Richardson.
Mr. Frank Chandler.	Mr. D. J. Shackleton, M.P.
Mr. W. J. Davis.	Mr. T. Smith.

The proposals of the President of the Board of Trade are given below in full. It will be observed that the Court's powers can only be invoked by agreement between the disputing parties.

1. Under the Conciliation Act of 1896 the Board of Trade has power to appoint a conciliator in trade disputes and an arbitrator at the request of both parties. These slender means of intervention have been employed in cases where opportunity has offered, and the work of the Department in this sphere has considerably increased of recent years. In 1905 the Board of Trade intervened in fourteen disputes and settled them all; in 1906 they intervened in twenty cases and settled sixteen; in 1907 they intervened in thirty-nine cases and settled thirty-two; while during the first eight months of the present year no fewer than forty-seven cases of intervention have occurred, of which thirty-five have been already settled, while some of the remainder are still being dealt with.

2. It is not proposed to curtail or replace any of the existing functions or practices under the Conciliation Act, nor in any respect to depart from its voluntary and permissive character. The good offices of the department will still be available to all in industrial circles for the settlement of disputes whenever opportunity offers; single arbitrators and conciliators will still be appointed whenever desired; special interventions will still be undertaken in special cases, and no element of compulsion will enter into any of these proceedings. But the time has now arrived when the scale of these operations deserves, and indeed requires, the creation of some more formal and permanent machinery, and, with a view to consolidating, expanding, and popularizing the working of the Conciliation Act, I propose to set up a Standing Court of Arbitration.

3. The Court, which will sit whenever required, will be composed of three (or five) members, according to the wishes of the parties, with fees and expenses to members of the Court, and to the chairmen during sittings. The Court will be nominated by the Board of Trade from three panels. The first panel—of chairmen—will comprise persons of eminence and impartiality. The second will be formed of persons who, while preserving an impartial mind in regard to the particular dispute, are nevertheless drawn from the "employer class." The third panel will be formed of persons similarly drawn from the class of workmen and trade unionists. It is hoped that this composition will remove from the Court the reproach which workmen have sometimes brought against individual conciliators and arbitrators, that, however fair they mean to be, they do not intimately understand the position of the manual labourer.

It is believed that by the appointment of two arbitrators selected from the employers' panel and two from the workmen's panel in difficult cases, thus constituting a Court of five instead of three persons, the decisions of the Court would be rendered more authoritative, especially to the workmen, who, according to the information of the Board of Trade, are more ready to submit to the judgment of two of their representatives than of one. As the *personnel* of the Court would be constantly varied, there would be no danger of the Court itself becoming unpopular with either class in consequence of any particular decision; there would be no difficulty in choosing members quite unconnected with the case in dispute, and no inconvenient labour would be imposed upon any one who consented to serve on the panels. Lastly, in order that the peculiar conditions of any trade may be fully explained to the Court, technical assessors may be appointed by the Board of Trade at the request of the Court or of the parties to assist in the deliberations, but without any right to vote.

The Personnel

4. The state of public opinion upon the general question of arbitration in trade disputes may be very conveniently tested by such a voluntary arrangement. Careful inquiry through various channels open to the Board of Trade justifies the expectation that the plan would not be unwelcome in industrial circles. The Court will only be called into being if, and in proportion as, it is actually wanted. No fresh legislation is necessary.

5. Steps will now be taken to form the respective panels.

Discussing this memorandum the *Daily Chronicle*, in a leading article, said :—

"This new departure will, we are convinced, bring a powerful reinforcement to the influences making for and insuring industrial peace. Though good use has been made of them, only slender powers are possessed by the Board of Trade for intervening in disputes between capital and labour. The time is ripe for a further extension of the arbitration idea. A permanent Court of Arbitration will not supersede, but supplement the existing arrangements under which the services of the President of the Board of Trade may be invoked. But in Mr. Churchill's opinion the time has arrived for the creation of some more formal and permanent machinery, and it is in this conviction that he has determined to set up a Standing Court of Arbitration. Individualistic ideas are too deeply rooted in this country for compulsory arbitration to be possible. Mr. Churchill has taken great care in the constitution of the Court to insure that it will command public confidence. Either one or two arbitrators are to be chosen equally from the employers' and the workmen's panels—these, with the chairman, constituting the Court. It seems to us that the decisions of a Court so constituted would be accepted by both parties in the vast majority of industrial disputes. As for the nation generally, it will welcome with genuine satisfaction such well-directed efforts to promote peace and concord in the world of labour."

Mr. Richard Bell, M.P., general secretary of the Amalgamated Society of Railway Servants, gave the following expression of opinion as to Mr. Winston Churchill's proposals :—

"The new permanent board, constituted as the President of the Board of Trade suggests, may help in bringing matters to arbitration sooner than would be the case under the present system. There may be in the panel of 'eminent persons' one name or more that will command the confidence of both parties to a dispute.

"At present one of the chief objections to the proposal to arbitrate is very likely to be that the contesting parties do not know who the arbitrator is likely to be. It is quite possible that the removal of that element of uncertainty would facilitate the bringing of the two sides together. They would see the list of names in the various panels, and although the Board of Trade will nominate the members from the various panels to form the Board, or Court, each side would probably be able, with acceptance, to indicate any strong predilection they might feel for certain individuals from the panel of their own class, and for the chairman.

"Personally, it strikes me the new scheme will be a distinct advance on the existing methods."

The mixed panel system proposed in connection with the new arbitration court has worked very successfully in the case of the Conciliation and Arbitration Board of the London Chamber of Commerce, which consists of a panel of twelve representatives of employers, and twelve representatives of trade unions. Since its formation, as a result of the great dock strike, it has done good service in settling labour troubles of various kinds all over London. Mr. S. B. Boulton, who has presided at most of its deliberations, testifies to the spirit of impartiality with which these mixed panels deal with the questions submitted to their arbitration. Mr. Ramsay Macdonald, M.P., while regarding the scheme hopefully, thought it would fail to meet the difficulty in the larger cases typified by the Penrhyn and North-East Coast disputes. Mr. J. O'Grady, M.P., expressed the opinion that if the scheme failed, compulsory arbitration would follow.

The President of the Board of Trade (the Rt. Hon. Winston Churchill) was mainly instrumental in arranging the terms submitted by the men's representatives and accepted by the masters at a conference, which ended the great engineering dispute on the north-east coast, held in London on September 2nd, 1908. The enormous loss resulting from this dispute, in the matter of wages and strike pay, forms a powerful argument, from an economic point of view, on behalf of some adequate measure of providing a means of arbitration and conciliation approved alike by employers and employed. The figures show that fourteen thousand men were affected, whose wages averaged 35*s.* a week. The twenty-eight weeks, during which the strike lasted, thus represent a loss in wages of £686,000, and on strike pay (taken from the funds) £392,000, a total cost of £1,078,000. The men were fighting against a reduction of £1225 a week in their wages, and the result is that they have prevented half of that reduction, or £612 10*s.* a week. Reckoning this £612 10*s.* as gain to the men, a brief calculation shows that it will take them over thirty-three years to make up the amount they have lost in obtaining it.

Disputes in 1908

A dispute arising between the Great Eastern Railway Company and their staff in August, 1908, further emphasized the need of some machinery of conciliation to avert the dangers of such industrial strife. While the affair was in its early stages, Mr. Richard Bell advised the men to keep in line with the agreement under which the Conciliation Boards were established, and let the company have their reply within the two months. It would then be for the company to make the next move. If they were not satisfied with the men's refusal to accept the threatened reductions, they should then refer the dispute to the Conciliation Board.

No stronger evidence of the disastrous effects, not only upon local industry, but upon the national prosperity, of industrial deadlocks on questions of work or wages arising between masters and men, is needed than was shown in connection with a great crisis in the Lancashire cotton industry, which reached an acute stage in September, 1908. Resistance to a proposed reduction of five per cent. in wages, formally intimated to the workmen on August 4th, resulted in a series of strikes and lock-outs in the various sections of the industry, the number of men directly involved being 150,000, and the number of spindles affected nearly forty-five millions. It was estimated that the loss in wages aggregated no less than £150,000 weekly. The nation's direct interest in the

matter may be gathered from the fact that the Lancashire export of cotton is worth over £2,000,000 a week.

A return published on October 17th, 1908, gave the estimated loss to date as £3,500,000, *i.e.* operatives loss in wages £2,000,000; lock-out pay £220,000, coal consumption lost £1,200,000, railway traffic lost £80,000. From the original number, the spinners and weavers on strike or locked out had increased to over 400,000 by the middle of October.

The results of the Railway Crisis at the end of 1907, and the Conciliation Board then established, are dealt with under RAILWAY PROBLEMS.

ARBITRATION, JOINT BOARD OF: (Affiliated with the CO-OPERATIVE UNION, Ltd.). Object: To make inquiry into disputes which may be submitted to it, arising between Co-operative Societies and their employees, with the purpose of bringing about a mutual and amicable settlement. President, Mr. J. T. Howden. *Secretary:* Mr. James Deans, 263, Wallace Street, Kingston, Glasgow.

ARBITRATION SOCIETY: (See under PEACE AND ARBITRATION SOCIETY.)

ARMENIA, THE FRIENDS OF: Founded in 1897. Object: To agitate for reform in Turkish administration, and to support relief works for Armenians at home and abroad. Official organ, *The Friend of Armenia.* President, Lady Frederick Cavendish. *Hon. Secretaries:* Mrs. Mary Hickson and Miss G. Cantlow, 47, Victoria Street, Westminster, London, S.W.

ART FOR SCHOOLS ASSOCIATION: Founded in 1883. (Incorporated.) Object: To supply an educational basis for the work already being done by loan exhibitions of pictures in poor districts of London and other large towns. President, The Earl of Carlisle. *Secretary:* Miss M. L. Cooper, Passmore Edwards Settlement, Tavistock Place, London, W.C.

ASIATICS IN THE TRANSVAAL: (See under SOUTH AFRICA.)

B

BALKAN COMMITTEE, THE: Founded in 1903. Object: To promote reform in European Turkey, to rouse interest in the Balkan States, and to organize relief for the victims of disorder. Membership, eighteen hundred. President, Professor Westlake. *Secretary:* Mr. W. A. Moore, F.R.G.S., 10, Adelphi Terrace, W.C.

BAND OF HOPE, GREENWICH ROYAL HOSPITAL SCHOOL: Founded in 1871 to instruct the boys in training for the Royal Navy, in the principles of total abstinence, and to encourage them in all habits of self-control, good temper, and manliness. Four hundred lads have signed total abstinence pledges during 1907–1908; and fully ten thousand since 1892. President, The Captain Superintendent of R. H. School. *Secretary and Chairman:* Mr. W. S. Campbell, Greenwich Royal Hospital School, London, S.E.

BAND OF HOPE UNION, UNITED KINGDOM: Founded in 1855 (non-political and unsectarian). In August, 1908, there were 14,393 Bands of Hope with 2,086,985 members grouped, chiefly, into 363 Local or other Unions; sixteen trained lecturers have addressed 4145 schools attended by 384,225 scholars and 11,620 teachers; 229,959 reports of these addresses were written by the scholars. A department was sustained of scientific information and instruction, and a special mission made on behalf of young villagers. The total cost of the general work for the year ending 31st March, 1908, was £3713 18*s.* 3*d.* Official organs, *The Band of Hope Chronicle*, monthly, 1*d.*, and *The Band of Hope Review*, ½*d.* Chairman, Mr. Lionel Mundy. *Secretary:* Mr. Charles Wakely, 59, Old Bailey, London, E.C.

BARMAIDS, JOINT COMMITTEE ON THE EMPLOYMENT OF: Object: To influence public opinion and legislation in the direction of preventing the employment of women and girls as barmaids who are not already in the trade. A Bill was introduced in the House of Commons by Mr. G. P. Gooch, M.P., in 1907, on these lines, and also giving powers to licensing magistrates to make the non-employment of barmaids a condition of renewing licences. Early in 1908 an influentially signed memorandum was sent to the Prime Minister and the press. President, Mrs. J. R. MacDonald. *Secretary:* Mrs. Gooch, South Villa, Campden Hill Road, London, W.

BATHS, PUBLIC: In Great Britain the provision of public baths is generally left in the hands of the municipal authorities. The first Baths and Washhouses Act was passed in 1846, and other Acts or sections of Acts dealing therewith are dated 1878, 1882, 1894, 1899. To Liverpool and London belong the distinction of establishing the first public baths in England. The majority of the baths are conducted at a loss, and so become a charge on the rates. In 1908 statistics were published showing that down to 1902, 138 baths were maintained by borough councils, with an aggregate capital of £1,988,340, and from 1898 to 1902, a period of four years only, there was a loss of £124,952, after allowing for loan charges. Outside of London, Glasgow has the most capital expended in public baths, £273,628. The total expenditure in the United Kingdom under the Baths and Washhouses Act for the 1906–7 period was £492,289, and the receipts £345,937, The history and statistics of public baths abroad will be found on page 100.

BIRTH RATES: One of the most striking features of the world aspect of this question is that, for the first time in history, the birth rate of the world was in 1907 lower than the death rate. This, according to M. de Foville, president of the *Académie des Sciences et Politiques*, writing in Paris *Opinion*, August 21st, 1908, is due to the unprecedented drop in the French birth rate. In 1906 there were in France 27,000 more births than deaths, but for 1907 the deaths exceeded the births by 20,000, *i.e.* 774,000 births as against 794,000 deaths. This alarming circumstance is attributed to the laxity of the law in regard to criminal practices, the increasing ease with which divorce can be obtained, and the prevalence of pernicious teachings. In one hundred years the French birth rate has diminished from 32 per 1000 to 19·7 per 1000. In the United Kingdom also the birth rate is declining. In 1904 it was the lowest (2790 per 100,000) since birth registration began. In 1906—the latest statistics available—the birth rate per thousand was 26·8 for the United Kingdom, for London 26·5, for Edinburgh 22·4, and for Dublin 29·5. The birth rate is still, however, substantially in advance of the death rate for the United Kingdom, which was 15·6 for 1906.

BORSTAL SYSTEM: (See under PENOLOGY.)

BRABAZON EMPLOYMENT SOCIETY: Founded in 1884. Object: To provide interesting occupation for those who, from age or ill health, have to pass the hours idly in infirmary or workhouse wards. The Society consists of about three hundred branches in the United Kingdom, and there are also branches in Tasmania, South Africa, and America. Ladies voluntarily give up their time to teaching and helping the inmates with their work. President, The Countess of Meath. *Secretary:* Miss M. L. Despard, 51, Upper Baker Street, London, N.W.

BRADFORD CITY GUILD OF HELP: (See GUILD OF HELP, BRADFORD CITY.)

BRITISH INSTITUTE OF SOCIAL SERVICE: Founded in 1905. Objects: To collect, register, and disseminate information relating to all forms of Social Service; to give assistance to all organizations that have social aims and to facilitate co-operation between them; and, as far as possible, to prevent overlapping. The Institute supports a free inquiry bureau, reference library, and register of voluntary workers. Official organ, *Progress*, quarterly, 6*d*. President, The Earl of Meath, K.P. *Secretary:* Mr. F. James Matheson, 11, Southampton Row, London, W.C.

BRITISH NAVY: (See under NAVY.)

BROTHERHOOD ASSOCIATION, THE: Founded in 1897. Object: To further the organization of industry on a basis of production for use. Official organ, *The Associate*, quarterly, gratis. *Hon. Secretary:* Miss Frances L. Staff, 37, Newington Green Road, London, N.

BUILDING SOCIETIES: Although the first specific legislation in England respecting building societies took place in 1836, it was not until the Act of 1874 that they could become incorporated. The chief of the pre-existent unincorporated societies is the Birkbeck Building Society, which has 19,397 members, with annual receipts amounting to nearly twenty-three millions sterling (1907). In 1875, the first year after the new Act, English building societies showed total liabilities and assets at an approximately level thirteen millions sterling, and 100,000 members. Following the famous Liberator collapse, a remarkable decline took place, which reached its lowest level in 1894, after a drop in assets of ten millions sterling. The new Incorporation Act of 1894 restored confidence, but no appreciable upward tendency was maintained until 1897. The returns to the end of 1906 show that the incorporated societies have £55,894,000 assets; the assets of sixty unincorporated societies amounting to £16,000,000. The incorporated societies showed liabilities £54,343,184, and unincorporated £16,005,813. 614,424 people belong to building societies, and during 1906 alone there were 29,000 who began buying their own houses in this way. (See also BUILDING ASSOCIATIONS, page 136.)

BURIAL REFORM AND CREMATION SOCIETY, Ltd., THE SCOTTISH: Founded in 1895. The whole funds are devoted to the cause of cremation, as the society is precluded by its constitution from paying any dividend to its shareholders. The total number of cremations carried out since the inception of the crematorium at Maryhill, Glasgow, is 286. Hon. Presidents, Sir Charles Cameron, Bart., M.D., LL.D., and Rt. Hon. Robert Farquharson, M.D., LL.D. *Hon. Secretary:* Mr. John Mann, Jr., M.A., 142, St. Vincent Street, Glasgow.

C

CANINE DEFENCE LEAGUE, NATIONAL: Founded in 1891. Membership, 4875. The League has a Bill before Parliament for the exemption of dogs from vivisection. It is supported by a national petition over ten miles in length, and a medical petition signed by 1250 doctors. *Secretary:* Mr. Benjamin Bryan, 27, Regent Street, London, S.W.

CAPITAL PUNISHMENT, SOCIETY FOR THE ABOLITION OF: Founded in 1901. Object: The exclusion of various forms of homicide from the category to which the death penalty is applied, and the ultimate complete abolition of capital punishment. President, Dr. Josiah Oldfield, M.A., D.C.L. Chairman of Indian and Colonial Committee, Sir Henry Cotton, M.P., K.C.S.I. *Hon. Secretary:* Mr. Carl Heath, 145, New Kent Road, London, S.E.

CATTLE-DRIVING: During the years 1907-8 discontent among the agricultural population of Ireland developed to an extent which seriously threatened the cattle-raising industry—cattle-driving, boycotting, and intimidation being resorted to in various parts of the country by organizations against whom the police were in most cases powerless. The cattle were invariably driven a considerable distance from the farm and then turned loose on the highway, the owner being left to recover them as best he could. A deputation from the Irish Landowners' Convention waited upon the Chief Secretary at Dublin Castle on December 13th, 1907, to urge the necessity of taking steps to put a stop to the disorder prevailing, which was paralyzing credit and interfering with the staple trade of Ireland. The Rt. Hon. Augustine Birrell, in replying to the deputation, held that the prices of cattle had not been affected, and as to prospective injury to the owners of the land when it came to be sold to the Estates Commissioners and the Congested Districts Board, the value of the land was fixed by valuers and would be in no way affected by cattle-drives having taken place on it. On the other hand, members of the deputation maintained that the object of the cattle-driving was to intimidate the holders to surrender the farms, so as to force the landlord to sell at the lowest value. According to an Irish Office White Paper, during six months ended in June, 1908, there were 418 cattle-drives in Ireland. In the same period there were ninety-eight prosecutions in connection with these offences, 845 persons being bound over to keep the peace.

CENTRAL PUBLIC HOUSE TRUST ASSOCIATION: Thirty-eight Trust Companies have been formed, over 250 public houses are under management, and the number is steadily increasing. President, The Earl of Lytton. (See also page 155.)

CHILD LABOUR: *Child Workers and Wage-earners* forms the title of an exhaustive paper delivered by Miss Nettie Adler (Hon. Sec. to Committee on Wage-earning Children—*q.v.*) on March 17th, 1908, and published in the June number following of the *Journal of the Royal Society of Arts*. Miss Adler points out that despite the measures adopted in various directions to

guard the welfare of the child, particularly in the matter of work,

"Half-time employment, more especially in the textile manufacturing districts, has increased during recent years by leaps and bounds. The last returns published in the Report of the Board of Education for 1906–7 show that 82,328 children were working as partial exemption scholars in 1905–6 against 80,328 in 1904–5, and 78,876 in 1903–4. The Annual Report of the Chief Inspector of Factories and Workshops also shows that 42,613 children were examined for certificates of fitness in the United Kingdom during that year, in order to enable them to be employed as half-timers. Of this number 23,728 were to work in Lancashire and 10,063 in Yorkshire. These figures, however, do not by any means exhaust the number of children engaged in various occupations and yet attending school. Besides the total of 82,328 half-timers noted in the Report of the Board of Education, it is estimated that there are at least 200,000 children attending school full time and working out of school hours, early in the morning and late in the evening, at a variety of occupations ranging from street trading, milk selling, and shop errands to domestic work and home industries.

"The total number of hours worked gives a weekly average of about 27½ hours. Saturday morning work is only permitted to be done on alternate Saturdays.

"Dr. Crowley, the Medical Officer of the Bradford Education Committee, recently obtained replies from fifty-two head teachers regarding the physical effect of half-time work on the children in their schools; thirty-seven declared that the system was most injurious to the child's physique.

"The average earnings are from 2*s.* 6*d.* to 4*s.* 6*d.* weekly.

"The Parliamentary Return for 1899 showed that 76,173 children out of a total of 144,026, or rather more than one-half, were employed in or for shops.

"About twelve per cent., or 17,617 of the total number of children employed, are described as engaged in street trading—either selling newspapers or hawking goods.

"The case of children engaged in home industries has recently received a good deal of attention owing to the Select Committee on Home Work which reported in August, and also to the interest aroused by the various Sweated Industries Exhibitions which have been held in several large towns. The Parliamentary Return showed that 35,494 children were engaged in various forms of domestic work in 1898, but it is difficult to determine how many of these were engaged in some form of industry also. In the introductory memorandum of the Return, 12,646 children are shown to be engaged in piece-work, such as brush-making, basket-making, matchbox-making, rag-sorting, while 4019 girls are shown to be employed in dressmaking, shirt-making, mantle-making, tailoring, beading, belt-making, and other similar occupations.

Home Industries

"It is difficult to investigate the number of children engaged in agricultural operations; the Parliamentary Return of 1899 puts the number at 6115, but the Inter-Departmental Committee were of opinion that if hop-pickers and fruit-pickers were included, the number would be much greater; their estimate was fifty thousand.

"The investigation made by Dr. Thomas, the assistant medical officer of the London County Council, during 1905, showed distinctly how deleterious was the effect of this labour. If this investigation had dealt with a larger number of children, and had been available during the deliberations of the Inter-Departmental Committee seven years ago, it is not improbable that we might have seen child employment prohibited altogether. The facts obtained are of vital interest and importance. Dr. Thomas carefully examined 340 boys engaged at work in fourteen boys' schools, representing an attendance of 3864 children. He showed distinctly that in those working twenty hours or less, fifty per cent. showed fatigue signs, thirty-four per cent. anæmia, twenty-eight per cent. severe nerve signs, fifteen per cent. deformities, and eleven per cent. heart signs. Of those working twenty to thirty hours, eighty-one per cent. showed fatigue signs, forty-seven per cent. anæmia, forty-four per cent. nerve signs, twenty-one per cent. deformities. Of those working over thirty hours, eighty-three per cent. showed fatigue signs, forty-five per cent. anæmia, fifty per cent. nerve signs, twenty-two per cent. deformities, and twenty per cent. severe heart signs. Dr. Thomas also differentiated between the effect which employment had on boys engaged in different types of occupations.

"Educationally the effects are also bad. Of the 103 boys whose cases were so carefully investigated by this head teacher, fifty-four were described as being 'dull' or 'very dull,' 'back in their work,' or as having been degraded a standard. Dr. Thomas also found, in the course of his 1905 inquiry, that out of the 330 boys carefully examined, 209 showed retardation in school work, eighty-six being one standard, eighty-three two standards, and three four standards behind that corresponding to their age.

"Girls equally show the effects of over-work. In the same report, the Medical Officer for Education gives some details of cases of over-pressure discovered in girls' schools. Dr. Marion Hunter found that carrying heavy weights and minding babies are often the means of bringing about lateral curvature and flat-footedness. Quite recently nine out of twenty-three girl wage-earners, seen in a South London school, were described by the head mistress as being very delicate, and their appearance bore ample testimony to this fact, though no scientific inquiry was possible.

"Another important conclusion has been arrived at by the Council's medical officers in the course of investigation—that as a rule it is the children above the average in physique and exceptionally brilliant mentally who go to work. The evil effects are shown later, when the best capital of the nation has been squandered in premature wage earning.

"The effect of bye-laws carefully enforced is favourably commented upon by local authorities who have had an opportunity of watching a year's working of their regulations. Two important results are noted by a local authority on the borders of London.

"1. A reduction has taken place in the number of school children employed by tradesmen, as they have been replaced by boys who have left school and who work full time.

"2. A reduction has taken place in the number of school children employed as house boys, as they have been replaced by girls who have left school and who work full time as domestic servants.

"No remarks could illustrate better the true relation between child labour and unemployment. One further point remains to be dealt with. Is the labour of the child of vital necessity to the home? It is, of course, not possible to dogmatize absolutely on the matter, but it is worth while bringing to your notice some facts submitted by the Committee on Wage-earning Children to the Inter-Departmental Committee. Particulars were obtained of the incomes of 802 London families whose children were employed out of school hours. In only 143 instances were the earnings found to be under 20*s.* weekly; in 189 it ranged between 20*s.* and 25*s.*; in 154 between 25*s.* and 30*s.*; and 316 families were returned as having an income of 30*s.* and over. Similar results were obtained from Bradford, Leeds, Gateshead, Coventry, and Plymouth, typical towns in different parts of the country. Of 714 cases investigated more than half had an income of 30*s.* and over, while in 258 instances it was shown to be over 35*s.* It will, therefore, I think, hardly be gainsaid that, while cases of individual hardship might ensue in the total prohibition of juvenile labour, the gain to the children physically and educationally, and the economic improvement possible through the opening of new avenues to adult employment, are factors of the most vital importance."

Margaret Alden, M.D., in *Child Life and Labour*, devotes a chapter to "the child wage-earner," dealing more especially with the movement for restricting the employment of school children, and the problems still pressing for a solution in relation to child life. Referring to the necessary medical certificate required by children and young persons under sixteen before they can obtain employment in a factory, it is shown that, according to the latest returns issued (1906), 385,415 children and young persons applied and were accepted, 201,143 being boys and 184,272 being girls. Of these, 79,158 between thirteen and fourteen were granted certificates for full-time employment, while half-timers proper, in the last complete year, included 20,790 boys and 21,259 girls. On the question of wages—and the writer points out that the economic aspect of this underpaid labour is hardly less serious than the moral and physical results that accrue—reference is made to the report of the Inter-Departmental Committee on Physical Deterioration issued in 1904. There it is found that in 784 cases the payment was under 6*d.* per week; that in 47,273 cases it was between 6*d.* and 1*s.*, while the average is about 1*s.*, a pittance which is eked out by slender gifts of food and clothing.

Medical Certificates

At a conference held in Manchester in October, 1907, under the auspices of the National Union of Women Workers, Mrs. George Cadbury drew strong attention to the problem of child labour in the course of her presidential address. She stated that the Committee appointed to investigate the employment of children in England found that 300,000 still in attendance at school were at work after school hours. A boy of eleven years of age was employed for forty-three hours a week for 4*s.* in carrying parcels, so practically every moment of his life was spent at school or at work from seven in the morning till nine o'clock at night. Four sisters, aged eight, nine, ten, and twelve, were employed forty-four to fifty hours a week wood chopping.

CHILDREN'S CHARTER: A notable advance in public opinion in the direction of child protection, particularly in preserving the young from the contamination of the gaol and the law courts, was indicated in this important measure, introduced in the House of Commons by Mr. Herbert Samuel. The Bill, which passed the

third reading and was sent to the House of Lords on October 19th, 1908, is described as a Bill to consolidate and amend the law relating to the protection of children and young persons, reformatory and industrial schools, and juvenile offenders. Its clauses contain some important departures in the legal provisions for the protection of infant life, the treatment of juvenile offenders, etc. The evils of child-farming are guarded against by the powers given to the local authorities for the due inspection of homes where infants are received for reward, and the decision as to the suitability of the foster-parents to undertake their care. Such persons, too, will not be permitted to have any interest in policies of life insurance on the infants in their charge. Cruelty and other and criminal offences in relation to children and young persons are met by adequate measures of punishment of offenders. Juvenile smoking also comes in for a good deal of attention, and a penalty is placed upon the selling of tobacco to persons apparently under the age of sixteen years. Reformatory and industrial schools take up a considerable number of the clauses of the Bill, which fully covers this section of reform treatment. From the social point of view, however, perhaps the largest interest has centred in the provisions made in regard to juveniles detained in the custody of the law. The Bill endeavours to guard against contamination of the young in this respect by placing upon the police the duty, wherever practicable, of keeping young prisoners apart from association with adult offenders. Certain restrictions are placed upon the punishments to be meted out, and a young person is not to be sentenced to penal servitude for any offence, while in the case of children and young persons the death sentence is abolished. Every police authority is required to provide places of detention for its district. Objections to young persons being present for trial or otherwise in courts where they require to mix with adults, are met by the provision of juvenile courts. In the matter of the safety of children at entertainments, a number of provisions are made regarding the construction of buildings and control of the movements of children and other persons admitted.

CHILDREN'S DINNER FUND: (See London Vegetarian Society and Association.)

CHILD-STUDY SOCIETY, LONDON, THE: Founded in 1894. Object: The scientific study of the mental and physical conditions of children, and also of educational methods, with a view to gaining greater insight into child-nature and securing more sympathetic and scientific methods of training the young. Membership, over three hundred. Official organ, *Child-Study*, quarterly, 6*d*. Chairman, Sir Edward Brabrook, C.B. *Secretary:* Mr. W. J. Durrie Mulford, Parkes Museum, Margaret Street, London, W.

CHINESE LABOUR: Following the victory of the *Hit Volk* party at the South African elections in 1907, the provisions of the British Government, to which the party were pledged, came into force, and the Chinese who had been admitted into the Transvaal have been returned as their contracts expired. The total admitted were 63,453, and the largest number in the Transvaal on any one day (January 31st, 1907) was 53,856. Since that date to July 31st, 1908, 35,443 Chinese have been returned, making the total in the Transvaal on July 31st, 1908, 18,413. During that month alone 18,413 Chinese were repatriated, and it is calculated that the whole will have gone back by the end of 1909.

In Canada the Chinese population is to be found chiefly in the west, in British Columbia; there are only comparatively few in other provinces.

The Dominion has framed an Act respecting and restricting Chinese immigration, shortly known as the Chinese Immigration Act. A few of the features are: Every person of Chinese origin, irrespective of allegiance, shall pay into the Consolidated Revenue Fund of Canada, on entering Canada, at the port or place of entry, a tax of five hundred dollars, except the following, who shall be exempt: (*a*) Members of diplomatic corps, other Government representatives with their suites and servants, consuls, and consular agents; (*b*) the children born in Canada of parents of Chinese origin who have left for education or other purposes; (*c*) merchants, their wives and children, wives and children of clergymen, tourists, men of science, and students.

No vessel carrying Chinese immigrants to any port in Canada shall carry more than one such immigrant for every fifty tons of tonnage.

The owner of any vessel carrying Chinese immigrants to any part of Canada incurs a penalty of two hundred dollars for each Chinese immigrant carried in excess of this proviso.

If the master of any vessel permits a Chinese immigrant to land without a Government permit he incurs the penalty of five hundred dollars.

In the Commonwealth of Australia, where the Chinese largely find employment on the banana plantations, a law has been framed which will have the effect of restricting in every possible way Chinese immigration.

Chinese are to be found chiefly in Queensland, and Western Australia, and Victoria.

In Victoria a considerable number are employed in cabinet-making and furniture trades. The Government of Victoria demands that all such furniture shall be branded as Chinese manufactured. This is to protect the Colonial workman, as the Chinese work for low rates of pay.

In Western Australia Chinese are chiefly engaged in mining, though their efforts are mainly confined to surface operations.

On the whole, the Chinese in Australia are hard-working and thrifty, and make good citizens. They are generally charged with great immorality, which in many instances is undoubtedly true.

The Chinese question is also one of growing importance in New Zealand. A Bill is in the House of Parliament at present dealing with Asiatics generally. (See also page 195.)

CHRISTIAN SOCIAL UNION, THE: Founded in 1889. Object: To claim for the Christian law the ultimate authority to rule social practice. The membership is about six thousand in England, in sixty-two branches, apart from the affiliated societies in America, Australia, and New Zealand. The special work of the Union includes housing and sanitary reform, and "White Lists" for preferential dealing, to prevent sweating. Official organ, *The Economic Review*, quarterly, 3*s*. President, The Bishop of Birmingham (Dr. Gore). *Hon. Secretary:* Rev. J. Carter, Pusey House, Oxford.

CHRISTIAN SOCIAL SERVICE, THE NATIONAL UNION FOR: Founded in 1895. Objects: (1) The promotion, encouragement, and carrying on of Christian social service among all or any classes of the community, and the establishment of branches and auxiliaries in all countries; the holding of conferences and public meetings; (2) The dissemination of literature and information on cognate subjects, and the investigation, promotion, and adoption of any methods which may, in the opinion of the council, be calculated to bring about a better organization of Christian service and the upraising of the fallen and submerged; and (3) The training, maintenance, care, or assistance of any person in need thereof, including any persons who may be received by the Union from any Board of Guardians, Local Authority, or other body or person, on the payment to the Union of such sums as shall be agreed upon.

The Union supports a training colony for unemployables at Lingfield, Surrey, as approved of by the Local Government Board; Epileptic Homes and Schools at Lingfield, as certified by the Board of Education; also at Starnthwaite, near Kendal. Official organ, *Social Service*, monthly, 3*d*. President, The Earl of Meath, K.P. *Secretary:* Mr. John Hughes, F.R.G.S., 34, Paternoster Row, London, E.C.

CHURCH ARMY, THE: Founded in 1882. Object: General rescue work. The movement was commenced by the Rev. Wilson Carlile of Kensington in the slums of Westminster, and has steadily grown into national importance. The following figures somewhat indicate the scope of the Army's operations within a twelvemonth: Days' work provided in labour homes and relief depôts, 507,538; meals supplied, 2,074,653; ex-soldiers received by the society in labour homes, 1607; convicts, prisoners, workhouse and casual ward inmates received by the society in labour homes, 4239; poor and unemployed people assisted to Canada, 1500; missions held by Diocesan vans since the work began number 14,045. Total receipts for the fiscal year ending September 30th, 1907, were £247,000. Official organ, *The Church Army Review*, bi-monthly, 2*d*. President, The Earl of Meath, K.P. *Hon. Chief Secretary:* Prebendary Wilson Carlile, 55, Bryanston Square, London, W.

CHURCH SOCIALIST LEAGUE, THE: Founded in 1906. Object: To spread the principles of Socialism within the Church of England. The membership is about seven hundred. Official organ, *The Optimist*, quarterly, 6*d*. President, Rev. G. A. West. *Secretary:* Rev. J. H. Hastings, Halton, Lancaster.

CITY OF LONDON: (See under LONDON, CITY OF.)

COAL SMOKE ABATEMENT SOCIETY: Founded in 1898. Object: To prevent the emission of black smoke from factory and other chimneys, and to encourage smokeless methods of heating. The society employs inspectors to take observations of chimney shafts and to give evidence where necessary in support of prosecutions instituted by sanitary authorities. The testing of grates and gas fires has led to significant improvements in domestic heating; smokeless fires have been tested and stokers trained. Membership, 520. President, Sir William Richmond, K.C.B., R.A. *Secretary:* Mr. Lawrence W. Chubb, 25, Victoria Street, Westminster, London, S.W.

COMMONS AND FOOTPATHS PRESERVATION SOCIETY, THE: Founded in 1875. Object: To assist private individuals or local authorities when cases arise involving the preservation and protection of commons, village greens, roadside wastes, open spaces (such as disused burial grounds and fuel or other allotments), rights of way by land and water (such as roads, bridle-ways, footpaths, or ferries), and fishing and foreshore rights. Seven hundred cases are dealt with each year, and nearly all modern legislation with regard to highways and commons has been initiated by the society. President, Lord Eversley. *Secretary:* Mr. Lawrence W. Chubb, 25, Victoria Street, Westminster, London, S.W.

COMPARATIVE LEGISLATION, SOCIETY OF: Founded in 1895. Object: To furnish information on matters of interest and importance to jurists, statesmen, and sociologists throughout the world. Official organ, *Journal of Comparative Legislation*, 5*s*. President, The Earl of Rosebery. *Secretary:* Mr. Edward Manson, 5, New Square, Lincoln's Inn, London, E.C.

CONGESTED TRAFFIC PROBLEM: (See under LONDON.)

CONGO QUESTION, THE: Attacks through public lecturing in the principal towns of England, and a newspaper campaign exposing the horrors of the Congo Free State administration, aroused strong public opinion on this subject. It is considered that to this, with like efforts in the United States and other countries, and efforts of the Congo Reform Association, is due the annexation of the Free State to Belgium, which took place on August 20th, 1908, after a long discussion in the Belgian Chamber. The voting showed eighty-three for, fifty-four against, and nine abstentions. The Senate later ratified the action of the Chamber, and of the various Powers interested most have, at the time of going to press, intimated their agreement. The history of the Congo Question anterior to the above culmination is given on page 270, etc.

REFERENCES: H. R. Fox-Bourne, *Civilization in Congoland; Consular Reports on Congo;* E. D. Morel, *Red Rubber.*

CONGO REFORM ASSOCIATION: Founded in 1904. Object: To secure for the natives inhabiting the Congo State territories the just and humane treatment which was guaranteed to them under the Berlin and Brussels Acts, by the restoration of their rights in land, and in the produce of the soil, of which pre-existing rights they have been deprived by the legislation and procedure of the Congo State. Membership, about five thousand. The association has compelled exposure of Congo misrule, and forced the question to the front rank of international problems. President, Lord Monkswell. *Hon. Secretary:* Mr. E. D. Morel, 4, Oldhall Street, Liverpool.

CONNRADH NA GAEDHILGE: (See GAELIC LEAGUE.)

CONSUMPTION: (See under TUBERCULOSIS.)

CO-OPERATION: Some idea of the phenomenal growth of the co-operative movement may be gathered from the fact that whereas in 1893 the share capital of the companies in Great Britain and Ireland was £14,518,738, at the annual meeting in August, 1908, it was announced as amounting to the large total of £32,055,229. The annual sales, which in 1893 were of the value of £49,051,036 from 1,265,980 members, amounted in 1907 to £105,717,699 from a membership of 2,434,085, the number of societies in existence being 1582.

Mr. D. J. Shackleton, M.P, in his speech on the occasion of the opening of the Twentieth Annual Co-operative Exhibition at the Crystal Palace on August 19th, 1908, gives the following additional figures, as showing the position of the Co-operative Society in the United Kingdom: Loan capital, £9,870,198; (Share capital, see above.); profits in 1907, £12,003,341; devoted to education, 1907, £93,435; devoted to charitable purposes, 1907, £57,003.

Referring to the Co-operative Wholesale Societies and the rapid growth of their powers as producers, he said the Co-operative Wholesale was a federation of 1139 co-operative societies with a membership of nearly 1,800,000. Established in 1864, in its first year it supplied goods to the value of £51,857, while in 1907 its net sales reached the enormous total of £24,800,000. Besides acting as wholesale merchants, the society had invested over £2,000,000 of co-operatives' savings in the erection and equipment of factories for the production of such articles of food as flour, biscuits, sweets, jam, pickles, butter, bacon, chocolate, and all kinds of clothing and boots and shoes, household goods, such as furniture,

brushes, soap, candles. The output from the C.W.S. factories in 1907 came to nearly £6,500,000. The banking department of the C.W.S. forms an important branch of its business. In 1907 its turnover amounted to £120,000,000. In addition to the great productive works of the wholesale societies, there was the productive work carried on under the labour co-partnership system. This again showed steady, though not great, progress. The figures for 1907 were as follows:—

Progress

Societies	106
Total capital	£686,852
Trade	£1,302,812
Profit	£54,148
Loss	£4,119
Dividend on wages	£8,885

In Ireland little encouragement was afforded the co-operative movement until, in 1888, Sir Horace Plunkett and Mr. J. C. Gray (General Secretary, Co-operative Union) directed their energies towards the land, which resulted in the establishment in the following year of the first co-operative dairy. This was at first organized as a section of the English Co-operative Union, but in 1894 the Irish Agricultural Organization Society was formed in Dublin upon an independent footing. The three main departments of co-operation as at present ruling in order of importance are (1) Dairies, (2) Supply Societies, (3) Egg and Poultry Societies; and a few flax societies in the North are of some consequence. The following statistics are given in the report of the Agricultural Organization Society for 1906:—

Ireland

	No. of societies.	Members.	Turnover.
			£
Dairies (called Creameries) } Auxiliaries separately registered	270 } 13 }	45,201	1,507,040
Auxiliaries not separately registered	57	—	—
Supply (called Agricultural) Societies	159	13,063	73,175
Poultry Societies	29	458	1,427
Bacon-Curing Societies (established 1905)	2	3,500	—

The Agricultural Organization Society assists the weaker societies by means of contributions, but the lack of self-initiated enterprise and a spirit of confidence militates largely against the progress of co-operation in Ireland. Steady improvement, however, is shown in this branch of co-operation in Great Britain, where the Agricultural Organization in 1907 included 142 societies, comprising a membership of nine thousand, and trading to the extent of £350,000.

An exhaustive treatment of the earlier history and progress of Co-operation throughout the world will be found on pages 295 to 312.

CO-OPERATIVE ALLIANCE, THE INTERNATIONAL: Founded in 1895. Object: The organization of international co-operative congresses and development of co-operation in all countries. There are about 650 members in twenty-five countries. Official organ, *Correspondence Bulletin for the Co-operative Press.* President, Mr. William Maxwell. *Secretary:* Dr. Hans Müller, 6, Bloomsbury Square, London, W.C.

CO-OPERATIVE BANKS ASSOCIATION, THE URBAN: Founded in 1905. Object: To promote the establishment of People's Co-operative Banks in urban districts, formed, composed, and governed principally by working people for encouraging regular saving and granting small loans on easy terms of interest and repayment. The banks have now a membership of about one thousand, and make annual loans of about £5000 through these banks at Stepney, St. Pancras, Limehouse, Ratcliffe, South Bermondsey, North Lambeth, Northwood, Newport, Birmingham, Hull, Blackburn, Hitchin, Worthing, Chester, and Bolton. President, Mr. Robert A. Yerburgh. *Secretary:* Mr. Henry C. Devine, 39, Victoria Street, Westminster, London, S.W.

CO-OPERATIVE BROTHERHOOD TRUST, THE: Object: To utilize the spending power of the workers as a means toward their emancipation by capitalizing the profits gained in trading, for the purpose of employing their own members in producing their own necessities. *Secretary:* Mr. S. B. Goode, 37, Newington Green Road, London, N.

CO-OPERATIVE CONVALESCENT HOMES, LIMITED: Instituted in 1893. Object: To carry on the business of keepers of convalescent homes, and to trade as general dealers, manufacturers, and agriculturists. President, Mr. Andrew Young. *Secretary:* Mr. Adam Scott Brown, 263, Wallace Street, Kingston, Glasgow.

CO-OPERATIVE FESTIVAL SOCIETY, Ltd., NATIONAL: Founded in 1887. Object: To demonstrate the growth and influence of association amongst the working classes, and to promote the rational employment of their leisure by (1) The popularization of good music and the formation of choirs among the people; (2) The promotion of festivals in which music, flowers, sport, and industry each have a part; (3) Visits to places of historical and social interest, thus arousing an interest in the duties of citizenship. A festival is held in August of each year at the Crystal Palace, London. President, Mr. Aneurin Williams, M.A., J.P. *Secretary:* Mr. George Morriss, 6, Bloomsbury Square, London, W.C.

CO-OPERATIVE PRODUCTIVE FEDERATION, LIMITED: Registered in 1882. Object: To aid productive societies by united action; to open up a market for the sale of their goods; and to obtain capital for co-operative production. Fifty-eight co-operative societies in various parts of the country are affiliated with the Federation. According to the 1907 report the loans and interest of the Federation amount to £3533 12*s.* 7*d.*, and its trading transactions £54,979 5*s.* 7*d.* President, Mr. Joseph Craven. *Secretary:* Mr. R. Halstead, 17, Narborough Road, Leicester.

CO-OPERATIVE WHOLESALE SOCIETY, Ltd., THE: Founded in 1864. The Society carries on the business of merchant, manufacturer, shipper, banker, etc., and is the largest of the kind in the world. Its net sales for the year 1907 were £24,800,000. It comprises 1140 retail co-operative societies, having a total of 1,800,000 members. Official organ, *The Wheatsheaf*, monthly, gratis. President, Mr. John Shillito. *Secretary:* Mr. Thomas Brodrick, 1, Balloon Street, Manchester.

CO-PARTNERSHIP: (See under PROFIT-SHARING and CO-PARTNERSHIP.)

COUNTY COUNCILS ASSOCIATION: Founded in 1890. Object: By complete organization, more effectually to watch over and protect the interests,

rights, and privileges of County Councils, as representatives of the county ratepayers, as they may be affected by legislation, public or private, of general application to counties. All the County Councils in England and six in Wales are members. Official organ, *The Official Circular of the County Councils Association*, monthly, 3*d*. President, The Right Hon. Sir John T. Hibbert, K.C.B. *Secretary:* Mr. G. Montagu Harris, Caxton House, Tothill Street, Westminster, S.W.

CRIME: (See under PENOLOGY.)

CRUELTY TO CHILDREN: (See under PREVENTION OF CRUELTY TO CHILDREN, NAT. SOC.)

CREMATION IN GREAT BRITAIN: The following table shows the development of the burial reform movement:—

	No. of Cremations.			
	1905.	1906.	1907.	Total.
Woking	95	140	108	2988
London (Golder's Green)	252	298	290	1223
Manchester	97	90	96	1124
Glasgow	35	45	30	266
Liverpool	35	46	34	386
*Hull	15	17	29	131
*Leicester	16	12	12	54
Darlington	4	13	8	36
Birmingham	22	25	33	101
*City of London	9	23	18	50
*Leeds	16	15	16	47
*Sheffield	7	13	18	38
*Bradford	1	13	13	27
Total	604	750	705	6471

* Municipal crematoria, of which Hull was the first.

(See also THE CREMATION SOCIETY, and BURIAL REFORM AND CREMATION SOCIETY, SCOTTISH.)

D

DAYLIGHT SAVING BILL: One of the most remarkable of the Parliamentary Bills of 1908 was this proposal for utilizing the varying day-lengths to utmost advantage by a legislative Act which should give workers more leisure at the end of the day, save gas, electricity, etc. To quote Mr. Willett, the inventor of the scheme—

"My primary object in submitting the Bill is not to make people get up earlier in the morning, but to put an end to the appalling waste of daylight which goes on day after day for nearly six months in the year. The only way in which this wasted daylight can be effectively utilized for our enjoyment is by accepting two, three, or four Sundays in April, each rather less than twenty-four hours, such shortened Sundays to be obtained by moving on the hands of the clock twenty or thirty minutes between 2 and 3 a.m. We shall rise and retire at the same hours by our watches as we do now."

The scheme was the subject of much comment. Sir Robert Ball, Sir William Ramsay and Lord Avebury were among its supporters, and Sir David Gill—who made a similar experiment in South Africa whilst astronomer there—its most strenuous opponent. The Bill did not pass through the House of Commons. Messrs. Elders & Fyffes, Limited, of London, with eight hundred employés, and having branches throughout the country, put it into practical operation, to the content of employer and employed, in July, 1908. The scheme has also been actually adopted by two towns in Canada, and Australia is giving the idea serious consideration.

DECEASED WIFE'S SISTER: The Deceased Wife's Sister's Marriage Act, which came into force on August 28th, 1907, made legal marriage with a deceased wife's sister. Notwithstanding, certain clergy of the Church of England refused to recognize the enactment, and contracting parties have had to apply elsewhere for the performance of the ceremony. By this Act clergymen are still unable to marry the sister of a deceased wife. (See also MARRIAGE, page 754.)

DECIMAL ASSOCIATION, THE: Object: To promote the adoption of the metric system of weights and measures, and a decimal system of coinage in the United Kingdom. President, Mr. J. Emerson Dowson, M.Inst.C.E. *Secretary:* Mr. Edward Johnson, 605, Salisbury House, London Wall, London, E.C.

DISCHARGED PRISONERS' AID SOCIETIES, CENTRAL COMMITTEE OF: Composed of representatives of the various Discharged Prisoners' Aid Societies and others interested in the welfare of discharged prisoners, each subscribing society being entitled to appoint one representative on the Central Committee. Object: To promote co-operation amongst the societies in all matters of common interest. The Central Committee have taken steps whereby no prison in England is without a Discharged Prisoners' Aid Society working in connection with it. The chaplain is generally an active member of the Society, and a staff of probation officers, male and female, is engaged in assisting cases. Chairman, Sir Richard Harington, Bart. *Hon. Secretary:* Mr. W. S. Brough, Victoria House, 117, Victoria Street, London, S.W.

DISCHARGED PRISONERS, ROYAL SOCIETY FOR ASSISTANCE OF: Founded in 1857. Objects: To help prisoners—male or female—on their discharge from prison, by obtaining suitable employment for them, sending those who are fitted for it to sea or to friends abroad, and in other ways aiding and encouraging them to lead an honest life. Prisoners under the Borstal system receive special attention. In deserving cases the wives of prisoners are afforded assistance during their sentence, and their children are cared for. 32,436 discharged prisoners have been assisted since the foundation of the Society in 1857, 1254 receiving help during 1907. President, Mr. Samuel Whitbread. *Secretary:* Colonel J. G. Y. Wilson, 32, Charing Cross, London, S.W.

DISESTABLISHMENT COUNCIL FOR SCOTLAND: (See under LIBERATION SOCIETY.)

DOMESTIC SERVANT PROBLEM: (See under WOMAN WORKER, THE.)

DRINK TRAFFIC: The national drink bill continues to grow. According to an estimate of expenditure on alcoholic liquors during 1907, the quantity and money value for the United Kingdom and Ireland were as follows:—

England and Wales—	Quantity.	£
Spirits	28,066,010 gals.	42,099,015
Beer	29,978,176 brls.	89,934,528
Wine	10,430,496 gals.	9,441,447
British wines, cider, etc.	——	1,400,000
		142,874,990

	Quantity.	£
SCOTLAND—		
Spirits	7,718,389 ga's.	9,647,986
Beer	1,224,635 brls.	3,857,600
Wine	1,110,758 gals.	999,682
British wines, etc.		50,000
		14,555,268
IRELAND—		
Spirits	4,252,729 gals.	5,375,911
Beer	2,583,663brls.	8,138,538
Wine	740,505 gals.	666,455
British wines, etc.		50,000
		14,170,904
Total for the United Kingdom		£171,601,162

For comparative purposes it may be noted that Germany's drink bill is estimated at £150,000,000, and America's at £234,000,000. In proportion to population, if Germans and Americans spent the same on drink as Englishmen, the bills would be £270,000,000 and £362,000,000. (See the Rt. Hon. John Burns's calculation in his *Lees and Raper Lecture*, pp. 8, 9.)

By figures furnished on May 30th, 1907, by the Secretary of the Treasury, the licences for the last three years were as under:—

Licences to vendors of intoxicating liquors.	Year ended 31st March. 1905.	1906.	1907.
Publicans	66,239	65,990	65,853
Retailers of beer, cider, and perry	28,522	28,096	27,433
Retailers of beer and wine	4,845	4,756	4,711
Retailers of cider and perry	82	78	78
Retailers of wine	297	288	306
Sweets retailers (not publicans)	1,045	991	934
Total number of "on" licences	101,030	100,199	99,315
Publicans (part year) included in above figures	292	236	206

192 "off" licences were granted in 1905, and 211 in 1906.

(See also LICENSING BILL, LUNACY, CRIME, and page 716.)

DUMA, RUSSIAN: (supplementary to page 1087). The Third Duma was elected in the autumn of 1908. At its assembling there was a violent protest that M. Stolypin had packed it with bureaucratic adherents, but this Russian Parliament speedily proved itself to be genuinely democratic, for it rejected the Naval Budget by a vote of 194 against seventy-eight. The Russian papers warmly approved of this action. Even that semi-official organ, the *Novoye Vremya*, was loud in its praise. The Third Duma all through the critical summer of 1908 showed that it was neither radical nor revolutionary, but was possessed of a safe and sober conservatism blended with democratic aims. It was M. Guchlsoff, the leader of the Octobrist party, whose eloquent appeal to the Duma defeated the Stolypin Naval Bill.

DUXHURST COLONY: (See under TEMPERANCE PROBLEMS.)

DWELLINGS OF THE INDUSTRIOUS CLASSES, METROPOLITAN ASSOCIATION FOR IMPROVING THE: Founded in 1841. Membership about 750. Hygienically planned building blocks and cottages have been erected in various parts of London, the death rate in which is shown to be nearly one per thousand less than in the Metropolis generally. Chairman, Mr. Julian Hill. *Secretary:* Mr. Ed. H. Marston, 1, Pancras Square, London, N.W.

E

EARLY CLOSING ASSOCIATION AND TRADERS' PARLIAMENTARY ALLIANCE: Founded in 1842. The Association reports hours of service as improved in 9772 London shops in seven years. Chairman, Sir J. W. Benn, M.P. *Secretary:* Mr. J. Austen Stacey, 21, New Bridge Street, London, E.C.

EDUCATION IN LONDON: (See under LONDON).

EDUCATION, MORAL: The Conference on Moral Education at the end of September, 1908, at the University of London was attended by representatives from Germany, Russia, France, the United States, Hungary, Japan, as well as by leaders in education, sociology, eugenics, and ethical study in the United Kingdom. The many discussions and lectures gave indication of what each country deems essential towards the making of good citizens, and the creation in the rising generation of a spirit which shall desire for itself the highest progress and development alike of character, responsibility, the sense of national and civic duty, and the love of art and science. In connection with the Conference, Lady Grove, of London, wrote as follows on the question of moral education in rural districts:—

"We must admit the fact that village communities as they existed, say, one hundred years ago are no longer possible. The 'self-contained' interests of the squire, the parson, and the villagers, undisturbed by occurrences outside their own community, no longer claim the sole attention of even the smallest and most remote place where men, women, and children are congregated. Every inhabitant of every civilized community in the world is living on an international plane. Events of importance occurring in any portion of the civilized globe can be communicated to him within a few hours after their occurrence by the agency of the telegraph wires and the Press. The Feudal system is extinct. The poorest day-labourer is no longer the governed, but the governor, in the sense that he participates in the government of his country. It is not only his right, but it is his duty to know how the rest of the world is faring. In all countries there is an interchange of ideas in science, commerce, and conduct, all affecting the individual life of every community. A broadly based system of moral education, therefore, or a proper appreciation of the value of the ideas referred to above, is a new necessity, an international need, if the progress of the world is to be forwarded. Arising out of this educational advance would come a far higher view of morality than the one hitherto dreamed of either by teacher or taught. And it would become the normal view of every educated person. It would be borne in upon every child that he or she had a definite part to play in the furtherance of the welfare of the community in which his or her sphere of utility happened to be placed. In taking their stand as citizens of their own country, they would become worthy citizens of the world. This is no Utopian scheme. It is intensely practical, capable of being realized by the existing educational machinery throughout the world. It is no fresh discovery, but a readjustment of the forces already

existing and already consciously, and in some cases unconsciously, at work in the human mind. All it needs is recognition and practical application."

EDUCATION QUESTION: Many of the difficulties which are associated with this subject circle round the much-debated point of religious instruction. It was endeavoured to bring about a better understanding by the Bill of 1906, but it did not become law. It desired to take over, under certain conditions, the Voluntary (non-provided) schools, and continue them as provided schools. Where special religious instruction was required it could be provided, but not at the expense of the public.

The Bill excited a great deal of criticism and opposition. Thus Dr. Clifford said (May 26th, 1906): "The Bill went a long way towards complying with the nation's demands, but did not go far enough. To allow the parent a right over and above his right as voter to control public expenditure for a particular object, was preferential treatment of an individual because of his creed. In other clauses, too, the Bill tended to give permanence and vast expansion to an absolutely sectarian system."

Lord Hugh Cecil, who represented criticism in another direction, pointed out (June 16th, 1906) "the great danger of allowing undenominational religion to be alone recognized and approved by the State. It is an utter mistake to confuse the inculcation of this form of religion with elementary instruction in the Bible. It is emphatically 'a new religion,' which is absolutely inconsistent with and contrary to the teaching of the Church of England. Doubtless there is teaching given under the Cowper-Temple clause, which does not lead to undenominational religion. But the effect of the clause is unquestionably to produce in people's minds an impression that religion freed from what is peculiar to a denomination is something finer, more Christian, and more elevated than the teaching of the historic and universal Church. It is therefore a matter of life and death to the Church of England to oppose to the utmost undenominational religion."

A further Bill was brought in by the Rt. Hon. Reginald McKenna, President of the Board of Education, on February 26th, 1907, "to make provision for relieving the local education authority of the cost of giving religious instruction in schools, by making it compulsory for the managers of non-provided (sectarian) schools to pay to the education authority a sum equal to one-fifteenth of the sum paid during the year in salaries." This would represent an approximation of the cost of giving special religious instruction. The Bill passed its first reading, but was not further proceeded with, because, the Government explained, "we shall see our way to propose that we should undertake, next Session, the great task of putting the educational system of the country in order." The promised Bill was introduced in February, 1908, by the Rt. Hon. Reginald McKenna, as the "Elementary Education (England and Wales) Bill," and it at once aroused widespread criticism. On March 10th the Archbishop of Canterbury addressed a lengthy letter to the President of the Board of Education, in the course of which he said: "I need not, I think, remind you that I have myself from the first been anxious—many good people think over-anxious—to promote a reasonable settlement of this lamentable and harmful controversy. In order to bring about such a settlement, many of us are prepared to give up much which we believe might be fairly and reasonably claimed by those whose cause I, in some measure, represent. Some of us are even ready, for the sake of bringing about the harmonious co-operation for which we long, to acquiesce, both as regards primary and secondary schools, in arrangements which fail, as we think, to do what is ideally the best for English life as a whole. Entertaining that desire, I look forward with some measure of hope to a Bill which should give effect to your expressed conviction that, in enforcing the principles of public control and of freeing teachers from denominational tests, the Government must, 'at the same time have regard to the history of existing institutions and to the varied traditions, habits, and beliefs which exist among our people, and which to so many are the dearest part of their lives.'

The 1908 Bill

"Pray understand that I am not challenging or even criticizing the intentions which may underlie these provisions. The position is extraordinarily difficult, and it is my own desire, as I believe it to be yours, to reach a reasonable settlement, even if it cannot be wholly acceptable to the controversialists on either side. What I am reluctantly forced to contend is that the Bill as it stands does not present such a solution. I welcomed your words asserting the value of giving to the parent some right of choice as to the religious teaching of his child. That principle requires in practice to be qualified in various ways, but with the exercise of common sense it can, I believe, be made effective both in town and country. I had hoped to find it thus applied by the new Bill. But I do not so find it. I purposely avoid detailed and technical suggestions as to facilities and the like.

"Nothing can be so important to the well-being of England as the efficient education of the children in her schools, but 'education' must include the building up of character in the faith and fear of God. When such an issue is at stake, surely no mere sense of the weariness of controversy, still less any question of party allegiance, ought to prevail. No man worthy of the name will be tempted either by fear or favour to hold his peace."

Bishop Welldon approved of the Bill in the main if the Voluntary School grant were increased, and if regular school teachers were granted permission to give denominational teaching out of school hours.

The Committee of the National Society made a strong case against the Bill, their principal objections being—

The Case Against

(1) Because it proposes to terminate a controversy between two large and weighty bodies of opinion, favourable respectively to undenominational and denominational methods, by giving exclusive and universal predominance and possession within the system of State schools to undenominational religious teaching.

(2) Because instead of seeking a solution of present difficulties in a wider recognition of the right of parents to determine the religious teaching of their children, it ignores that right altogether over large areas.

(3) Because it forces undenominational religious teaching controlled by managers chosen without regard to religious considerations on all rate-aided schools, and destroys or imperils the present provision whereby definite religious instruction is secured for the children of parents who desire it.

The National Union of Teachers passed the following resolution: "Before expressing a favourable opinion on other features of the Education Bill, this executive offers uncompromising opposition to the contracting-out clauses, condemns them as vitiating fatally those principles of local public control and religious freedom for teachers which other clauses in the Bill are intended to secure, and emphatically affirms that the existence of contracted-out schools would cause immense and irreparable damage to education."

Secular Education

Mr. J. Ramsay Macdonald, M.P., wrote in the *Fortnightly Review* in April, 1908, in favour of secular education: "The nation is sick of this interminable and unchristian squabble. If half a dozen men on both sides were compelled to hold their tongues, or were forbidden to use the organization of the Churches for political purposes, the vast majority of parents would allow a

settlement to be made, for the people desire their children to be educated by teachers selected solely from their capacity to impart knowledge and to train the best that is in the child's personality."

The opinion of Lord Stanley of Alderley is thus given: "Let me say at once for myself, that in substituting a national municipal system for a dual system, nearly half of it under ecclesiastical influences, I am willing, if the denominational party will acquiesce in the change, to grant them what the Bill grants in transferred rural schools, the right to use all public elementary school buildings outside of school hours for religious teaching organized by themselves, given by teachers selected by themselves, to scholars whose parents wish them to receive it."

Canon Hensley Henson, of Westminster Abbey, argued that "The competence of the new Education Bill to secure general acceptance appears to depend on two points. In the single-school districts there must be provision made for the case of parents who desire denominational instruction for their children, and the contracting-out conditions in the urban areas must be such as neither to endanger educational efficiency nor to press unduly on the poorer parents. With these additions, neither of which violates its main principles, the Bill provides a basis on which men of good-will might reach agreement. It can inflict no injury on any Nonconformist, that during the religious instruction the children withdrawn under the conscience clause should be taught the Catechism instead of being set down to some secular subject, always provided that the Catechism be taught by the representative and at the cost of the Church of England."

His feeling against a secular solution was thus expressed: "There are great multitudes of morally derelict children who must find in the schools, to which they are mercifully compelled to resort, all the higher teaching which normally they should receive at home and the Church. These children must find in the schools all the education, in the good sense, which they will ever receive. The school teacher is to them parent and clergyman as well. If to the Cowper-Temple provisions could be added the security for the quality of the Bible teaching which the Christian training of the teachers implies, there would be removed from many minds the most serious argument against accepting a settlement on the lines of the Bill. The case of the elementary schools cannot be severed from that of the training colleges. If the latter remain effectively denominational, the former might safely become undenominational. Here, perhaps, the Government might find the basis of an arrangement with the Church of England."

The Rt. Hon. A. J. Balfour, the leader of the Opposition, defined the Bill as one which "in itself, for itself, and on its own merits has not, so far as I am aware, a friend in the House, and I cannot imagine one which seems to me to be less capable of being turned into a conciliatory measure."

Notwithstanding this frank criticism, the second reading was reached on May 19th, 1908, and a majority of 165 attained. In moving the second reading, the Rt. Hon. Reginald McKenna thus outlined the Bill: "The Bill of which I now move the second reading embodies the Government's plan for carrying out two cardinal principles in our educational system, the first that the public elementary schools of the country are to be placed under public control, and the second that there is to be no religious test on the appointment of the teachers. These are principles on which the Government insist, and they can admit of no modification of the Bill which would destroy those principles or which, by whittling them away, would turn fundamental principles into mere false pretences. The method adopted by the Government for establishing those principles is a simple one. It is proposed that only one type of public elementary school shall be recognized in the future. Such a school will receive both State aid and rate aid. It will be placed entirely under the control of the management of the local representative authority. The teachers in these schools will be appointed without religious tests, and no child not otherwise being educated will be compelled to attend any school except a public elementary school of the kind I have described. The religious instruction given in such schools will be of the kind with which we have been accustomed in this country ever since Mr. Forster's Act was passed in 1870. Such are the fundamental provisions of the Government Bill.

Second Reading

"The Government have proposed to deal with denominational schools in three different ways. In the first place, in single-school areas it is proposed that the managers of existing denominational schools may make it a condition of transfer of their buildings to the local authority that Cowper-Temple instruction of a certain definite kind shall always be given in their schools, and that facilities for giving denominational instruction shall be allowed. The second method adopted for dealing with denominational schools is to provide that Parliamentary grants, though not rate-aid, may be given to schools not in single-school areas which conform to all the requirements of the Board of Education as regards educational efficiency, but the managers of which do not desire to bring their schools under the conditions governing public elementary schools. The third provision is applicable to schools other than single-school areas, according to which the managers of denominational schools may make it a condition of the transfer of their schools that Cowper-Temple instruction of a definite kind shall continue to be given in the school. On educational grounds, the Government had no partiality for 'contracting out.' It was included in the Bill as a concession to denominational opinion, and he saw no other practical method of dealing with those schools in which it was proposed to submit the teachers to a religious test upon their appointment. If the spirit of partisan controversy could be allayed and a single eye be kept on the efficiency of education in this country, it ought not to be impossible for that House to come to an agreement to procure a lasting settlement."

The Bill, and also a conciliatory measure proposed by the Bishop of St. Asaph, were both ultimately held over at the Session's close.

Outside Party Politics

Two days after the second reading, the Prime Minister, the Rt. Hon. H. H. Asquith, said at the Reform Club: "As to the Education Bill, the remarkable feature of the debate in the House of Commons was the gradual convergence from the opposite quarters into the strong, genuine disposition to bring the scandalous controversy outside the range of party politics, to get rid of the petty embroilments, ecclesiastical, sectarian, and political, which had hampered the settlement for the last six years, by something in the nature of a general concordat, so that the little children of the country might have a really efficient, uniform, and universal system of education, by which brains and ability would get their due opportunity of doing service to the State.

There is a growing feeling in favour of a concordat. To that end the Rev. J. Guinness Rogers wrote in the *Fortnightly Review* for May, 1908: "Clerical-minded men of all Churches are sure to feel the difficulties which can be suggested most acutely, and while I personally should be glad that ministers of all Churches should agree to a self-denying ordinance by which educational work should be handed over to the laity, it would be very rash to expect that this would result in a shortening

of the controversy. I believe that it would be wise for the Minister of Education himself to summon a select company of such advisers.

"As to the results of such an action, I venture to hope that great advantage would result from approaching the subject at a new point, and to some extent with a new spirit. We are continually having new schemes, and our Ministers of Education have sought to meet the demands of opposing parties, in relation to them. In truth, nothing has more surprised me than the ingenuity of different parties in raising objections to any and every scheme. There has either been no real desire for a settlement, or each of the opposing litigants has been so bent on securing some favourite scheme of its own that it obstinately set itself against every other. At the root of the whole there has been an idea, largely mistaken, that both Anglicans and Nonconformists, to say nothing of Roman Catholics and others, were bent on securing a party triumph. This was an almost inevitable result of such antagonism, and all parties have been slow to perceive that the victory of any one would only mean a perpetuation of the struggle. The issue would be entirely changed if, instead of seeking the supremacy of any sect or party, we simply endeavoured to find a point of general agreement and to arrange our educational work accordingly. If we were to collect three or four intelligent and fair-minded English gentlemen, understanding the needs of the people and the work of education, and throw the whole subject upon them, we might be astonished at the large amount of agreement that would be reached."

EIGHT-HOUR DAY: In 1906 the Home Secretary appointed a Committee to inquire into the "probable effect of a limit of eight hours" to the working day of coal miners in Great Britain. After hearing a mass of evidence they reported in May, 1907, an average working day of 9½ hours, and advanced the opinion that "a legal limitation in hours underground to eight per day cannot be expected to produce any marked change." The reduction in output consequent on any reduction as that inquired into would approximate 25,783 tons per annum. The Committee suggested the advisability in the United Kingdom, as elsewhere, of the Government having powers of suspension and exception of any provisions in the public interest.

During 1906, 1907, and 1908 the matter was considered in Parliament. Under the name of the Coal Mines (Eight Hours) Bill, the Government brought in a Bill on July 1st, 1907, which, however, was not proceeded with. Similarly one brought in by the Miners' Federation, which proposed to limit the hours underground to nine hours during 1908, 8½ hours during 1909, and eight hours later, was dropped. In 1908 a further Bill was brought in by the Government and was read a second time on July 6th, the majority in favour being 270.

Notwithstanding the report of the 1906 Committee, the *Morning Post*, on July 7th, 1908, on the second reading of the latest Bill being passed, said—

"It must be said that the case for the eight-hour day is very strong, but so, also, is the case against. The case for the Bill is so strong that at any time during the past twenty years its second reading has been approved again and again by Parliaments of both political complexions. Every one feels that eight hours out of twenty-four is sufficient for any man to remain underground. Those who work in the mines, if they are not to become drudges, have a quite exceptional claim to leisure."

The Rt. Hon. Winston Churchill made an important speech in the House of Commons during the discussion on the second reading. Dealing with the question of the possible reduction of output, he said—

"For fifty years there have been continuous changes in the conditions of coal mining in this country. The hours have been reduced, the conditions of boy labour have been restricted, wages have been raised, compensation has been provided, and precautions against accidents have been multiplied. All these changes, the wisdom of which nobody disputes, from a purely and crudely economic standpoint, may be said to militate against production. But what has been the result? There has been one steady, unbroken expanse of output during the last fifty years. In the period of ten years ending in 1874, 76,000,000 tons were produced, in the next ten years 112,000,000, in the next ten years 145,000,000, in the next ten years 172,000,000, and in the last period of ten years 214,000,000—a figure which has been greatly exceeded since, if the average be taken. If it be admitted that there may be a certain reduction in output as a consequence of this Bill. . . . to me it seems certain that the small, temporary restriction will be lost in the general tendency to expansion, just as the recoiling wave is lost in the advance of the tide."

Looking at the other aspect of the question, Mr. Churchill said: "We believe that the well-being of the mining population, numbering some 900,000 persons, will be sensibly advanced in respect of health, industrial efficiency, habits of temperance, education, culture, and the general habits of life. We have seen that in the past the shortening of hours has produced beneficial effects in these respects. . . . But the general march of industrial democracy is not towards inadequate hours of work, but towards sufficient hours of leisure. That is the movement among the working people all over the country. They are not content that their lives should remain mere alternatives between bed and the factory. They demand time to look about them, time to see their homes by daylight, to see their children, time to think and read and cultivate their gardens—time, in short, to live."

The Bill in October, 1908, was in Standing Committee.

Present Hours

The following statistics of hours at present worked are of interest: 201,512 men work over eight hours; 10,091 boys work over eight hours, these figures being for hewers only. Some subdivisions of these figures are as follows:—

	8½–9	9–9½	9½–10	10–10½	10½–11
Men	54,348	49,898	51,265	15,136	5,622
Boys under 16	1,539	3,496	3,395	915	232

There are men returned as working up to fourteen hours at the face.

Including officials, other workers (besides hewers) at the face, such as fellers, etc., drawers, drivers, hauliers, road-makers, and repairers, pumpmen, furnacemen, etc., the grand total of men underground in the United Kingdom is—

Working over eight hours = 449,373
Eight and under = 131,710

A comparative table showing respective output, under different conditions is given below—

	Output tons per man	Hours. Day.	Hours. Week.	Accident death rate
East Scotland ..	446	8 h. 51 m.	46 h. 55 m.	1·22
Cardiff ..	302	9 54	54 59	3·71

On the general question of eight hours of labour, Mr. J. R. Clynes, J.P., M.P. (Labour member for Manchester, N.E.), has written—

"Whilst the universal or hasty adoption of an eight-hour day may involve certain confusion and changes,

steps could at once be taken, in all forms of municipal employment, in Government workshops, and in connection with public contracts, without any perceptible strain being felt from the alterations made. The State and public bodies can justly be called upon to set some example in the matter of better treatment to the workers, and in regard to a needful industrial reform.

"Numbers of the unemployed would undoubtedly be absorbed by introducing an eight-hour system in many of the trades in which employés are not affected by machinery and factory conditions. On our railways, tram-roads, canals, in public buildings, in the building trades generally, in various forms of vehicular traffic, work hours could be reduced and an opening made for thousands of the unemployed. In these trades there is no foreign competition, and in some of them there is no home competition. If the law compelled employers in these trades to fulfil a given condition, all would accommodate themselves to necessity and none be able to take advantage of another. A reduction in working hours would assuredly do much to reduce the percentage of accidents and injuries caused through excessive hours of work and the overstrain on human nature."

Sir Wm. Mather, part owner of the Salford Ironworks, Warwickshire, has had an eight-hour day in operation in these works for some years. He has decided views on the question, advocating the following: Any trade union in a district, being in favour of reducing the hours of labour, should, after conference with the employers, pass a resolution embodying the proposed rules for the working day in that trade in that district, and should then ascertain the opinion of the adult members of the trade in the district concerning the proposals. If the rules were adopted by a majority of the adult workers who voted, they would become law, and the local authorities would be bound to prosecute any employer or worker who transgressed them. Any alteration of the rules would have to be made in the same way. Reduction of the hours below forty-eight per week would be forbidden.

The ideas of the Fabian Society on the eight hours question have passed through a process of evolution. Many years ago, when they first debated the matter (1890), they were in favour of Trade Option, which provided that "where it is proved to the satisfaction of a Secretary of State that a majority of the persons employed throughout the United Kingdom in any one trade or occupation are in favour of the maximum hours of labour in that trade or occupation being fixed by law, or if already so fixed, being altered by law, he shall by order made under this part of the Act declare a maximum number of hours per day or per week for such trade or occupation."

For All Trades

The liberty, however, which this proposal left to trades of adopting eight hours or not did not prove acceptable, and the Trade Union Congress of 1892 voted that the provisions should apply to all trades except those who made a special demand for exemption. Out of this grew the proposal known as the trade exemption scheme, but on analysis of the details of its proposed working it was voted unsound and impracticable, and, like its predecessor, was abandoned in favour of the Trade Inquiry scheme which is now put forward by the Fabians as the best practical scheme they have been able to evolve. In essence this scheme, as outlined in *Fabian Tract*, No. 48, means that the Home Secretary (pending the creation of a Minister for Labour) would be compelled to hold an inquiry into the duration of the hours of labour in a trade or industry (*a*) when directed to do so by either House of Parliament; (*b*) when requested to do so by a county council, a town council, a duly registered trade union of the trade, or a trades council where there is no union; (*c*) on a special report from an Inspector of Factories. For the purposes of such an inquiry the Home Secretary would be bound to appoint a Commission of three persons, one of them a factory inspector, and one a woman in the case of trades employing women. The inquiry would embrace all trades directly dependent on the one mainly in question.

At the conclusion of the inquiry, the Commission would have to report (*a*) what appeared to be the prevalent opinion among the members of the trade or industry as to the reduction of their hours of labour by law; (*b*) the probable effect of such reduction on the trade or industry and the community; (*c*) what reduction of the hours of labour in the trade or industry was desirable, what should be the length of the working day and week, and what allowance should be made for emergencies, seasons, etc.; (*d*) whether the case was a suitable one to be dealt with by the local authorities of the districts affected by the trade or industry. The report, together with those parts of the evidence which were not confidential, would be printed and laid before Parliament.

Within three months after the presentation of the report, the Home Secretary would be bound either to report to Parliament his reasons for taking no action, or, if he determined to take action, to draw up an Order containing either (*a*) regulations prescribing the length of the working day and week, with such exceptions as he might deem advisable for emergencies, seasons, etc.; or (*b*) conferring upon county councils and town councils in defined districts the power of regulating the hours of labour in the trade within limits specified in the Order.

Even this scheme, they admit, would present many difficulties, as there are over eleven thousand different trades in the United Kingdom. The "universal" scheme would make it compulsory for all trades to adopt an eight-hour day without exception.

ELECTRICITY SUPPLY: (See under LONDON.)

ELECTRIC TRAMWAYS: (See under TRAMWAYS, ELECTRIC.)

EMIGRATION FUND, EAST END: Object: To assist poor British-born people of good character to emigrate to the British Colonies. Chairman, Mr. Townsend M. Kirkwood. *Secretary:* Mr. Robert Culver, 34, Newark Street, Stepney, London, E.

EMPLOYER'S LIABILITY: Up to 1906 compensation for injuries received in the course of employment was only legally provided for in connection with certain forms of labour, but the Workmen's Compensation Act of that year extended the scope of the legal enactment of 1897 to all employments, except a few expressly excluded. It also extended the right of compensation to cases of diseases resulting from certain processes. Before the Act can apply, however, the relationship of employer and workman must be constituted in law, and must exist at the time of the injury for which compensation is claimed. A contract of service must exist between the parties. Unless (subject to the terms of the contract) the right to control the alleged workman as to the time when and the manner in which he shall do the work exists, the relation of master and servant is not constituted, and the Act cannot apply. Further, the accident must arise "out of and in the course of the employment." The main provisions of the Act may be briefly summarized as follows:—

1. Every employer must compensate his workpeople for personal injury by accident arising out of and in the course of employment, provided—

(*a*) The workman must be disabled for more than a week.

(*b*) The workman may claim under this Act or general law, but not under both.

(*c*) If the injury is caused by the serious and wilful misconduct of the workman he has no compensation, unless the injury results in death or serious and permanent disablement.

2. The claim, if disputed, is to be settled by arbitration.

3. Certain diseases incidental to employments, if contracted, are to be deemed accidents.

4. A person not employed in manual labour and whose remuneration exceeds £250 a year, a person whose employment is "of a casual nature" and not employed for the purposes of the employer's business, an outworker or member of the employer's family living in his house are not included in the term "workman," but with that exception the term includes any person in service or apprenticeship.

5. Members of the workman's family dependent on his earnings, including illegitimate children and their parents, may share in compensation.

6. The schedules fix the scale and mode of settlement of compensation as follows:—

Compensation Schedules

In case of death leaving dependents, a sum equalling three years' earnings, not less than £150 nor more than £300.

If dependents not wholly dependent, a sum to be settled by arbitration.

In case of total or partial incapacity for work, a weekly payment during incapacity not exceeding fifty per cent. of average weekly earnings, or £1 per week.

The arbitrator may be agreed on, or the amount settled by a County Court judge.

It will be seen from the above provisions that every employer can calculate how many probable claimants may in his case exist, and he can only endeavour to protect himself from the certain burden and possible dispute and litigation arising by insurance.

Domestic Servants

Persons employed in domestic service come within the Act if their employment is of a continuous nature, but if the engagement is merely for an odd day they will not be affected. Again, a difference exists between a "servant" and an "independent contractor"; for instance, if a man agrees to clean certain windows at so much per window and is injured while so doing, he cannot claim compensation, since he is an independent contractor and not a servant as defined by the Act.

Where a servant, engaged in his master's business, is injured through the negligence of a third person, the workman may take proceedings against that person to recover damages. If, however, a servant has obtained judgment against a third person for damages his remedy for compensation from his master is gone, or if he has agreed to accept compensation from his master his right of action against any third person is gone. A servant "temporarily lent or let on hire" is, in case of accident, the servant, not of the hirer, but of the person from whom he is hired.

As to "contracting out," it is stated that "any agreement entered into between an employer and workman by which the workman, in the event of disablement, is to receive no compensation or less than he is entitled to under the Act, is worthless. The workman cannot be deprived of or give up his rights under the Act. The only 'contracting out' which is allowed must take the form of a scheme of compensation agreed to between an employer and his workmen (or a majority of his workmen), and certified by the Registrar of Friendly Societies. Such a scheme must, amongst other things, provide scales of compensation not less favourable to the workmen and their dependents than the corresponding scales contained in the Act."

ESPERANTO: This movement for the promulgation of an auxiliary language is progressing rapidly. At the Congress in Dresden, in August, 1908, it was mentioned that there were over 1057 groups of learners and speakers throughout the world. In 1902 there were twelve groups in Great Britain; at the time of the Dresden Congress 158 groups. In Germany, in 1903, there were but three groups; when the 1908 Congress was held there were eighty-seven. Similar progress was reported from many countries. In 1909 there will be two Congresses, one in America, and one in Spain, and arrangements are being made to hold the International Congress in Japan in 1912. As evidence of the progress of Esperanto it may be mentioned that thirty-nine different International Societies, not for the propagation of Esperanto, but dealing with commercial teaching, scientific and sociological matters, held their gatherings in Dresden, and made Esperanto their vehicle of communication. The organ of the organizing bodies of the Esperantists is the *Official Gazette*, 51, Rue de Chichy, Paris.

Earlier data on Esperanto will be found under LANGUAGES, page 700.

ESPERANTO ASSOCIATION, THE BRITISH: Founded in 1904. (Incorporated.) Object: To better promote the spread of the auxiliary international language, Esperanto (*q.v.*). Number of groups affiliated in June, 1908, was 122, the estimated number of group members being 2730, with seventy-three Fellows. Official organ, *The British Esperantist*, monthly, 3*d*. President, Lt.-Col. John Pollen, C.I.E., LL.D., R.V.R. *Secretary:* Mr. Harald Clegg, F.B.E.A., 133, High Holborn, London, W.C.

ETHICAL SOCIETIES, UNION OF: Founded in 1895. Object: To emphasize the moral aspect in all personal, national, or international relations, and to free the moral life from dependence on theology. The Union has two thousand members, and among the special work done is the founding of the Moral Instruction League, the Secular Education League, and the International Moral Education Congress. Official organ, *The Ethical World*, monthly, 1*d*. President, Mr. George A. Smith, B.A. *Secretary:* Mr. H. Snell, 19, Buckingham Street, London, W.C.

EUGENICS EDUCATION SOCIETY, THE: Founded in 1908. (For general objects, see under following entry.) The membership is two hundred. President, Sir James Crichton-Browne, F.R.S. *Hon. Secretary:* Mrs. Gotto, 6, York Buildings, Adelphi, Strand, London, W.C.

EUGENICS, THE FRANCIS GALTON LABORATORY FOR NATIONAL: Founded in 1904, having as its objects the study of agencies under social control that may improve or impair the racial qualities of future generations, either physically or mentally. Various memoirs have been issued on the Importance and Scope of Eugenics and on the Inheritance of Insanity, Tuberculosis, Cancer, etc., and on the Inheritance of Ability, Psychical Characters, etc. Conducted by Professor Karl Pearson, F.R.S., in consultation with Mr. Francis Galton, F.R.S., University College, Gower Street, W.C.

EXPORTS, BRITISH: (See under TRADE RETURNS.)

F

FABIAN SOCIETY, THE: In addition to the data given on page 460, it may be stated that in September, 1908, the membership was about 2700, including about twenty-five local societies. Official organ, *The Fabian News*, monthly, 1*d*.

FAIR HOUSE: (See under TRADE UNIONISM.)

FEEBLE-MINDED, NATIONAL ASSOCIATION FOR THE: Founded in 1896. Objects: To provide permanent care for the feeble-minded, to found homes and farm colonies for this purpose, to promote scientific research, and better legislation on their behalf, to give medical advice, etc. Chairman, Sir William Chance. *Secretary:* Miss A. H. P. Kirby, Denison House, 296, Vauxhall Bridge Road, Westminster, S.W.

FOOD AND BETTERMENT ASSOCIATION: Founded in 1893. Object: To supply food, shelter, clothing, and entertainment to the poor—including sandwichmen and rag-pickers—irrespective of creed, together with children's outings. The average number of resident uniformed workers is sixteen, living on a basis of self-sacrifice. Official organ, *The Welldoer*, bi-monthly, 1*d*. *Founder and Hon. Director*, Mr. H. Lee J. Jones, 119, Limekiln Lane, Liverpool, N.

FREE CHURCHES, NATIONAL COUNCIL OF THE EVANGELICAL: Founded in 1896. Objects: To facilitate fraternal intercourse and co-operation among the Evangelical Free Churches; to advocate the New Testament doctrine of the Church, and to defend the rights of the associated Churches, etc. There are over nine hundred local Councils and fifty district federations. Official organ, *Free Church Chronicle*, monthly, 2*d*. President, Rev. David Brook, M.A., D.C.L. *Secretary:* Rev. Thomas Law, Memorial Hall, Farringdon Street, London, E.C.

FREE TRADE: The Tariff Reform movement in Great Britain and its Colonies naturally aroused a counter-agitation by advocates of Free Trade, and the various associations formed throughout the country, as well as individual political opponents of the suggested change in fiscal policy, have by literature and speeches endeavoured to uphold the banner of Free Trade. The labours of the Imperial Tariff Committee and the Tariff Reform League have been met by the active endeavours of such bodies as the Cobden Club (*q.v.*), the most prominent Free Trade organization in the country; and the Free Trade Union (*q.v.*), formed in 1903. The propaganda of the Tariff Reformers has encountered strong opposition from these organizations.

An "International Free Trade Congress," arranged by the Cobden Club, was held at the Caxton Hall, London, in August, 1908. About five hundred delegates attended, and all the European nations were represented. There were also representatives from the United States of America, India, Canada, Australia, New Zealand, and Ceylon. Fidelity to the principles of Free Trade was, of course, the main matter of reference, the keynote of the speeches made being the intimate connection between Free Trade and the cause of peace. The opening of the proceedings was, however, noteworthy for the admission contained in the speech of the President, Lord Welby, that "Protection is advancing in an aggressive fashion, and the prospects of Free Trade throughout the world are somewhat cloudy."

As regards the Free Trade view of the resolutions passed by the Colonial Premiers at the 1907 Conference, reference to which is made in our article dealing with Tariff Reform, the reasons for the Home Government's dissent from these resolutions and refusal to depart from the existing system, in favour of a preferential treatment of the Colonies, were set forth in a speech delivered at the Conference by the Rt. Hon. H. H. Asquith, then Chancellor of the Exchequer:—

"How is it we have been able to maintain our position so far as we have maintained it, and I think we have on the whole maintained it very well? It is due to three things—In the first place, to our special productive activity as a people, which still keeps us, in many of the most important departments of production, at the head of the world. In the second place, it is due to the profits which we derive from keeping open to the whole world the biggest market which is to be found anywhere, so that London and England are the clearing-house in which a great part of the intermediate business, as I may call it, of the whole commercial world is done. And it is due in the third place to the earnings of our shipping, which does the carrying trade, as you know, for more than half the world. These are the means by which our wealth is maintained and secured, and they all depend, in the long run, upon our being able to maintain, unimpaired in quantity and unenhanced in price, the food of our people and the raw materials of our industries. Curtail the sources of supply, raise the cost of supply, and you strike a deadly blow at the very foundations of our whole industrial system. Our Free Trade system here is based upon practical considerations. It results from the circumstances which I have outlined to you, and so long as those circumstances remain we cannot without treachery, not only to our own convictions, but to what we believe to be the true and enduring interests of our people, abandon the foundations of that system."

Preference

The preferences given to the trade of the United Kingdom by the Colonies, which have been adduced as a favouring argument by the advocates of Tariff Reform, are much minimized by the opposite party, and the following table has been pointed to as contrasting British treatment of Colonial goods with that which is accorded to the trade of the United Kingdom by the individual Colonies:—

Imports (consignments) of Merchandise into the United Kingdom in 1906.	Free of duty.	Subject to duty.	Total.
	£	£	£
From Canada	28,019,668	15,363	28,035,036
From Australia	29,178,609	106,537	29,285,146
From New Zealand ..	15,618,850	163	15,619,013
From British South Africa	*6,327,476	16,894	*6,344,370

* Exclusive of diamonds from Cape of Good Hope, £9,179,333.

Imports of Merchandise from the United Kingdom.	Free of duty.	Subject to duty.	Total.
	£	£	£
Into Canada (year ended 30th June, 1906) (a) ..	3,406,000	10,815,000	14,221,000
Into Australia (1905) (b) ..	5,738,000	14,513,000	20,251,000
Into New Zealand (1905)..	2,484,000 (d)	5,300,000	7,784,000
Into British South Africa (1904) (c) ..	6,506,000 (a)	14,335,000	20,841,000

(a) Imports for consumption. (b) Imports of goods, the produce or manufacture of the United Kingdom. (c) Approximate figures. (d) Inclusive of the value of certain goods which are free of duty when the produce of the United Kingdom, but subject to duties when the produce of other countries.

It is asserted that Britain's gifts of free markets, free defence, and preferential loans to her self-governing Colonies much more than counterbalance any advantage she may receive from them in the direction of preferential treatment, as against the foreigner, for her manufactures.

The possibilities of gain to British trade from preferential treatment are considered a doubtful quantity. Of Canada it is said: "(a) The preference which Canada has voluntarily granted to British goods has had some slight effect in assisting us to compete in some lines with the United States; (b) there is no indication of the extent to which Canada would be prepared to increase that preference; and (c) there is no reason to expect that any further preference, which it would appear would have to be bought very dearly by us, would tend to divert any considerable amount of Canadian trade from foreign into British hands. The natural preference to which the proximity of the States to the Canadian market entitles them in that market could not be counterbalanced except by a very drastic tariff preference such as we have no reason to hope for under any conceivable circumstances."

The history of South African preference, it is contended, conveys no encouragement whatever to those who contend that the solidarity of the empire can be promoted by fiscal bonds. New Zealand's Preference Act of 1907 is, however, considered of most advantage to the Mother Country. That Act increased the total number of articles on which preference is given, if they are of British origin, to over two hundred. This preference is effected partly by increasing duties on foreign goods, and partly by levying new duties on foreign goods which were formerly on the free list. In no case are the former duties on British goods diminished. The conclusions regarding Australia are: "(a) that the new Australian tariff is calculated to afford the home producer high protection, not only against foreign countries, but against the Mother Country; (b) that the amount of trade which may be diverted by preference into British channels is but slight; and (c) that the loss to the manufacturers of the Mother Country promises to be greater than any gain which the preference may eventually vouchsafe to them."

U. K. Trade

The following figures relating to the foreign trade of this country are used in evidence of the soundness of the Free Trade policy, as tested by the prosperity of the nation:—

MERCHANDISE.

	1907.	1906.	1905.
	£	£	£
Imports ..	645,904,176	607,888,500	565,019,917
Exports—			
British and Irish ..	426,204,596	375,575,338	329,816,614
Foreign ..	91,972,141	85,102,480	77,779,913
Total ..	1,164,080,913	1,068,566,318	972,616,444

BULLION.

Imports ..	73,072,439	63,330,653	51,559,909
Exports ..	77,786,858	61,482,552	45,391,519

The national savings are also referred to on a similar basis (see THRIFT).

German industrial conditions are used on both sides of the argument, Tariff Reformers instancing thereby some of the advantages of Protection, while the contra side of the balance is agitated by the Free Trade party. As showing the unsatisfactory result of the working of the new German tariff, reference is made to the annual report of the Hamburg Chamber of Commerce, which contains the following statement:—

"The introduction of a new customs tariff, particularly when the same contains so many changes in its arrangement as the new German tariff which came into force on March 1st, 1906, must necessarily be attended with great difficulties for all concerned; that is to say, more especially for the commercial classes and for the customs authorities. In the case of the new German tariff, these difficulties have been greatly increased by its far-reaching 'specialization'; for it differentiates even between such articles as closely resemble each other in their nature and between which in many instances no difference is made by the trading public; and it is so complicated that, in order to ensure its correct application, it has been found necessary, in addition to the publication of an official list of dutiable goods (alphabetically arranged and provided with numerous notes), to issue also a volume of instructions, three hundred pages in length, to the German customs officers, and these instructions have, in their turn, been supplemented by numerous periodically published official directions for the use of the customs authorities.

Work Involved

"The study and the attention required for carrying out of all these instructions and directions in themselves alone make heavy demands upon the customs officials and upon the commercial classes concerned; more especially as many of the former customs regulations which were not directly affected by the introduction of the new tariff have now also been revised, a measure which might well have been postponed until some later time. What, however, is yet more serious is the heavy amount of work entailed upon the German customs authorities by the numerous very minute investigations and analyses necessitated by the new tariff, and these are, moreover, the cause of very great delay in the customs clearance of many different kinds of goods, and of the consequent accumulation of the latter in the customs-houses, thus creating a source of many difficulties for all concerned in their importation."

The difficulties in the way of collecting the duties as indicated in the above report are adduced as showing that in the event of Great Britain adopting Protection, an enormous number of customs officials would have to

be created. The general aspect of the position as regards foreign trade is thus summarized by the Free Trade Union—

"(1) That the proportion of total trade is very nearly constant, and has been much less checked by tariffs than might appear at first sight.

"(2) That our imports are being paid for partly by 'roundabout trade,' and partly, as is especially the case with the United States, by our shipping and other services.

"(3) That there probably is a change in the investment of our capital, more of which is going to the Unprotected group—a process which swells our exports to them for the present, and must swell our imports from them in the future.

"Now, the moral of this is plain. Part of our sales in the so-called 'neutral markets' are directly due to our purchases from protected countries. If we check these purchases there will be fewer 'bills on London' offered by Protectionist countries to the dwellers in neutral markets from whom they wish to buy. In other words, the check to our imports in one direction will harass our exports in another. Nor will this direct effect be the end of the matter. If we exclude the manufacturers of the United States and Germany from our own market they will compete with us more actively in South America and the East. The balance of our exports as between Protected and neutral markets may be partly redressed, but at cost of diminishing our total export trade. By Retaliation we can diminish our imports and so get less of what we need, but only at the expense of diminishing our exports and so being able to sell less of what we have to offer."

FREE TRADE CLUB, THE UNIONIST: Object: To unite and combine in common work free traders in all parts of the country who may, whether as Conservatives or Liberal Unionists, belong to the Unionist party. President, Earl Cromer, G.C.B. *Secretary:* Mr. E. G. Bunker, 38, Victoria Street, London, S.W.

FREE TRADE UNION: Founded in 1903. Objects: (1) To safeguard the free import of food and raw material; (2) to maintain the general principle that taxation should be imposed for revenue purposes only; and (3) to resist the fiscal policy proposed by Mr. Chamberlain, as tending to complicate relations with the Colonies and to endanger the stability of the Empire. A staff of organizers and speakers is ready at any time, in response to invitations from Parliamentary constituencies or other organizations, to address meetings, give lectures, or help in the work of political organization. In the case of bye-elections, the Union generally opens an office and sends down a large staff to conduct an extensive campaign on behalf of Free Trade. Official organ, *The Free Trader*. Chairman, Rt. Hon. Arnold Morley. *Hon. Secretary:* Mr. Charles Mallet, M.P., 8, Victoria Street, Westminster, London, S.W. (See also WOMEN'S FREE TRADE UNION.)

FRENCH INCOME TAX: (See INCOME TAX.)

FRIENDLY SOCIETIES: Remarkable progress has been made in friendly and benefit societies in the United Kingdom, as evidenced by the fact that in the two principal divisions, the ordinary friendly societies and branches of registered orders, each of which in 1877 only just exceeded a million members, in 1904 had each trebled their membership. Taking the term in its broad sense, and including trade union societies and co-operative societies, as does the Chief Registrar of Friendly Societies, some astonishing figures are revealed. Mr. J. D. Stuart Sim, the Chief Registrar of Friendly Societies, in November, 1907, made the following statement:—

There are in the United Kingdom 34,652 separately organized friendly societies and institutions having for their object the promotion and encouragement of thrift, with a total membership of nineteen and a half millions of persons, and accumulated funds amounting to £184,149,732. If to these be added the 15,297 savings banks with twelve millions of depositors, and funds amounting to £242,455,651, the result shows 49,949 institutions with over thirty-one millions of members, who, in one form or another, and, perhaps, in several forms, own the enormous capital of 426 millions of pounds sterling, an amount exceeding half the national debt of this country. The friendly societies proper show that at the last quinquennial, 1905, the total receipts during the year 1905 from members for benefit was £7,220,430, and the total payments £5,750,037, which included sickness pay (including medical aid), £4,079,022; sums at death, £865,929; and other benefits, £427,507. The balance of benefit funds at end of 1905 totalled £41,340,935 against £32,243,565 for 1899. The management fund showed aggregate receipts for 1905, £901,671; expenses of management, £816,582; and total expenses, £836,517; the balance of management funds at end of 1905 totalled £604,196 against £508,304 in 1896.

The following are comparative percentages:—

Ordinary Friendly Societies—

(*a*) General Societies (Male and female members)	Average contributions per member per annum	£·883
(*b*) Female Societies	ditto	£·621
(*c*) Juvenile Societies	ditto	£·388
(*d*) Branches of Registered Orders	ditto	£1·344
(*e*) Collecting Friendly Societies	ditto	£·391

(*a*)	Expended in benefits of each £1 received		£·749
(*b*)	ditto.	ditto.	£·822
(*c*)	ditto.	ditto.	£·621
(*d*)	ditto.	ditto.	£·714
(*e*)	ditto.	ditto.	£·363

(*a*)	Expended in management of each £1 received		£·090

FRIENDS, PEACE COMMITTEE OF THE SOCIETY OF: The religious Society of Friends founded by George Fox about the year 1650 has always maintained as one of its religious principles that all war is contrary to the spirit of Christianity and has consistently advocated a policy of national righteousness as the surest foundation of peace. The work of the Society in Great Britain with respect to peace, temperance, gambling, opium and other questions of national righteousness is under the care of the "Meeting for Sufferings," a body of representative Friends meeting in London once a month and acting with the help of sub-committees. Official organ, *The Friend*, weekly, 1*d*. *Address:* 12, Bishopsgate Street Without, London, E.C.

FROEBEL SOCIETY OF GREAT BRITAIN AND IRELAND, THE: Established in 1874. (Incorporated.) Object: To educate the public mind in all matters concerning the welfare of children, etc. President, Sir William Mather, LL.D. *Secretary:* Miss Temple Orme, LL.D., 4, Bloomsbury Square, London, W.C.

The address of THE NATIONAL FROEBEL UNION (a separate examining body) is Norwich House, Southampton Street, London, W.C.

G

GAELIC LEAGUE ("CONNRADH NA GAEDHILGE"): Founded in 1893. Object: The preservation of Irish as the national language of Ireland, and the extension of its use. The League comprises about eight hundred branches, with an average membership of seventy. Official organ, *An Claidheamh Soluis*, weekly, 1*d*. President, Douglas Hyde, LL.D. *Secretary:* Mr. Padraig O'Dalaigh, 25, Rutland Square, Dublin.

GAMBLING: Repressive legislation has made a serious effort to cope with the social evils attendant upon betting in streets and public places, which previous to the Act of 1906 prevailed on a widely extensive scale. On December 21st, 1906, an "Act for the Suppression of Betting in Streets and other Public Places" was passed, whereby it was enacted that

> Any person frequenting or loitering in streets or public places, on behalf either of himself or of any other person, for the purpose of bookmaking, or betting, or wagering, or agreeing to bet or wager, or paying or receiving or settling bets, shall in the case of a first offence be liable, on conviction under the Summary Jurisdiction Acts, to a fine not exceeding ten pounds; in the case of a second offence be liable, on conviction under the Summary Jurisdiction Acts, to a fine not exceeding twenty pounds; and in the case of a third or subsequent offence, or in any case where it is proved that the person whilst committing the offence had any betting transaction with a person under the age of sixteen years, be liable on conviction on indictment to a fine not exceeding fifty pounds or to imprisonment, with or without hard labour, for a term not exceeding six months without the option of a fine, or on conviction under the Summary Jurisdiction Acts to a fine not exceeding thirty pounds or to imprisonment, with or without hard labour, for a term not exceeding three months, without the option of a fine.

Among the many pressing problems considered at the Pan-Anglican Congress held in London in June, 1908, were a number dealing with the various phases of the gambling evil. According to statistics compiled by the National Anti-Gambling League, the wage-earners of Great Britain risk every year £5,000,000 in betting and gambling, while in 5½ years there were eighty suicides, 321 embezzlements, and 191 bankruptcies traceable to betting. It has been estimated further that there are twenty thousand bookmakers who turn over, between them, £50,000,000 a year.

Betting and gambling among working women and girls was dealt with in a paper by Miss Augusta Deane, who thus describes the commoner forms: "The most usual form in the north country districts would seem to be 'putting something on a horse.' In the midlands there is also much betting on the results of football matches; this, too, is not unknown in some of the bigger west country towns. A very popular form of betting is the sweepstake, and perhaps the most pernicious the lottery or raffle. Money clubs exist in many places, kept, as a rule, by a woman, who is paid something a week to manage it, and then once a fortnight or once a month there is a great 'drawing,' and the prize-winner gets a fixed sum—perhaps £1—and the manager of the club keeps what is over. It is evident that they bet on the results of games of dominoes, and also on wrestling and walking matches when the contending parties are well-known local men. Cards are almost unknown amongst factory and mill hands, but among shop assistants and domestic servants 'playing cards for points' at their clubs and 'below stairs' is the most common form of gambling, and in big houses where there are stables it is often found that the maids are tempted by the outdoor servants to bet on a hunt steeplechase, or on a favourite horse. It has been proved that often the women who go from door to door selling things give betting papers to, or receive them from, maid-servants. Shops in some big towns have been discovered issuing what are practically 'raffle' tickets, through girls they employ, people paying so much with the chance of getting a blanket or something of that sort if their ticket turns out 'a lucky number.'"

Female Gamblers

In a paper on "The Stock Exchange and Gambling," also read before the Pan-Anglican Congress, the facilities afforded by the Stock Exchange in this connection were dealt with under the various methods of transacting business, these being described in the necessary detail to show the gradation from speculation into what is gambling pure and simple. The practice of selling stocks not in the vendor's possession at the time of sale is shown to be a system open to much abuse, "gambling in differences" and "speculating for a rise or a fall" being described as "practices which may tempt those who indulge in them to become in a way freebooters who set to work to depreciate or appreciate the stocks which they profess to sell or buy." Another form of dealing which lays itself open to the encouragement of the gambling spirit is to be found in the transactions of what are known as "bucket shops" or outside stockbroking firms. These are entirely independent of the Stock Exchange and irresponsible, and their advertisements—a feature of trading absolutely prohibited by the Stock Exchange—tend to the promotion of gambling in stocks and shares. In short, bucket shops are briefly described as very often offices kept for betting on the price of securities. Options also lend themselves to abuse. By this method of dealing the operator purchases the right to buy or sell, as the case may be, so much stock on a certain day at a certain price. The question of validity has been dealt with in the courts and depends on the circumstances of each particular case. The carrying over or continuation of a transaction beyond the ordinary settlement, which takes place twice a month, is also in many cases more or less in the nature of a gamble, while the majority of transactions in "differences" and under the cover system are mere bets on the market price of property on a future day. It is added, however, that there are many rules which are for the express purpose of putting a stop to various methods of gambling, and every member of the Stock Exchange has annually to sign a declaration that he will conform to the rules of the committee. It is very exceptional to hear of these rules being broken. (See also GAMBLING, page 530.)

Stock Exchange Gambling

GOLDEN AGE, THE ORDER OF THE: Founded in 1895. Object: To challenge the carnivorous habit as a transgression against physical and moral law, and the chief stumbling-block to the world's progress towards happiness, humaneness, and spirituality. Official organ, *The Herald of the Golden Age*, quarterly, 3*d*. President, Mr. Sidney H. Beard, Paignton, Devon.

GOOD TEMPLARS, GRAND LODGE OF IRELAND: Founded in 1871. Membership eight thousand adults, and 2,700 juveniles. Official organ, *The Irish Templar*, monthly, 1*d*. President, Mr. Robert Marshall. *Secretary:* Mr. James Haveron, City Chambers, Royal Avenue, Belfast.

GOOD TEMPLARS, GRAND LODGE OF SCOTLAND: Founded in 1870. Object: To procure the absolute Prohibition of the liquor traffic. Number of district lodges, forty-eight; adult lodges, 772; juvenile lodges, 489; adult members, 46,468; juveniles, 46,073. Official organ, *The Good Templar*, monthly, 1*d*. Grand Chief Templar, Coun. John Neilson, J.P. *Secretary:* Mr. Tom Honeyman, 204, St. Vincent Street, Glasgow.

GOOD TEMPLARS, THE INTERNATIONAL ORDER OF: This order in 1908 had 8924 adult lodges, with a membership of 420,000, and 3487 junior branches with 240,000 members—a total of 12,411 lodges and 660,000 members. This was an increase of 44,000 members since the preceding triennial report. The International Chief Templar is Mr. Eduard Wavrinsky, M.P., Stockholm, Sweden; and the heads of departments are: International Superintendent of Juvenile Work, Mr. J. W. Hopkins, Gloucester, England; International Electoral Superintendent, Mr. Guy Hayler, Bulmer, Yorks, England; International Treasurer, Mr. Herman Blume, Hamburg, Germany; *International Secretary:* Mr. Tom Honeyman, 160, Hill Street, Glasgow. (See also page 556.)

GORE, RT. REV. CHARLES: Bishop of Birmingham since 1905; born 1853. Educated at Harrow and Balliol College, Oxford (Scholar). Chaplain in Ordinary to the King, 1901. Appointed Bishop of Worcester in 1902. A leading social reformer, whose sermons are largely devoted to a consideration of sociological problems; a worker on behalf of the poor, whose misery has drawn his active sympathies; and a strong opponent of sweating in every form. His belief is that "the law should be so amended as to endow a Church with the right of progress, though, at the same time, a community must be secured against passing waves of feeling." His attitude on the subject of the relations obtaining between the clergy and people is expressed in a public speech on "The Church and Wealth," wherein he asserted that the clergyman was not in touch with the mass of the people, because they were the Church of the rich and not of the poor, of capital rather than labour. It was quite rare, he said, to find an artisan and his wife really at home among the clergy. Further, the Church must get rid of the administration of poor relief, and must ensure the representation of the working classes. In his *Social Doctrine of the Sermon on the Mount*, Dr. Gore says: "The disastrous identification of Church and State, which has allowed the Church to lose its free legislative functions within its own sphere, has altogether obscured, among ordinary Church-people, the sense that there is a social law binding upon their consciences—as in matters of matrimony or of commercial dealings—which is distinct from, and which goes beyond, the law of the State."

Address: Bishop's Croft, Birmingham.

GUILD OF HELP, BRADFORD CITY: Objects: To unite citizens of all classes, irrespective of political or religious opinion (*a*) To provide a friend for all in need of help and advice; (*b*) To secure a timely aid for the suffering and needy; (*c*) To bring about lasting improvement in the condition of each case, by patient study and wise methods of help; (*d*) To prevent overlapping and charitable waste. There are four hundred active workers, supplementing by personal and individual attention the work of the Guardians, the Health and Education Committees; acting as a clearing house and registry of charity, etc. Official organ, *Help*, monthly, 1*d*. President, The Lord Mayor. *Secretary:* Mr. Walter Milledge, City Chambers, Darley Street, Bradford.

The Bradford movement has now spread to between thirty and forty other towns, numbering more than four thousand workers.

H

HERVÉ, GUSTAVE. — This ex-professor of History has become one of the most prominent men in France, as leader of a movement that has threatened to create a new line of cleavage in the Socialist camp. His earnestness and sincerity are acknowledged, moreover he is considered logical, and France is the natural birthplace for such a propaganda as Hervé has started. M. Hervé was first borne to Paris on a national wave of execration. He had chanced to remark in the local journal at Auxerre that the French flag rose from dirt, and he became at once the target of the entire press. Inevitably, as a man of mark, he sought the wider field of Paris. There he rose with extraordinary rapidity in the estimation of his socialistic comrades, being elected a member of the highest councils. Socialism with him has come to mean the repudiation of every national feeling, and M. Hervé has succeeded in raising his programme to the first place among the French problems of the day.

HIGHWAYS PROTECTION LEAGUE: Founded in 1904. Object: The amendment of the law relating to motor vehicles, and its stricter enforcement as urgently needed in the public interest. The League and its associated Road Union call attention to the fact that at the end of February, 1908, the number of motor vehicles registered in Great Britain and Ireland was 28,915, of which 18,952 were motor cars, 1822 heavy motor cars, and 8141 motor cycles. The number of driving licences was 71,943, and the total number of motor cars in the kingdom is estimated to be over 125,000. The reported cases in the first three months of 1908 were 199 accidents: 42 persons killed; 145 injured; 403 motorists summoned, and 365 convicted. *Secretary:* Mr. L. H. Barnes, 17, Figtree Court, Temple, London, E.C.

HOME-READING UNION, NATIONAL: Founded in 1899. Object: For the purpose of guiding readers in the choice of books and of directing self-education. President, H.R.H. Princess Louise, Duchess of Argyll. *Secretary:* Miss A. M. Read, 12, York Buildings, Adelphi, London, W.C.

HOME WORK: (See under SWEATING and WOMAN WORKER.)

HOME WORKERS' AID ASSOCIATION: Founded in 1901. Object: To improve the conditions under which the London home workers live and labour, and to endeavour, by every possible means, to bring back to them the Day of Rest. There are now about one thousand members paying one penny per week. Official organ, *The London Home Worker*, monthly, 1*d*. President, Prebendary H. Russell Wakefield. *Honorary*

Manager: Mr. Thomas Holmes, 12, Bedford Road, South Tottenham, London, N.

HOUSING AND TOWN PLANNING: Miss Annette Churton writes in *Progress*, July, 1908: "The question of the housing of the working classes in London and other large towns has now occupied public attention for many years, and efforts, both private and municipal, have been made to meet the demand of an enormously increased urban population. This increase, as is well known, has been largely augmented by the migration of the villagers into the towns. While admitting that the towns need the reviving influence of a certain amount of fresh country life to counteract the enervating effect of the town, the numbers have vastly increased during the last thirty years. During the ten years alone between 1891 and 1901 no less than 500,654 persons left the country villages for the towns, at the rate, that is, of fifty thousand annually. The effect of this upon the towns is to complicate the problems already existing there, overcrowding and consumption, with which is connected the drink problem, want of work, casual employment, and poverty.

"It is at last being recognized that the root of the difficulty lies in the country. If, therefore, we are to do more than palliate the evil, we must look beyond the town and study the conditions existing in villages. Here we find the most vigorous and enterprising of the young labourers leaving for the towns. The only way out of the difficulty would seem to be to retain the agricultural labourer on the land, and this can only be done by making the conditions such that it will be worth his while to remain. A man of the upper and middle class has often not completed his education at the age when the young farm labourer is earning as much as he can ever hope to earn, and has no further 'rise in life' to expect.

Rural Housing

"Next to the wages difficulty is the housing difficulty. In spite of a diminished country population, there exists in many districts a considerable scarcity of cottage accommodation, leading to such overcrowding as to render a decent healthy life almost an impossibility. Besides the difficulty of overcrowding, the shortage of cottages leads to the continuance in occupation of cottages unfit for human habitation, the sanitary authorities frequently considering that to condemn them would only increase the overcrowding.

"A suggestion has been made by the editor of the *Rural World* that the difficulty of the prevailing merely nominal rent paid for cottages might be met by means of the following readjustment: The labourer should rent his cottage direct from the owner at a commercial rent. The farmer should pay to the labourer the extra wage to allow of this, the owner deducting the same amount from the rent of the farm. In this way, though the owner would receive less rent from his farm, the equivalent would be paid by the cottagers."

As a result of the debate in the House of Commons on the occasion of the second reading of the Rural Housing Bill, in April, 1906, a Select Committee was appointed to consider and report on the evidence of witnesses from different parts of the country. Among others, Miss Constance Cochrane, of the Rural Housing and Sanitation Association (*q.v.*), gave a large number of facts in proof of the following statements:—

(1) That many labourers would like to remain in the country if they could obtain cottages and work. (2) That the land is insufficiently cultivated in most districts. (3) That, generally speaking, the conditions of housing, sanitation, and water supply in country villages are unsatisfactory. (4) That drastic reform is necessary in the administration of the Health and Housing Acts.

The following is a summary of the chief remedies suggested by the Rural Association: (1) Amendment and Codification of the Public Health Acts. (2) A Health and Housing Department to be constituted at the Local Government Board. (3) Improvement in qualification and position of Medical Officers of Health and Inspectors of Nuisances. (4) Local Government Board to have power to enforce the carrying out of the Public Health Acts by Local Authorities. (5) "Any individual" to have power of complaint, as in the Public Health (London) Act, 1891, and the Public Health (Scotland) Act, 1897. (6) Larger administrative areas. (7) Small Holdings and large gardens.

Miss Cochrane also sent in the following tabulated statement, based on her own inquiries and the reports of trusted correspondents:—

County.	Number of villages visited.	One bedroom.	Two bedrooms.	Three or more bedrooms.
Bedfordshire ..	One	5	25	9
Cambridgeshire	Five	67	111	56
Cornwall ..	One	32	70	28
Dorsetshire ..	One	—	14	37
Essex	One	13	94	19
Hertfordshire ..	Two	11	120	156
Kent	Two	20	170	48
Lancashire ..	Two	4	69	72
Leicestershire ..	Three	75	273	69
Norfolk ..	Five	124	257	73
Northumberland	One	8	10	6
Oxfordshire ..	One	2	32	—
Shropshire	Ten, including hamlets	38	141	89
Warwickshire ..	Four	14	81	46
Westmorland ..	One	8	9	6
Wiltshire ..	Three	41	321	33
Yorkshire ..	One	2	55	12
	44	464	1852	759

Many of the above, tabulated as having two bedrooms, have in reality one and a landing.

Information has been obtained from thirty-four other villages in different counties, but it is not sufficiently definite for tabulation. It may be concluded, however, from this that most of the cottages have only two bedrooms, and that the second bedroom is often not more than a landing.

After deliberating for three months on the evidence placed before them, the Select Committee, which included members of the different political parties, issued recommendations, of which the following is a summary: (1) Transfer the administration of the Public Health and Housing of the Working Classes Act from the rural district councils to the county councils, retaining to the rural district councils the concurrent power to build under Part III. of the Housing of the Working Classes Act, 1890, subject to confirmation by the Local Government Board. (2) Statutory duty of county councils to appoint a medical officer or medical officers of health and a sufficient number of sanitary inspectors for the purpose of carrying the statutes into execution. Proper qualifications as prescribed from time to time by the Local Government Board to be insisted upon. Officers to devote the whole of their time to the duties of their office, to hold their appointments during good behaviour and to be removable only with the consent of the Local Government Board. The Local Government Board to issue a more specific memorandum of instructions to medical officers of health and to require compliance with the same. County council to appoint annually a statutory Public Health and Housing Committee.

Suggested Reforms

(3) Register of survey of all buildings intended for human habitation to be compiled and revised periodically. Owners of dwelling-house property to make an annual return of the sanitary condition of every dwelling-house. Penalty for making false return. (4) The sections of the Public Health Act and Housing Act which deal with sanitary defects (Sections 91-96 Public Health Act ; Sections 30-39 Part II. of the Housing of the Working Classes Act) to be widened in their meaning to include not only houses "dangerous or injurious to health," but houses in a bad state of repair or neglect. (5) County council to be empowered, alone or in conjunction with council of adjoining county, to construct impounding reservoirs, etc. (6) County councils to be required to frame bye-laws for every district subject to the approval of the Local Government Board. (7) Local Government Board to register plans and specifications of model cottages. (8) Simplification and codification of the law under the Public Health and Housing Acts. (9) Statutory right of complaint to the Local Government Board of default of county council to be given to every rural district council, parish council, or parish meeting, or to any four householders. Local Government Board to hold inquiry and to make order enforceable by *mandamus*. Or the Local Government Board to be empowered to appoint a person or persons to execute such order, the consequent expense to be recoverable from the county council. (10) Local Government Board to appoint a special Housing and Public Health Department with a staff of travelling sanitary and housing inspectors to supervise the administration of the Public Health and Housing Laws by the county councils and their executive officers. (11) Simplification of the law for acquiring land compulsorily. (12) The Treasury to lend money for the purposes specified in the report at the lowest rate at which the Treasury can themselves borrow. (*a*) To local authorities (county council and rural district council) up to the full amount of the security upon the minimum terms. (*b*) To Public Utility Societies up to seventy-five per cent. of the security upon the minimum terms. Period of redemption of loan to be lengthened. System of increasing the rates of interest in proportion to the length of the period of loan to be abolished. (13) Grants from the Exchequer to be administered by and allocated to county councils at the discretion of the Local Government Board.

The housing problem, in so far as it affects the more populated areas, has often engaged the attention of legislators. In October of 1904 the Rt. Hon. Joseph Chamberlain, in his social programme, raised hopes of some definite action, as follows :—

Town Planning

"We want to clear away these nests of disease and crime which exist in all our large cities, and where people are herded together under conditions which make comfort and health, and even proper living, entirely impossible. . . . What I propose . . . is that the local authorities should have in all cases power to take whatever land they require for the purpose of improvement at a fair price ; that they should be able to combine a great city improvement—the widening of streets and the making of squares, and so on—with sanitary reconstruction ; and in this way the value of the improved property will go to the Corporation, and will go far to compensate for the cost of the sanitary work." But nothing resulted.

The congestion in Metropolitan and provincial city areas may be gathered from statistics quoted by the Rt. Hon. John Burns at the International Housing Conference in August, 1907, that in London one-seventh of the population live at the rate of two to a room, Manchester one in six thus, Glasgow one-half thus.

The Rt. Hon. Alfred Lyttelton recently gave expression to the aspirations of housing reformers—

"The growth of our cities presents the most formidable and the most pressing problem to all those who wish for the welfare of our race. In the first place, it is necessary to have pretty and wholesome dwellings, with gardens and open spaces at hand. In the next place, an orderly and well-designed plan should be evolved for the estate so that each house may be placed with regard to every other house. We wish to bring into being a life in which men shall have understanding of each other, in which the poor shall teach the rich, and in which the rich, let us hope, shall help the poor to help themselves."

On January 25th, 1907, the Rt. Hon. John Burns said—

"He was sure that if all the big towns and cities were only to grasp what they could do under their existing powers, the Local Government Board would be only too pleased to reciprocate. There was no reason why they should not have local expansion, local initiative power for the local authority to develop. In 1908 they hoped to have an opportunity of giving some evidence of their desire to carry out, in a practical way, the objects that had been put before them."

Speaking on the topic a few months prior to the introduction of the Town Planning Bill, Mr. Burns said: "In the last ten years there had been an extraordinary improvement in taste and appetite on the part of the people themselves for better conditions. There was no country in the world where there were so many comfortable homes, no country in which domestic architecture had developed further. But these amenities were possessed too exclusively by a small class. Their ideals were, however, rapidly extending down to the poorest people, and the Government would support it in the strongest possible way. It was the business of those responsible for town government to see that local authorities who were willing should have the means of co-operating with willing private owners to bring about that which has been done by individuals. To carry out what was immediately pressing he, in accordance with promises made by the Prime Minister and himself to a deputation, had before him alternate Bills by which he hoped the desired object would be achieved. Provisions were proposed for the laying out and planning of streets and houses, with conditions to be observed and provisions for arbitration."

Detail's of Bill

The practical outcome of this promise was the Housing, Town Planning, etc., Bill, which Mr. Burns introduced to the House of Commons on March 26th, 1908. It passed its second reading on May 12th, and was sent to the Standing Committee on the same day. Town-planning under this measure may be described as the mapping out by local authorities of their new districts as a whole, instead of allowing them to grow up in a haphazard, piecemeal manner. The municipality would settle the direction and width of new streets, decide on the extent of open spaces, and to some extent define the class of dwellings to be erected, and restrict the number of houses per acre.

This Bill contains sixty-one clauses and six schedules. It (*a*) facilitates the purchase of land by local authorities through a lengthening of the period for repayment of loans ; (*b*) empowers local authorities to inspect dwellings after giving twenty-four hours' notice, to declare houses to be unfit for habitation, to order their demolition, or, alternatively, to undertake repairs and charge the cost to the landlord ; (*c*) empowers local authorities to undertake schemes for town-planning, and, if necessary, to purchase land for the same, or, alternatively, to compensate the landowners affected.

This much-needed reform secured an unopposed reception in the Commons. So general, indeed, was the recognition of the necessity of housing reform that, though the Bill is a strong one and goes much farther than any previous measure, speakers on all sides were so

far from thinking it too strong, that their speeches were mainly devoted to showing that it should be made stronger still. To show how really strong Mr. Burns's Bill is, one point may be mentioned. At present the obligation on a landlord to see that a house is fit for human habitation applies only to cottages of less than eight pounds a year rent. The present Bill doubles this limit in the case of the country, and raises it to forty pounds in London. Besides housing, the Bill also deals with town-planning—for the first time in this country, though much has been done in regard to it abroad. Local authorities are given power to control the development of their districts, and the gain to towns in both health and beauty will be incalculable.

The trend of city workers towards living in purer and less crowded surroundings is shown by the following table covering the last century :—

	Acreage.	Population.		
		1801.	1851.	1901.
City of London and immediately surrounding parishes	1,724	256,000	266,000	100,000
Inner belt surrounding the above	5,237	345,000	711,000	710,000
Outer belt	69,491	357,000	1,394,000	3,750,000
Districts lying outside the County of London	—	—	196,000	2,050,000
Total of Greater London	—	—	2,567,000	6,610,000

To cope with this outward movement, Mr. Burns says : "Rapid means of communication into what was at present better air, and into pleasanter scenes for those who had to work in great towns were introduced, and the very provision of that rapid means of locomotion caused the creation in the country of the very evils (unsuitable dwellings) they were seeking to keep away from. The whole thing wanted to be controlled and regularized, and, of course, the only people in whose hands that power could safely and properly be put were the municipal authorities on the spot."

Rapid Transit

With regard to facilities for dwellers in suburbs of large cities reaching their homes rapidly, the proposal contained in the following opinion from the Rt. Hon. A. J. Balfour is progressive :—

"We have to recognize that London, from its unequalled size, presents difficulties so different in degree from those met with elsewhere that they almost amount to a difference in kind, and I am certain that the improvement of means of communication is the most important element in the problem.

"What I am anxious people should bear in mind is that trams, railways, and 'tubes' by no means exhaust the catalogue of possible improvements in transit. Indeed, I am not sure that they are the means of communication for relatively short distances which some years hence will find most favour. What I should like to see carefully thought out by competent authorities would be a system of radiating thoroughfares, confined to rapid (say, fifteen miles an hour or over) traffic—this is absolutely essential—and with a surface designed not for carts or horses, but for some form of auto-car propulsion. If the local authority which designed and carried out such a system chose to run public auto-cars along them, well and good; but this would not be necessary, and private enterprise would probably in time do all that was wanted. In such thoroughfares there would be none of the road-monopoly inseparable from trams. The number of people carried could be much larger, the speed much greater, the power of taking them from door to door unique, while there would be none of the friction now caused when the owners of the tram lines break up the public streets. It may be urged, and perhaps with truth, that at present the auto-car industry has not devised an absolutely satisfactory vehicle, but we are, I believe, so near it that the delay ought not to be material.

Radiating Causeways

"It is, of course, obvious that the present difficulty of locomotion in our streets is almost entirely due to the want of differentiation in the traffic. We act as the owners of a railway would act if they allowed luggage trains, express trains, and horse-drawn trams to run upon one pair of rails. The radiating causeways, as I conceive them, would be entirely free from this difficulty. Neither the traffic of cross-streets, nor foot passengers, nor slow-going carts and vehicles would be permitted to interfere with the equable running of the fast cars. There would be no danger and no block. No doubt the cost would be great, but the upkeep would be small, and there would be no terminal charges. No great areas would have to be cleared, as in the case of railways, for stations and sidings. The local authority which made the causeway would not be compelled to become managers of great railway enterprises. The rolling-stock would be provided by the public to suit its own needs, and as the causeway would be connected at intervals with the ordinary road and street system of the district, and would melt into that system at either end, every village in which there were enough residents who had to be in London at a fixed hour every day, could have a motor of its own. It might be well worth a manufacturer's while, I should suppose, to lodge his workpeople out of London, and to run them to and from his works. This scheme may be open to practical objections of which I am not aware ; but if it be true that improved locomotion is the real key of the housing difficulty, then I submit that this form of providing it would probably prove to be the cheapest, the easiest, and the most convenient."

A Growing Movement

The movement for better houses and rural environment is growing with rapidity. At Birmingham, Manchester, Warrington, Birkenhead, and Leeds "Garden Cities" are either progressing or planned, and at Hampstead a venture, though not precisely on the same lines, was launched in 1907 for the erection of houses on proper hygienic principles, each with an expanse of land surrounding, the average being eight houses per acre.

Thus there are several practical examples now in operation of success in town-planning, for particulars of which see GARDEN CITY MOVEMENT (532), HOUSING IN GREAT BRITAIN (583), MODEL VILLAGES (772), etc.

I

ICA, THE: The founding of colonies for Jews by the Jewish Colonisation Association in South America, and elsewhere, known as the Ica, is given on page 660. A detailed report was published in August, 1908, reporting the progress and position to the end of 1907, of the various sections of undertakings comprehended in the Ica. During the year 1238 new colonists had come into the various colonies in the Argentine, making the total persons 13,212. The harvest operations for the year realized £373,666. The report indicates that the material

situation of the colonists has ameliorated. Not only does each perfect his implements and improve his flocks and herds, but the well-being of the family and the housing accommodation are also gradually increasing. At the same time the colonists are paying off their liabilities to the Association; in all, £64,846 were repaid during the year, and, in addition, £21,603 were also refunded on account of special loans. In 1907, the remittances through the medium of the Association to relatives amounted to £12,912.

At the end of the year there were in the Argentine Colonies thirty-one schools, served by seventy-five teachers and attended by 2009 pupils (1095 boys and 914 girls). The schools continue to receive Government grants, and are frequently visited by Government inspectors.

The general position at the end of 1907 of the Argentine colonies is seen by the following tables:—

POPULATION.

	Colonists.		Immigrants.		Total.	
	Number of families.	Number of persons.	Number of families.	Number of persons.	Families.	Persons.
Moïsesville ..	467	2,642	88	645	555	3,287

	30,978	85,401	25,870	142,249

In Brazil, the Philippson colony, at the end of 1907, consisted of forty-two families of colonists, numbering 272 individuals, and 169 labourers, ninety-seven males and seventy-two females, the latter working in the fields with the same activity as men. The estate in Rio Grande covers a total area of 5,399 hectares, 2,610 of which were colonized at the end of the year. (One hectare = two acres, one rood, thirty-five perches.)

In Canada, Cyprus, Palestine, Russia, and elsewhere, Ica settlements have been established.

That in Palestine shows promise of development, though the economic conditions of many of the colonists, as reported at the end of 1907, were "far from being on a solid basis."

The "former Rothschild" colonies are Rishon le Zion (844 inhabitants), Maskereth Bathya (353); Petach Tikvah (1,207); Zichron Jacob (870); Mesha (137); Melhamieh (110); Yamma (222); Bedjen (41); Rosh Pinah (565); Yessod Hamaleh (224); and Metouleh (282).

The Association colonies comprise Waad-el-Hanine (130 inhabitants); Katra (109); Rehoboth (506); Hédérah (164); Mishmar Hayardan (105); Sedjera (27 farmers). (See also ITO, ZIONISM, AND JEWISH COLONIES.)

IDO: This new "universal language" is based upon the main principles of Esperanto, but by its advocates is claimed in its essentials to be easier to learn and more methodical. The chief facts concerning its adoption by the Delegation for the Adoption of an Auxiliary International Language are contained in a prospectus issued by that body in 1908. It states that in 1907, an International Committee of scientists and linguists was elected, who, after examining all past and present schemes for an international language, adopted Esperanto with a few alterations, so calculated as to preserve the principles and essential qualities of the language invented by Dr. Zamenhof, while applying those principles more consistently and doing away with what they allege are unnecessary complications.

The *Secretaries* of the Permanent Commission are MM. L. Couturat, Lit. D., and L. Leau, D.Sc. British address: c/o Mr. Guilbert Pitman, 85, Fleet Street, London, E.C.

See ESPERANTO and LANGUAGES.

ILLICIT COMMISSIONS: The widespread custom of recognizing the goodwill of a servant or employé by monetary gifts received a check by the "Prevention of Corruption Act," which came into force in January, 1907, and provides that—

"If any agent corruptly accepts or obtains, or agrees to accept or attempts to obtain, from any person, for himself or for any other person, any gift or consideration as an inducement or reward for doing or forbearing to do, any act in relation to his principal's affairs or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs or business; or if any person corruptly gives or agrees to give or offers any gift or consideration to any agent as an inducement or reward for so doing or forbearing so to do; or if any person knowingly gives to any agent, or if any agent knowingly uses with intent to deceive his principal, any receipt, account, or other document in respect of which the principal is interested, and which contains any statement which is false or erroneous or defective in any material particular, and which to his knowledge is intended to mislead the principal, he shall be guilty of a misdemeanour, and shall be liable on conviction on indictment to imprisonment, with or without hard labour, for a term not exceeding two years, or to a fine not exceeding five hundred pounds, or to both such imprisonment and such fine, or on summary conviction to imprisonment, with or without hard labour, for a term not exceeding four months, or to a fine not exceeding fifty pounds, or to both such imprisonment and such fine.

"A person serving under the Crown or under any corporation or any municipal, borough, county, or district council, or any board of guardians, is an agent within the meaning of this Act."

A Christmas box to a postman does not come within

the scope of the Act. A league to prevent the Act from becoming a dead letter has been formed, with Sir Edward Fry as President, and, as *Secretary*, Mr. R. M. Leonard, 3, Oxford Court, Cannon Street, London, E.C.

Municipal Bribery

Analogous to this subject are the prosecutions of certain Poor Law Guardians and officials, notably at Poplar, London (1907 and also 1908), Mile End, London (1908), for bribery and illicit commissions in connection with contracts and supplies. There were ten accused in the Mile End case, and after a twenty days' hearing at the Central Criminal Court the whole were found guilty. Sentences varying from two years' imprisonment with £250 fine to six months' imprisonment with £25 fine were imposed. Throughout the country, resulting upon the stringent action of the Local Government Board, under the Rt. Hon. John Burns, M.P., there has been much voluntary inquiry by local authorities. The general question of corruption is dealt with on page 316.

REFERENCE: *Poplar Guardians—Report of Commission.*

IMPERIALISM: The British Empire occupies approximately twenty-one per cent. of the earth's surface, and its population is in the proportion to the world of twenty-two per cent. The total area of the British Empire is nearly 11,400,000 square miles, with a total population of about 410,000,000. The known surface of the globe is estimated at 55,000,000 square miles, and its total population is believed to be about 1,800,000,000. The total revenue exceeds £400,000,000, the debt totals over £1,500,000,000, and the trade exceeds £1,600,000,000.

Units of Empire, 1908.	Estimated population.	Area in square miles.
United Kingdom of Great Britain and Ireland	44,100,000	121,000
Commonwealth of Australia, etc.	4,100,000	3,100,000
Dominion of New Zealand	900,000	105,000
Dominion of Canada, Newfoundland, etc.	5,600,000	3,750,000
West India Islands, South America, Falkland Islands	1,502,000	130,000
Antarctic, South Georgia	—	1,500
Gibraltar, Malta, and Cyprus	3,721	450,000
Empire of India and its dependencies	1,900,000	300,000,000
Ceylon and Maldives	26 000	4,000,000
Eastern Asia	2,000	1,000,000
Africa, South	1,238,000	6,300,000
West	600,000	33,000,000
East and Central	750,000	8,000,000
Mauritius, Seychelles, etc.	900	400,000

Fuller and earlier tables appear on pages 130–131.

The Prince of Wales

The Prince of Wales delivered a memorable speech on "Britain beyond the Seas" in May, 1908, at the annual festival of the Royal Colonial Institute, in which he said—

"During the time that has elapsed since I first went to sea, in 1879, I have been able to visit almost every part of our Empire. I am indeed deeply sensible of my good fortune, and without boasting, I may claim that probably no one in this room has landed on so many different portions of the British soil as I have. Under the circumstances, it would be strange indeed if I did not take a deep and continuing interest in the progress and welfare of those Dominions beyond the seas.

"By England we do not mean these islands in the Western sea, but an England which is spread over the whole surface of the world.

"One of our first objects should be to develop the true spirit of Empire, and to strengthen those links of kinship which will bind for ever the vast and varied portions of the over-sea dominions with the Mother Country. We must not lose sight of our common interests, aims, and objects, in the fulfilment of which there must be mutual efforts, mutual self-sacrifice.

"Does such co-operation as we would desire really and fully exist? Undoubtedly there has been a great improvement in this direction. But still, is there not much to be accomplished by strengthening our social relations—by the Mother Country making it clear to her children that they are always certain of finding here a home, not in name only, but in reality, and the same warmhearted hospitality as is always extended to us in every portion of the globe where the British flag flies? I have endeavoured to touch lightly on the vital necessity for reciprocal action between those at home and our brethren beyond the seas. We must foster, now and always, the strongest feelings of mutual confidence and respect. By methods of education, by unity of action in everything that leads towards the noblest ideals of civilization, by utilizing the great powers of science, and by means of defence by sea and land, we must strive to maintain all that we esteem most dear. If we hold hands across the seas we shall preserve for future generations a noble heritage, founded upon the highest patriotism and knit together by the ties of race and of mutual sympathy and regard."

Lord Curzon

Another speech on the subject of Imperialism which created considerable interest was one given in Birmingham on December 11th, 1907, by Lord Curzon of Kedleston. In entitling his address "True Imperialism" he did not suggest that there was a false Imperialism. "There can be no false Imperialism," he said, "if the proper meaning of the conception as the faith of Empire be borne in mind. I speak of Empire because I am a convinced and unconquerable Imperialist. It had been too much the fashion to represent that the Empire had been built up by a succession of wicked and unscrupulous men, that Empire-makers, as a rule, were commandment-breakers, and pro-consuls—a class to which, fortunately or unfortunately, he belonged—represent in general a particularly dangerous type.

"But, in the list of the men who have made the British Empire we find that moral virtues, a spirit of humanity, and an almost puritanical fervour have been more common qualities than those of the filibuster. Equally untrue was it that the British Empire was acquired in a fit of absence of mind. It had been the work of time and of many minds. He would describe the Empire, therefore, as the result, not of an accident or a series of accidents, but of an instinct—that ineradicable and divinely implanted impulse, which has sent the Englishman forth into the uttermost parts of the earth, and made him there the parent of new societies and the architect of unpremeditated creations.

"As a result of three centuries of such effort, we have the British Empire as it now exists. It is the largest Empire that now exists or that ever has existed. It is unique in character and organization. Two features we may at once notice. Wherever this Empire has extended its borders, there misery and oppression, anarchy and destitution, superstition and bigotry, have tended to disappear, and have been replaced by peace, justice, prosperity, humanity, and freedom of thought, speech, and action, and, what is unique in the history of empires, by a passion of loyalty and enthusiasm.

"These islands are the heart and core of the Empire. But what would England be without the Empire? Suppose India and the Colonies gone; then your ports and coaling-stations, your fortresses and dockyards, your Crown Colonies and Protectorates will go too; and England from having been the arbiter will sink at best into the inglorious playground of the world.

"No generalization could be more historically inexact than to say that Great Britain has been urged into an Imperial career by national vanity or territorial greed.

If our Empire has advanced by leaps and bounds, it has commonly been in spite of our government and statesmen. The parings of our Empire, areas once held and afterwards surrendered, would make a respectable Empire. South Africa fell in to us against our will. Lord Salisbury, himself an Imperialist, strove his hardest to extricate us from Egypt. We have thrice conquered and thrice evacuated Afghanistan.

Ebb and Flow

"Any false image of Imperialism is one against which we should be on our guard—our conception must not rest on a merely material basis. The maxim that trade follows the flag suggests the planting of the flag in order that it may be followed by trade. In my view the reverse is much more historically correct, namely, that the flag follows the trade. I believe strong Imperialistic sentiments are shared by the great majority of the working classes of the Empire. The late Mr. Richard Seddon, who declared himself an arch-Socialist, was one of the most ardent Imperialists. If the Empire of the future is to continue, it must rest upon a democratic basis and must satisfy democratic ideals. Imperialism must give us a policy.

"The Empire is still only in a fluid and transitional formation; it has yet to be welded into a great world-state. The constituents are there, the spirit is there; but the problems are still unsolved and the plan has yet to be produced. In the economy of the Imperial household we are dealing not with children, but with grown men. That they are bound to us by sentiment is a priceless asset; to throw it away would be a criminal blunder. Empire can only be achieved with satisfaction and maintained with advantage, if it have a moral basis. To the people of the Mother State it must be a discipline, an inspiration and a faith. To the people of the circumference it must be more than a flag or a name; it must give them not merely justice and order, or material prosperity, but partnership in a great idea. In our national character, if we can keep it high and undefiled, still lies our national strength."

IMPORTS, BRITISH: (See under TRADE RETURNS.)

INCOME TAX: The budget for 1907–8, introduced in the House of Commons by the Chancellor of the Exchequer on April 18th, 1907, made an important change in the incidence of taxation by differentiating, in the matter of income-tax, as between earned and unearned incomes that do not exceed £2000, the tax imposed being at the rates of 9*d.* and 1*s.* in the pound respectively. An income not exceeding £160 is exempt; other exemptions allowed are £160 on incomes below £400, £150 on those below £500, £120 when under £600, and seventy pounds below £700. In 1906–7 income-tax yielded £31,600,000. Income-tax was made the subject of special consideration by a Select Committee of the House of Commons, appointed on May 4th, 1906. Its report was issued on November 29th following. The Committee, after discussing the modes in which graduation could be applied, approved of the principle of the "super-tax," that is, "a second income-tax, distinct from and supplementary to the existing tax, to be levied on individuals by direct personal assessment."

This proposal required that a full statement of individual net income should be obtained from all persons upon whom the super-tax would be levied. The report also discussed the method of graduation by "digression" on the lines of the present system of abatements and approved of the principle. The Committee's conclusions may be briefly summarized as follows: (1) Graduation of the income-tax by an extension of the existing system of abatements is practicable; (2) Graduation by a super-tax is practicable; (3) Abandonment of the system of "collection at the source" and adoption of the principle of direct personal assessment of the whole of each person's income would be practicable; (4) Differentiation between earned and unearned incomes is practicable; (5) A compulsory personal declaration from each individual of total net income in respect of which tax is payable is expedient and would do much to prevent evasion and avoidance of income-tax payments.

"Earned income" is defined as "any remuneration from any office or employment of profit held by the individual, including any pension, superannuation allowance, or deferred pay in respect of past services in that office or employment."

Under the reduced charge from 1*s.* to 9*d.* in the pound on all earned incomes not exceeding £2000, the amounts actually paid in the pound are estimated as follows:—

(1) The average rate is only 9½*d.*

(2) Not more than one-fifth of the total number of income-tax payers pay 1*s.*

(3) Of the remaining four-fifths, the majority pay 8*d.*, while many pay much less.

In a speech on July 25th, 1908, the Chancellor of the Exchequer (the Rt. Hon. D. Lloyd-George) pointed out that the amount of income in the country on which income-tax might be levied had increased during the last ten years by no less than 220 millions a year, while during the same period taxation had increased by some twenty or thirty millions, or only one-tenth of the 220 millions.

The question of the basis upon which income tax should be imposed in France, has been the subject of prolonged discussion by the Chamber of Deputies, and many amendments have been made to the original scheme introduced by the French Government in February of 1907, but the Bill has not yet been finally passed. Its provisions have given rise to considerable agitation throughout the country, particularly on the difficult question of the administrative control, and declarations made by the taxpayers, a point upon which a compromise was effected in the beginning of July, 1908. The matter was discussed by a special committee on legislation, and the Government agreed to the compromise mentioned, of which the following was the text:—

France

"If the Controller accepts the declaration as true, it is taken as the basis of the tax. If he regards the declaration as inaccurate, he invites the taxpayer to alter it within twenty days. If after the lapse of that period it has been impossible to come to an agreement, the Controller makes an official valuation. That estimate and the declaration are submitted to the procedure provided for in clause 4. The Controller justifies his estimate before the administrative tribunals with the help of information resulting from all Acts, judgments, declarations, administrative documents, and notes, or proofs and titles of any kind legally in the cognizance of any of the State administrations. The taxpayer may contest the estimate of the Administration by the use of any documents which he may consider conclusive. In no case, even if expert evidence is ordered, can the Court demand the production of accounts. The tax is doubled, but only on the dissimulated portion of the revenue, in the case of the taxpayer who has made a declaration below the facts. . . . If there is no declaration, the Controller proceeds to a regular estimate, which he presents to the taxpayer who has twenty days in which to present his observations. . . ."

In the revenue returns for 1908, the tax on income for personality was estimated to produce 91,394,000 francs, as against 85,839,500 francs for 1907.

An outline of the Government proposals is given on page 601.

INDEPENDENT LABOUR PARTY: In addition to the details given on page 603, it may be added that in September, 1908, there were roughly nine hundred branches on the register, a net increase of

about 350 branches within the fiscal year, more than have been established in any like preceding time. The membership then stood at fifty thousand. Assets of the party at February, 1908, were £3762, and the cash at call in case of emergency £1989; the total sales of literature amounted to £4663, and the *Socialist Review*, a new monthly, appeared on March 1st, 1908. The party now has fifty-six branches, in and around London, federated into five councils, and during the last year the movement was established in Ireland, with five branches in the Belfast district, and one in Dublin.

INDIAN SEDITION: Serious disorders in India led the authorities, in 1908, to adopt strong measures for suppression of a movement, which from the partition of Bengal into two provinces in September, 1905, had developed alarming proportions. The discontent was most marked among the Bengali Hindus, especially among the educated class, or the Babus.

On June 8th, 1908, the Legislative Council passed two Bills by which it was hoped to restore order and give protection to the civil and military servants of the Government. The Explosives Act was designed to prevent the manufacture and use of explosive machines, and the concealment of substances intended for that purpose; while the Press Act was intended to stop inflammatory utterances in the native journals. The partition, or more properly the reconstitution, of Bengal had been followed by an anti-British or Swadeshi movement as it was termed, which from a boycott of British goods that, however, proved ineffective, eventually became a campaign of disorder and lawlessness which occasioned the Indian Government considerable trouble. In 1906, Sir Bampfylde Fuller, Lieutenant-Governor of the Province, decided to take measures to enforce proper discipline and order in the Hindu schools of Eastern Bengal, which had become hotbeds of sedition and mischief. His proposals, however, failed to obtain the support of the Indian Government, and shortly afterwards he resigned. The condition of affairs then began to assume a dangerous character so far as the safety of European residents was concerned. In the Punjaub particularly riots and attacks on missions and white men took place, which were only checked for the moment by the deportation of two notorious political offenders.

The Three Movements

There were in reality three distinct movements in progress. (1) The "Swadeshi movement," which nominally sought to encourage Indian manufactures by forbidding the use of British imported goods, but which was rather aimed at the Mohammedan merchants and shopkeepers, the special objects of Hindu detestation, who happened to hold large stocks of British wares; (2) The "Swaraj movement," which demanded Home Rule for India; (3) The "National Volunteer" movement, which consisted in the organization and training of semi-military bodies of Babus and Hindus. They drilled with sticks and bows and arrows, and pervaded the provinces of Bengal and Eastern Bengal.

About the end of 1907, the native newspapers daily published incitements to natives to attack Europeans. Bomb outrages became frequent; the Viceroy's motor-car was stoned, and an attempt made to blow up a train in which the Lieutenant-Governor of Bengal, Sir A. H. Leith Fraser, was travelling. Finally a bomb factory and a college for giving instruction in the art of murder were discovered in a suburb of Calcutta. A large number of persons were arrested, and their admissions and the papers seized afforded proofs of the existence of a widespread conspiracy. Legislative measures to cope with the danger became necessary, and for this purpose the two Bills referred to were introduced and passed by the Legislative Council.

The more important of the two new Acts was that which dealt with incitements in the Press. It provided summary measures for dealing with journals guilty of urging the commitment of murder or other major crimes of violence, without procedure before a court. Should the Government consider that a newspaper has infringed the provisions of the Act, they may instruct the magistrate of senior grade to enforce the law by suppressing the offending publication, closing its office, and confiscating the plant. There are no arrests and no prosecutions entailed. If the owner of the office and plant considers that the Government have acted wrongfully, he may appeal to the High Court, and if the Court holds that the articles complained of do not come within the meaning of the Act, it may reverse the decision of the Government.

The measure dealing with explosives was based upon the provisions of the Explosive Substances Act, passed in England in 1883, which enacted that any person causing a dangerous explosion should be liable to penal servitude for life; conspiring with the object of causing an explosion, or being in possession of explosive substances for that purpose, became offences punishable with twenty years' penal servitude; even the possession of explosive substances under circumstances giving rise to "a reasonable suspicion" that they were not to be used for a lawful purpose, rendered the accused person liable to fourteen years' imprisonment. Moreover, any person who, by the supply of or the solicitation of money, the providing of arms, the supply of materials, or in any manner whatever "procures, counsels, aids, abets, or is accessory to the commission of any crime" under the Act, was declared guilty of felony in the same degree as a principal. That enactment rapidly put an end to the felonious use of dynamite in Great Britain, and its existence upon the Statute-book is still regarded as a valuable deterrent. The necessity for a similar Act in India was amply demonstrated by the outrages that had taken place against the lives and property of Europeans.

Swadeshi Methods

The boycotting methods of the more violent and less influential supporters of the "Swadeshi" movement were soon shown to be of little value in operation. The more intelligent and far-seeing members of the industrial community saw the advantages of the protection and peace guaranteed to commercial enterprise by the British in India, and did not believe in a "Swadeshi" which refused to join hands with foreign experts and foreign capital, much as they desired to see the fruits of India's wealth and industry kept within their own country. This is pointed out by Mr. S. M. Mitra, a member of the Royal Asiatic Society, in his work *Indian Problems*, published in London in February, 1908. He says:—

"There is nothing to be disheartened about in the 'Swadeshi' movement in India. A true 'Swadeshi' enterprise appreciates the expert assistance of the English. There is nothing to trouble about in the false 'Swadeshi.' There is nothing genuine about it. The extreme utterances of the Indian professional agitators represent as much Indian popular feeling as Hyde Park speeches represent the London Chamber of Commerce. The Bengal Boycott is only a political ventriloquism inspired by the irrational opposition to the so-called Partition of Bengal. The native newspapers of India in their editorial columns denounce, but in their advertisement columns give a tremendous impetus to, the sale of English goods. So much for the consistency of the Bengal Boycott. The Anglo-Saxon race is strong in commercial cleverness and resourcefulness. I have no doubt that it will prove strong enough in commercial unity to put down the Bengal Boycott. Not knowing the ABC of economics, the false 'Swadeshi' agitators, in trying to throttle British enterprise in India, are really throttling their own country. The relations between England and India must be those of close co-operation. Commercial England must adapt herself to the new

phase of her commercial position. Commercial contact leads to political unification."

This expression of opinion is practically in a line with Anglo-Indian views generally, in not regarding the agitation as dangerous to British rule. The Mohammedans and the native Princes remain thoroughly loyal and active in the suppression of sedition within the territories over which they exercise control, and the measures adopted by the Government are considered to meet the situation.

On June 6th, 1908, in the House of Commons, Viscount Morley promised inquiry with a view to reform of Indian Government and further participation by the natives in the work of legislation and administration. He outlined certain reform proposals which the Indian Government had evolved for the purpose of democratizing the Government of India :—

"We have given approval to the establishment of an advisory Council of Notables. It would be purely advisory, but would serve the double purpose of eliciting independent opinion and of diffusing, what is most important of all, correct information as to the facts and intentions of his Majesty's Government. The second proposal is the acceptance of the general principle of a substantial enlargement of the Legislative Councils, both the Governor-General's Legislative Council and the Provincial Legislative Councils. Thirdly, in the discussion of the Budget in the Viceroy's Council the subjects are to be grouped and explained severally by the members of the Council in charge, and longer time is to be allowed for this detailed discussion and for general debate. The Secretary of State has the privilege of nominating members of the Council of India. I think that the time has now come when the Secretary of State may safely, wisely, and justly nominate one, and it may be two, Indian members."

Council of Notables

The Council of Notables was to be called the "Imperial Advisory Council," and its sixty members Imperial Councillors. They would comprise twenty ruling chiefs and a number of the territorial magnates of every province. They would hold office for five years. The functions of the Council would not be legislative but advisory, and the proceedings private. A Commission was appointed, of which Mr. C. E. H. Hobhouse, Parliamentary Under-Secretary for India, was chairman, "to inquire into the relations now existing, for financial and administrative purposes, between the Supreme Government and the various Provincial Governments in India, and between the Provincial Governments and the authorities subordinate to them ; and to report whether, by measures of decentralization or otherwise, those relations can be simplified and improved."

The Governor-General's Legislative Council was to be composed of fifty-four members, to include two elected Mohammedans, seven members elected by the nobles and great landowners of Madras, Bombay, etc. ; four non-official members to represent minorities.

The Council of India would in future consist of from ten to fourteen members, with salaries of £1000 ; office to be held for seven years. Two natives—one Hindu and one Mohammedan—had been appointed—Syed Husein Belgrami and Mr. K. G. Gupta.

INDIANS IN THE TRANSVAAL : (See under SOUTH AFRICA.)

INDUSTRIAL INSURANCE (STATE) IN FINLAND : The movement that has for some time been apparent in England, in favour of the better insurance of the working classes, of which Germany was the pioneer, has developed with much greater rapidity in several of the countries upon the Continent. The question has occupied, for instance, the consideration of special committees in Norway, Sweden, Finland, etc. ; and the trend of legislative action in this direction is well shown in the various provisions contained in the Bill drawn up by the Government Committee appointed for that purpose by the Grand Duchy of Finland, the main sections of which comprise the following proposals :—

The object of the Bill is primarily to insure against the consequences of invalidity and old age in the case of all persons over fifteen years of age who work for wages for other people, whether these wages be paid in money or in kind. Officials and employees of the State, of the Commune, of the Churches, and of public institutions are exempted from the duty of insurance, as are also private officials if their annual earnings exceed £100 ; persons who do not regularly work for other persons, if their earnings exceed the above amount ; persons who only get free board and lodging for their work ; persons who under the Bill are considered invalids ; and, lastly, such persons as are not yet insured at the end of their fifty-fifth year. The Bill further stipulates that at their request also other persons than those enumerated above may be freed from the duty of insuring themselves, and it further provides a voluntary insurance for persons having not yet finished their thirty-fifth year, whose income does not exceed £100 per year, and who cannot under the Bill be considered invalids.

A person for whom insurance has been compulsory and who leaves work, shall also be entitled to continue the insurance voluntarily. If by his work an insured person acquires the right to an annual State pension of £25, or if he receives another pension to the same amount, or a State insurance to the same amount, that person shall have to be struck off the lists of the insurance. The same shall hold good for any Finnish subject giving up his citizenship or for any foreigner who leaves Finland. The contributions as well as the pensions have been divided into classes.

	Earnings per week.	Earnings per year.	Contributions per week.
	s. d.	£ s. d.	d.
Class I.	up to 3 11	up to 9 16 10	1½
,, II.	,, ,, 5 10	,, ,, 14 14 1½	2
,, III.	,, ,, 8 7½	,, ,, 21 11 4½	2⅝
,, IV.	,, ,, 13 4	,, ,, 33 6 8	4
,, V.	,, ,, 19 7½	,, ,, 49 — 4½	5⅜
,, VI.	over 19 7½	over 49 — 4½	7½

The agricultural day-labourers shall without consideration of the amount of their wages be reckoned among the second class, and the women employed in agriculture shall be reckoned among the first class. One-half of the contributions for the compulsory insurance shall be paid by the insured persons, the other half by the employers, who shall be entitled to deduct the necessary amount for the contributions of the workers from the wages. If an insured person desires to pay higher contributions, he shall be entitled to do so ; the employer, however, cannot be forced to pay higher contributions. The whole contribution for the voluntary insurance shall be paid by the insured person. In case of invalidity the pension shall either be paid if the invalidity is permanent, or if it lasts for more than four weeks, in case the person asking for the pension has been insured for at least four years, and if at least 150 weekly contributions have been paid for him. The old age pension shall be granted to every person living in Finland, who has finished the sixty-fifth year of age, has been insured for thirty years, and can prove having paid at least 1200 weekly contributions. The pensions shall be composed of two parts, the original amount, and the increase. The original amount shall be £2 10s., the increase to consist of twenty per cent. of the contributions booked for the person receiving the pension. To every invalidity pension paid out the State contributes £2 10s. To every old age pension the State also contributes £2 10s. per year, if the income of the person receiving the pension does not amount to more than £20, apart from the pension, and £1 5s., if the income without the pension does not exceed £30. In further clauses the relation of the persons receiving pensions to the accident insurance is regulated, and also the special conditions regarding foreigners, etc. If an insured person is struck off the lists for one of the reasons mentioned above, such as giving up his citizenship, emigration, or the receipt of a State pension or State insurance of £25, half of the money paid by him in contributions can be claimed back again ; the same shall hold good, if an insured person who has become incapable to earn his living does, under the Act concerning Accident Insurance, resign his claim to the invalidity pension because he receives an accident insurance, or if he is refused an invalidity pension. If an insured person dying before he has received a pension leaves children of less than fifteen years of age, half of the contributions paid by him shall be paid to his family.

INDUSTRIAL LAW COMMITTEE : Founded in 1898. Object : To supply information as to the legal protection of the industrial classes with regard to the conditions of their trade ; to constitute a central body to which may be reported breaches of the law, in order that these may be inquired into, or referred to the proper authorities. Chairman, Mrs. H. J. Tennant. *Secretary* :

Miss Irene Cox, York Mansion, York Street, Westminster, London, S.W.

INEBRIATES' SANATORIA: (See under TEMPERANCE PROBLEMS.)

INEBRIETY, THE SOCIETY FOR THE STUDY OF: Founded in 1884. Objects: The investigation of all forms of alcoholism. Membership, nearly eight hundred; subscription, 5*s.* annually. Official organ, *The British Journal of Inebriety*, quarterly, 1*s.* President, Thomas Claye Shaw, B.A., M.D., F.R.C.P. *Hon. Secretary:* T. N. Kelynack, M.D., M.R.C.P., 133, Harley Street, Cavendish Square, London, W.

INSTITUTIONAL CHURCH: Mention of a few centres only of this important religious movement will suffice to show its scope in the United Kingdom. Opened in the autumn of 1908, and erected specially for Institutional work by the Wesleyans of Sheffield, the Victoria Hall, Norfolk Street, is a fine example of a building specially planned for carrying out in the most effective manner the various organizations comprehended in Institutional work. It cost £41,000. There is also a specially erected Institutional Church at Deptford, a part of London so poor that a "Deptford Fund," under Royal auspices, exists for relieving the chronic poverty of this south-eastern suburb. Here, grouped round the spacious central hall, are many branches of work covering the district and showing decided progress under the Rev. Gregory Mantle. The various older Institutional Churches of the Congregational, the Wesleyan, and the Baptist bodies are referred to on page 509, and the Settlements on pages 1107 and 1109. In each the sociological character of the work, as well as the strictly religious services, finds enthusiastic support. Of those specified the West London Mission has seen some recent changes. The mission migrated from the St. James's Hall to the large hall in Great Queen Street, Kingsway, and there for two or three years conducted a useful work, first under the Rev. Ensor Walters, and after his removal to Sheffield in 1907, the Rev. J. E. Rattenbury. In October, 1908, the Kingsway hall being vacated meantime and partly demolished, the Lyceum Theatre (of Sir Henry Irving fame) was taken for a period of two years, with further options, for carrying on the work of the mission. In other parts of London and in many of the cities of the United Kingdom, such as Birmingham, Leeds, Nottingham, Bolton, etc., progressive work of a similar character is being carried on. Where it exists the Institutional movement stands to the people for a positive social centre, having just as much "churchiness" as ever, but with the distinctive Church elements co-ordinated with its multifarious social agencies. This type of Church is in reality a large social club, based on the fundamental doctrine of Christian brotherhood, and wedded to the promulgation of Christian beliefs.

IRISH TRADE UNION CONGRESS: (See under TRADE UNION CONGRESS, IRISH.)

ITO, and ITOLAND: (see JEWISH TERRITORIAL ORGANIZATION.)

J

JEWISH TERRITORIAL ORGANIZATION, (ITO): Founded in 1905 at Basle. Object: To procure a territory upon an autonomous basis for those Jews who cannot or will not remain in the lands in which they at present live. The word "Ito" means Jewish Territorial Organization.

The special work of the Emigration Regulation Department of Ito is to divert the existing spontaneous stream of Jewish emigrants from New York to Galveston, and thence, as far as possible, to States west of the Mississippi. The headquarters of the Department are in London. In order to carry out the object of the Department, special Committees have been formed in Russia, the U. S. A. and other countries. Up to December 31st, 1907, the number of emigrants despatched by the organization to the new American "Itoland" was 672 men, eighty-two women, and seventy-nine children.

Hon. Secretary: Mr. Clement I. Salaman, King's Chambers, Portugal Street, London, W.C.

Speaking at Manchester in December, 1907, the President, Mr. Israel Zangwill, said—

"Rome was not built in a day, neither will a Jewish State be built in twenty-four hours. As the life of a State exceeds vastly the life of a man, so is its infancy proportionately long. Before a territory is fully 'procured,' *i.e.*, made capable of receiving all those 'who cannot or will not remain' in other lands; before railways and ports are built; before towns arise and factories are established, and mines are working, many years must pass. The foundations of a Jewish land must be laid slowly and cautiously in our best human material. To try to solve our emigration problem without an autonomous Territory is to build on sand; but to expect that such a Territory can receive our emigration immediately is to build on air. This is the dilemma of the Jewish position. No undeveloped land could receive our emigration. No developed land would afford us autonomy. If we grasp at an immediate solution we shall never get a final solution. If, on the other hand, we try for a final solution, we are left with the immediate problem. What is the escape from this dilemma? Why, the way the Ito has found—to try both for the temporary solution and the final solution; with one hand to work for the present, and with the other for the future."

K

KYRLE SOCIETY, THE: Founded in 1876. Object: For bringing beauty home to the people. The Society owes its origin to a letter by Miss Miranda Hill, calling attention to the dull, commonplace lives of the poor, and suggesting that means taken to enliven and better those lives would be labour well spent. The name "Kyrle" was taken from Pope's lines eulogizing John Kyrle, the "Man of Ross." President, H.R.H. Princess Louise. *Hon. Secretary:* Miss Lilian James, 2, Manchester Street, London, W.

L

LABOUR CHURCH UNION, THE: Founded in 1892. Object: To give expression to the religion of the Labour Movement. There are about thirty Churches in England and Wales with three thousand members. President, Mr. Lewis Watson, Ashton-under-Lyne. *Secretary:* Mr. John Mitchell, 13, Moorwell Place, Eccleshill, Bradford.

LABOUR CONCILIATION AND ARBITRATION BOARD, LONDON: (Formerly the London Conciliation Board.) Founded in 1890. Object: To promote amicable methods of settling labour disputes and the prevention of strikes and lock-outs. As showing the continuity of the Board's work, there were in existence, up to August, 1908, fifteen voluntary agreements, in some of which the parties are bound to give notice of termination through the Board, which is also expressly recognized, in the majority of cases, as a body to deal with any question that may arise in connection with them; there were in existence twenty-seven awards, which may be regarded as more or less permanent settlements of matters in dispute by the Board. Where, from altered circumstances, a modification of an award has been sought for, there has as yet been no difficulty in re-opening the subject, and pronouncing a judgment. The employers on the Board (twelve) are annually elected by the London Chamber of Commerce and the labour members (twelve) by the Metropolitan Trade Unions. Chairman, Sir S. B. Boulton, Bart. *Secretary:* Mr. Kenric B. Murray, London Chamber of Commerce, Cannon Street, London, E.C. (See also ARBITRATION AND CONCILIATION.)

LABOUR CO-PARTNERSHIP ASSOCIATION: Founded in 1884. Object: To bring about an organization of industry based on the principle of labour co-partnership, wherein all those engaged shall share in the profits, capital, control, and responsibility. Official organ, *Co-Partnership*, monthly, 1*d.* President, Right Hon. Arthur J. Balfour, M.P. *Secretary:* Mr. Henry Vivian, M.P., 6, Bloomsbury Square, London, W.C.

The following figures show the progress in Great Britain of the Workmen's Labour Co-partnership Societies since the Association was formed:—

	1883.	1893.	1907.
Societies ..	15	77	112
Capital ..	103,436	619,153	1,865,610
Trade ..	160,751	1,115,842	4,108,807
Profit ..	9,031	65,387	203,445
Loss ..	114	2,112	4,321
Divi. on wages	not known	8,225	25,017

LABOUR DEFENCE, FREEDOM OF: An association formed to protect workers, especially adult women workers, from restrictive legislation which would lessen their wage-earning capacity, limit their personal liberty, and inconvenience them in their private lives; also to maintain the rights of women in regard to the nature, hours, and conditions of their employment. President, Lady Frances Balfour. *Secretary:* Miss Edith Lawson, 48, Buckingham Palace Road, London, S.W.

LABOUR EXCHANGES: (See under UNEMPLOYMENT.)

LABOURING CLASSES, SOCIETY FOR IMPROVING THE CONDITION OF THE: Founded in 1844. Object: The improvement of the condition of the dwellings of the labouring and artisan classes by the provision of improved tenements. *Secretary:* Mr. Alfred Humphreys, F.C.I.S., 4, Bloomsbury Mansion, Hart Street, London, W.C.

LABOUR PARTY: In addition to details given on page 685, the report of the Eighth Annual Conference held in Hull in January, 1908, indicated a total membership of 1,072,413; trade unions affiliated, 181; local labour parties affiliated, 92, with increase of membership from the affiliation with the Independent Labour Party and the Fabian Society, 22,267. Owing to the imposition of the Parliamentary levy one of the co-operative societies affiliated last year dropped out; the other, Tunbridge Wells, continues its affiliation.

The following table shows the growth of the party since January, 1900:—

	Trade Unions. No.	Membership.	L.R.C.'s No.	Trades Councils and Socialist Societies. No.	Membership.	Total
1900-1	41	353,070	7	3	22,861	375,931
1901-2	65	455,450	21	2	13,861	469,311
1902-3	127	847 315	49	2	13,835	861,150
1903-4	165	956,025	76	2	13,775	969,800
1904-5	158	885,270	73	2	14,730	900,000
1905-6	158	904,496	73	2	16,784	921,280
1906-7	176	975,182	83	2	20,885	998,338*
1907-8	181	1,049,673	92	2	22,267	1,072,413†

* This total includes 2271 Co-operators.
† Includes 473 Co-operators.

LABOUR PARTY, INDEPENDENT: (See INDEPENDENT LABOUR PARTY.)

LAND SOCIETIES: (See under THRIFT.)

LAND VALUES, TAXATION OF: The value of the land in the United Kingdom can only be approximately estimated, as there are no real statistics for guidance in the matter. Only land yielding an income is referred to in the Income Tax Returns, and local taxation is based upon occupancy. Agricultural land, for instance, can only be estimated at its Income Tax valuation, namely, £52,000,000. The adequate and just taxation of land has been the subject of much discussion in recent years, one section of the reformers contending that the present system of valuing land according to the return it brings when in use works badly, and that pressure should be brought to bear upon those who are keeping land out of use, or putting it only to an inferior use. They argue that the land should be valued at what it would bring if put to a proper and full use. Further, it is contended that the increased value of land due to the labour and expenditure of the whole community belongs to those whose efforts have made it—the community—and that means should be devised to secure for the community that increased value; one method being to secure it by taxation, which involves, in the first place, the separate assessment of land and buildings where they exist together.

A New Bill

Recent movements in this direction are to be found in the legislative programme, the early introduction of a new Valuation Bill for England having been promised by the Prime Minister in a speech on April 20th, 1907, in which he indicated the lines upon which the proposed measure was likely to run. "In providing," he said, "as we propose to do, for making a separate valuation of the value of the land apart from buildings and improvements, we shall be preparing the way for a reform of the rating system in our urban areas which is urgently needed and properly desired, and we shall at the same time very much simplify the process of the public acquisition of land by getting a record of how much of their value is due to improvements and how much to the annual value of the land. It is an indispensable preliminary step. It will show us what the land values are and where they are." The Bill was intended to have been introduced

in the House of Commons by the President of the Local Government Board during the ordinary Session of 1908, but its introduction had to be postponed, and was looked for early in the special Autumn Session of Parliament following.

Meanwhile, on July 9th, 1908, the Land Values (Scotland) Bill passed the House of Lords. Reviewing the position as then existing, the August number of *Land Values* said: "In the first place the Lords, by passing the Bill as amended, concede that it is possible to value and tax the land apart from the value of buildings and improvements. The alleged impossibility of separate valuation is now definitely abandoned. Secondly, it is conceded by the passing of the Bill as amended that among the improvements the value of which can be separated from land value, are drainage and reclamation work, levelling, and the like, the value of which is unexhausted at the time of the valuation, and that such land is a proper subject for land value taxation whether or not buildings have been actually erected on it. Thirdly, the Bill as amended, although optional, applies equally to town and country, and the old contention that the principle is applicable only to urban districts, is therefore given up. Fourthly, the definition of yearly land value provides that 'in the case of land proved to be required in the public interest at the time of valuation for building or industrial purposes, and to be unreasonably withheld from use for such purposes, the yearly land value shall be estimated as if such land were in use for the purposes aforesaid.' This definition clearly recognizes that it is possible, and in some cases may be desirable and necessary, to value land on the footing of its being put to a use to which it is not being put at the time. It admits that land may be found to be unreasonably withheld from use for building or industrial purposes contrary to the public interest, and that in such case the proper course is to enter the value of such land as if put to the purposes for which it is required."

In Scotland

The United Committee for the Taxation of Land Values in July, 1908, addressed a "plea of urgency" to the Government, in which the situation is comprehensively dealt with. Referring to the passing into law of the Small Holdings Act and the pressing forward of the Housing and Town Planning Bill, they point out that "those measures are not economic measures in the sense that a Land Values Bill would be. They make no change which would tend generally to induce all those who control the land to allow it to be used on more reasonable terms for the purposes to which it could best be put and for which it is required. They do nothing to affect universally the economic relation between the owners and the would-be users of land." Transfer of rates on to land values is described as the true housing policy, which would allow building to proceed. "In such situations as the margins of towns, the ground rent or land value usually represents about one-fifth of the rateable value on which rates are now levied. If charged on land values, therefore, the rates on such property would be only two-fifths of the amount levied under the present system, even assuming that the rate in the pound on land values would have to be double the present rate in the pound on rateable values." Rating of land values is further advocated as a means of securing equitable distribution of burdens and preventing undue enhancement when land is required for public use.

A Plea of Urgency

On the benefits of taxing land values, reference is made in the *Financial Reform Year Book* (1908) to an argument adduced that as the total rental of the landowners is only £100,000,000 a year, the taxation of land values would be a very trifling reform, and it is pointed out as against this that there is a vast difference between the value of the land and the amount of rent received by the landowners. Statistics are also provided giving an approximate estimate of the value of land in the United Kingdom, as follows:—

"If we value London land at the same rate as New York, viz. sixty per cent. of total of Income Tax valuation for both land and houses; Lancashire, Yorkshire, Middlesex, and Essex at forty per cent.; and the houses in the rest of the kingdom at twenty-five per cent., we have value of land in London sixty per cent. of £46,019,333, or £27,612,000; Lancashire, Yorkshire, Middlesex, and Essex, forty per cent. of £53,020,000, or £21,208,000; land value portion of house property in rest of kingdom, twenty-five per cent. of £106,447,000, or £26,612,000. Total for town land values, £74,432,000.

Total Land Values

"Then we have the profits of railways, mines, gasworks, ironworks, waterworks, canals, quarries, tolls, springs, shooting rights, all to a large extent land values, amounting to £82,338,000; taking one-eighth we have £10,300,000. At the present prices of coal and ironstone, the royalties, dead rents, mine rents, wayleaves, airleaves, etc., will come to over £10,000,000 on the quantity of these minerals turned out last year. Then it must be remembered these values are all less rates, and if the rates were paid from some outside source the rents would be raised so as to absorb the amount so saved. Thus the amount raised in rates must be added to these land values. Thus we have—

Agricultural land	£52,000,000
Building land	74,000,000
Mint rents, royalties, etc. ..	10,000,000
Railways, mines, etc.	10,000,000
Rates, tolls, etc.	70,000,000
	£216,000,000

"None of these items will bear much scrutiny, either by those who think the amount ought to be less or those who think it ought to be more, but it will serve as a basis for calculation.

"We thus perceive that in times of peace the land value of the kingdom amounts to more than the cost of government, both local and national; therefore, both the Local Authorities and the Chancellor of the Exchequer could avail themselves of the new source of revenue. The tax ought to be both local and national. But the economic effects of taxing land values would be far greater than the financial. The tax would break down the land monopoly, which exercises such a baneful influence upon the welfare of the people, for it lowers wages, causes overcrowding in towns, sweating, and, briefly, is the root of almost all the economic evils we suffer from. It is necessary, therefore, that the tax should be extended to all land, and not confined, as many seem to think it should be, to town lands. Agricultural, town, and mineral lands should all be subjected to the tax if we are to alter the present system, by which labour is deprived of its proper reward."

LAW ASSOCIATION, THE INTERNATIONAL: Founded in 1873. Object: The reform and codification of the law of nations. The Association holds biennial conferences, the most recent being at Budapesth, in September, 1908. Chairman, Sir Walter G. F. Phillimore, Bart., D.C.L. *Hon. Secretaries:* G. G. Phillimore, B.C.L., M.A., and Thomas Baty, D.C.L., LL.D., 1, Mitre Court Buildings, Temple, London, E.C.

"L'ENTENTE CORDIALE" ANGLO-FRENCH ASSOCIATION: Founded in 1897 to promote and maintain friendly relations between the two peoples, by organizing lectures, dissemination of literature, etc. Number of members, 750. Chairman of Council,

Mr. A. Barton Kent. *Hon. Secretary:* Mr. W. H. Sands, 6, Fig Tree Court, London, E.C.

LIBERAL FEDERATION, SCOTTISH WOMEN'S: Founded in 1891. Objects: To promote and extend the knowledge of Liberal principles and to secure just and equal legislation and representation for women, especially with reference to the Parliamentary Franchise; and the protection of the interests of children. Membership, 14,129. Special work done: The organization of Women's Liberal Associations throughout Scotland. Official organ, *Scottish Liberal Women's Magazine*, monthly, 1*d*. President, The Lady Marjorie Sinclair. *Secretary:* Miss Alice Younger, M.A., 7, West George Street, Glasgow.

LIBERAL FEDERATION, WOMEN'S: Founded in 1886. The Federation has 635 affiliated branches, with an approximate membership of 94,600. Official organ, *Summary of Federation News*, monthly, 1½*d*. President, The Countess of Carlisle. *Secretary:* Miss Margaret Bunney, 124, Victoria Street, London, S.W.

LIBERATION OF RELIGION FROM STATE PATRONAGE AND CONTROL, THE SOCIETY FOR THE: Founded in 1844. Objects: (1) The abrogation of all laws and usages which inflict disability, or confer privilege, on ecclesiastical grounds, upon any subject of the realm; (2) The discontinuance of all payments from public funds, and of all compulsory exactions, for religious purposes; (3) After an equitable satisfaction of existing interests, the application to strictly National purposes of the National property now held in trust by the Established Churches of England, Wales, and Scotland; and, concurrently therewith, the liberation of those Churches from State control. The Society has over twelve thousand members and subscribers. The Disestablishment Council for Scotland (*q.v.*) works in co-operation with the Society, which is now turning its special efforts towards disestablishment in Wales. Official organ, *The Liberator*, monthly, 1*d*. President, Rev. John Clifford, M.A., D.D. *Secretary:* Mr. David Caird, Caxton House, Tothill Street, Westminster, London, S.W.

LIBRARIES, PUBLIC: Public libraries have now become an integral part of municipal life. The early Acts were consolidated into the Public Libraries Act of 1892. This was amended by the Acts of 1893 and 1901. Although the 1892 Act limited the rate to one penny in the pound for libraries, there have been several instances where it has been increased; thus at Bury it is threepence in the pound, and at Brighton fourpence in the pound. It will be common knowledge that all over the country Mr. Andrew Carnegie and Mr. Passmore Edwards (in lesser degree) have provided the means for establishing libraries in a large number of towns. In January, 1908, there were about eight hundred public libraries in the United Kingdom, and the number of volumes in circulation was 4,409,565 in the lending libraries and 2,315,050 in the reference libraries. At the congress of the Library Association held in Brighton during August, 1908, one of the latest developments discussed was that of a "circular ticket," whereby a borrower need not be restricted to the libraries within his own municipality for obtaining books. This innovation is in practical operation. The public libraries of Woolwich, Poplar, Stepney, and other districts in London and Greater London have agreed to lend books to one another on application from borrowers, readers in these libraries, which embrace more than a score of lending libraries, being thus permitted to use an aggregate stock of nearly 200,000 volumes.

It is hoped to extend this system of interchange to public libraries throughout the Metropolis, and if the movement proves successful the logical outcome will be to make borrowers' tickets interchangeable throughout the Metropolis, and even further afield.

LICENSING BILL: By a long way the most sweeping measure of social reform advocated in the House of Commons during 1908 was this much-discussed measure, as introduced by the Rt. Hon. H. H. Asquith, then Chancellor of the Exchequer, on February 27th, the consideration of which still continues (October, 1908).

The Bill, as originally framed, contained the following provisions:—

1.—A Time Limit of fourteen years to the compensation clauses of the Act of 1904. At the end of the fourteen years all licences are to be considered new licences—subject to pay monopoly value, etc.

2.—Reduction of Licences. A gradual and compulsory reduction in the number of licences, so that at the end of fourteen years they shall not exceed one licence to every four hundred persons in country places, nor more than one to from six hundred to one thousand persons in towns. Extensions of licensed premises to be liable to pay monopoly values.

3.—Sunday Sale of Drink in the provinces to be limited to one hour in the daytime and two hours in the evening. The *bonâ-fide* traveller will have to go six miles instead of three miles before he can be served with alcoholic drink.

4.—Magisterial Discretion. The power taken from the Licensing Magistrates by the 1904 Act is to be restored and enlarged—thus the local Licensing Authority will be enabled to impose conditions on licences regarding complete Sunday closing, closing on election days, exclusion of children from drinking bars, the employment of women and children, the long pull, etc. And the appeal to Quarter Sessions is to be abolished in large boroughs.

5.—Compensation. The levy for compensation is to be national and compulsory. A better method of assessment is to be adopted, and it is claimed that the licensee will, under this Bill, be better treated than under Mr. Balfour's Act.

6.—Local Option is to be applicable immediately to new licences, and the same principle is to be applied to all licences at the termination of the Time Limit.

7.—The freedom of clubs is interfered with as little as possible, but power is given to the justices to stop bogus drinking clubs.

The Bill also deals with the abuse of beer-hawking, control of off-licences, betting on licensed premises, sale of drink on passenger vessels, and other points of immediate and practical value.

The most striking speech in the House of Commons during the second reading of the Bill was that of Sir Thomas Whittaker. He stated that

"The Bill fixes a maximum number of houses in proportion to population, and not a very low one where the houses are redundant. The majority report of the Royal Commission on Licensing, which it must always be remembered was signed by the chosen representatives of the liquor trade, said: 'We regard a large suppression of licences as essential.' They also recommended a reduction in Scotland. In England there are fifty per cent. more licences in proportion to population than in Scotland."

He combated Mr. Austen Chamberlain's opposition by quoting his father, the Rt. Hon. Joseph Chamberlain, in his evidence before the House of Lords' Committee on Intemperance, who said: "The enormous number of public-houses, which is clearly out of all proportion to anything like the legitimate wants of the people, must tend to increase temptation."

After dealing with various phases of the Bill, Sir Thomas Whittaker thus treated the question of the legal right of tenure in licences—

The Time Limit

"As to the question of the time limit, there is no legal right to the renewal of an ordinary public-house licence beyond a year. It is an expectation and nothing more. It has been repeatedly declared to be so, and the brewers themselves in their manifesto issued at the beginning of this year say that all they claim is an expectation, and not a right. The law is perfectly clear, and the whole object of an annual licence is not to review the conduct of the licence-holder only, but to review the whole position. It has been said that it must be a judicial decision. What can be more judicial than a decision that the licence is not required, and that it is desirable in the public interest that it should cease? That is a good and judicial reason. We have had in the course of this

debate a great many quotations, but I should like to quote what Lord Halsbury said in 1897 in the Boulter case: 'You draw a distinction between the original granting of the licence and the renewal of the licence. One must clear one's mind and see what it is. It is a new licence for the new year. It is important to observe the accuracy of language. It is not a renewal of the licence, it is another licence for another year.' That unquestionably is the strict law."

For the Government he claimed, in regard to the fourteen years' time limit, that all legal right was on their side, but that they recognized much money had been invested. At the same time, Sir Thomas argued that "in the interest of the public well-being the nation must have full control over its own licences." This fourteen years' time limit did not mean that all the houses were going to be closed, but that then they should "start afresh and charge the proper fee for the licence;" and that the nation would resume its dominion over its own licences. The monopoly value of the licences he computed to figure at £95,000,000, and in demonstrating that the time limit did not unfairly press upon publicans, said: "During the time limit a number of these houses will be wiped out and paid for. The owners will get £12,000,000, and that leaves £83,000,000 to be provided by the trade at the end of the time limit, and they have altogether got towards it, I find, in one way or another, £15,000,000 to £20,000,000. That means they have £63,000,000 to £68,000,000 to provide, call it roughly £70,000,000—which at four per cent. means £3,500,000 a year, and at five per cent. £3,250,000. That is what they have to deal with, and I say that every other trade in the country, almost every year of its existence, has to cope with greater variations of cost and price than these figures represent."

During the further discussion of the Bill in October, 1908, the Prime Minister hinted that the possible emendations might include some elasticity on the time limit to, say, twenty-one years.

The opinion of the Labour Party with regard to the temperance reform is shown by the resolution passed with acclamation at their annual conference in 1907: "That any measure of temperance reform should confer upon localities full and unfettered power for dealing with the licensing question in accordance with local opinion. By this means localities should be enabled to (*a*) Prohibit the sale of liquor within their boundaries; (*b*) Reduce the number of licences and regulate the conditions under which they may be held; and (*c*) If a locality decides that licences are to be granted, to determine whether such licences shall be under private or any form of public control."

The Fabian Society gives as the Socialistic solution of the drink problem that it should provide "public control, real trust in the people and their representatives."

The Bill is viewed by the licensing trade as "confiscation and robbery." By the Bill they allege, in *Fifty Points against the Licensing Bill* (Licensed Victuallers' Central Protection Society of London, Ltd., 1*d*.), that "the investor is to be robbed of the interest of his investment, and part at least of his capital, while the trader is to be robbed of the reward of his industry in the shape of goodwill."

Opposing Views

They further maintain: "What the Government really propose is to deplete the resources of the publican by annual contributions to the extinction of licences during the reduction period, and at the end of the fourteen years appropriate without any compensation the value of the licences which have survived."

Another contention advanced by the trade is that "the Bill distinctly attacks the generally accepted theory of individual liberty, that a man has the right to do that which does not interfere with the equal liberty of all." In another pamphlet, *The Real Facts about Public-house Reform* (issued by the same Society), they say the Government "seek to pass a Bill by which one-third of the public-houses in England are to be shut up before the end of fourteen years. The licence, which is the most essential and valuable part of those houses, will then be resold, in some cases to the men who have already bought and paid for them once, and the State—which really means any little body of irresponsible faddists who may be in power at the time—will be able to impose any restrictions they choose to make as a condition of sale."

In a further leaflet, *Sober by Act of Parliament* (Common Sense Library, 1*d*.), occurs this argument on behalf of the publicans: "The only legislative coercion which has any share in the increasing sobriety of the nation is the kind which consists in providing police supervision of public-houses, and makes it a criminal offence to serve a drunken person—and the influence even of such legislation may very easily be exaggerated, for it is less, for example, the fear of police proceedings which keeps a publican from serving an intoxicated customer than the desire to keep his house respectable, which in many cases means keeping his business together."

LOCAL GOVERNMENT INFORMATION BUREAU: Founded in 1900. Membership, 191. *Address:* The Fabian Society, 3, Clement's Inn, Strand, London, W.C.

LODGE, SIR OLIVER JOSEPH: M.Sc., F.R.S., D.Sc., London. Also honorary D.Sc. of Oxford, Victoria, and Liverpool Universities; and LL.D., of St. Andrews, Glasgow, and Aberdeen. Sir Oliver is specially well known as a scientist, philosopher, and social reformer; and also has special interest in the interpretation and spreading of religious knowledge. He was born at Penkhull, Staffordshire, in 1851, and is Principal of the University of Birmingham. Sir Oliver is a profound thinker and is the author of several books on scientific, psychological, religious, and reform matters. He also contributes topical articles to the *Hibbert Journal*, *Homiletic Review*, etc. His books on social reform deal chiefly with child life, though this is by no means the only side of reform he studies. He believes that children should have a sound religious education. At the Annual Conference of the British Child Study Association, held in Birmingham in 1907, he delivered an address on the "Religious Education of Children," in which he stated that such education should have the attributes of indirectness and continuousness; that they were teaching religion by forming habits of cleanliness, order, punctuality, and courtesy, and by helping children to make animals happy and responsive; by teaching them to take care of their garden, to plant some flowers, and by turning the instinct of destruction into one of creation. He further said that religion to children should not be based on the doctrine of sin. He has drawn up a New Catechism for little children, which teaches duty towards God and man without reference to creed or sect. As a public lecturer and speaker his apt and witty diction is well known.

Address: Mariemont, Edgbaston, Birmingham.

LONDON: That part of the administration of London coming within the powers of the London County Council comprehends a wide range of departments. The most recent developments are dealt with below. For a general résumé of the bodies governing the county of London, and the particular sphere of their operations, see LONDON, LONDON COUNTY COUNCIL, EDUCATION, SCHOOLS.

The general question of the administration of Education in various parts of the world, including London, is dealt with under separate sections (see SCHOOLS, EDUCATION, TECHNICAL SCHOOLS, etc.), and the latest legislative proposals are detailed under the EDUCATION BILL. Certain recent

Education

developments in Educational systems are given individual treatment below.

Upon the recommendation of its Education Committee, the London County Council in March, 1908, decided upon the recognition of voluntary committees or associations formed for the purpose of providing evening play centres or other means of recreation for the children, with the view of their being granted the use, free of charge, of schools or class-rooms. The Education (Administrative Provisions) Act, 1907, made provision for children attending public elementary schools in the matter of vacation schools, play centres, etc., during holidays, and under this provision the County Council has made full use of its powers. A report of the Day Schools Sub-committee, made on March 4th, 1908, stated that the total number of schools let for such purposes was 110, of which number eighty-three were let to the Children's Happy Evenings Association, fourteen to the Evening Play Centres Committee, and thirteen to other agencies. In connection therewith, manual training, cookery, laundry work, gymnastic, and other apparatus is loaned by the Council for the purposes of vacation schools, provided that the voluntary associations can satisfy the Council that a suitable person will be in charge of the apparatus. While the Council accept no financial or other responsibility they retain the right to inspect the work of any association or committee. An estimate of the expense entailed upon the Council in connection with these schools places the amount at under £2000. The Walworth Vacation School may be taken as a typical example of the lines upon which these schools are run :—

Vacation Schools

The report of the Education Committee for 1907 showed that 257 of the poorest children of Walworth who did not succeed in obtaining a stay in the country during the summer holidays were provided for by the holiday school, and during 1908 it was decided that the school should be open for four weeks, beginning on the first day of the ordinary holidays, when it was hoped to accommodate three hundred children for the first fortnight and another three hundred for the second. It was proposed that, with the consent of the Council, the school should be held at the Royal-hill London County Council school, near Greenwich Park, as being the most convenient that could be found for the purpose. It had the advantage also of being sufficiently near Blackheath for cricket pitches to be reserved on the heath, and for various other games to be played there. Visits could also be paid to swimming baths. The nature of the instruction arranged was an attractive blending of work and play, the classes covering such subjects as musical drill, ambulance, drawing and painting, singing, the study of flowers, and story-telling. Anything in the nature of formal instruction is avoided as far as possible, and the health and recreation of the children made the first consideration. Dinner and tea are given to the children, and the Ragged School Union undertook also to pay the fares of the children to and from the school on the trams.

With regard to the teaching staff, it was considered that many of the teachers who have just left college would be glad to undertake the work, and it was suggested that each teacher should work for only a fortnight out of the period during which the school was open. It was proposed to engage three ambulance drivers to look after the assembly of the pupils at Pollock-road, supervise their journey on the tramcars, convey them to the school at Greenwich, and act similarly in respect of the return journey. It was also proposed to obtain the services of a bathing instructor from the Royal Naval College, who would undertake the swimming for an almost nominal charge. The managing committee asked that the Council should defray the expenses in connection with the salaries of teachers, wages of caretaker, nurse, ambulance drivers, bathing instructor, and incidentals, amounting in all to about £100 for the period of four weeks.

It was the opinion of the Education Committee, that the Council should not incur any actual expense in the matter beyond what would naturally be incurred in connection with the use of the Royal-hill School as a vacation school, but they thought that the recognition of the school, if granted, should be under the same conditions as those imposed in respect of other institutions of the same nature. As it did not seem probable that the recommendations with reference to the recognition of such schools could be submitted to the Council before the summer recess, the Education Committee proposed that recognition should be granted under the same conditions as had been imposed in previous years. In the event, however, of the matter being dealt with by the Council before the school was opened, they were of opinion that any new regulations made by the Council should be applied. They therefore suggested that favourable consideration should be granted to any application made by the managing committee for the recognition of the school under these terms.

At the close of the holidays, August 26th, 1908, the experiment was viewed as having proved a success, and an extension of the system will doubtless result.

Medical Inspection

By the Education (Administrative Provisions) Act, which came into force on January 1st, 1908, provision is also made (section 13, i. b.) for the medical inspection of the children attending elementary schools. In a memorandum on the subject, issued by the Board of Education to Local Education Authorities on November 23rd, 1907, the intention of the Legislature was explained as follows—

The fundamental principle of Section 13 of the new Act is the medical examination and supervision not only of children known, or suspected, to be weakly or ailing, but of all children in the elementary schools, with a view to adapting and modifying the system of education to the needs and capacities of the child, securing the early detection of unsuspected defects, checking incipient maladies at their onset, and furnishing the facts which will guide Education Authorities in relation to physical and mental development during school life. The character and degree of medical inspection will depend on the standpoint from which the subject is viewed, the difficulty being, of course, to attain a due sense of proportion and uniformity, particularly as to fundamental points. Valuable to science though the findings of a more thorough and elaborate medical examination might be, it is the broad, simple necessities of a healthy life which must be kept in view. It cannot be doubted that a large proportion of the common diseases and physical unfitness in this country can be substantially diminished by effective public health administration, combined with the teaching of hygiene and a realization by teachers, parents, and children of its vital importance.

This view "required that the work of medical inspection should be carried out in intimate conjunction with the public health authorities, and under the direct supervision of the medical officer of health." The Memorandum therefore laid it down that, generally speaking, the work of inspection should be supervised by the medical officer of health (with assistance where necessary) of the authority which appoints the Education Committee. Where there is no County medical officer, the Board of Education consider that the duties of medical inspection under the Act "render it inadvisable any longer to postpone such an appointment." The Board were of opinion that the work of medical inspection could not be properly accomplished by medical men without assistance. The teacher, the school nurse, the parents or guardians of the child must co-operate with the school medical officer, and Education Authorities were specially recommended to invite parents to be

present at the first inspection, so that misunderstandings might be avoided and prejudice disarmed. Only one inspection during a child's school life is obligatory by the Act, but the Board in the exercise of the powers conferred on them, decided that not less than three inspections during the school life of the child are necessary to secure the results desired. The first inspection should take place at the time of, or as soon as possible after, admission to school; the second at or about the third year (say, the seventh year of age); and the third at or about the sixth year of school life (say, the tenth year of age). A further inspection immediately before the departure of the child into working life is considered desirable where practicable, and in some areas it may be best for this to take the place of the third inspection.

Discussing the statements made at the International Congress on School Hygiene, held in London, the *New Age* of August 15th, 1907, drew attention to the statement of Sir William Osler, Regius Professor of Medicine at Oxford, that there was no progress to be reported since the last Congress, held three years before at Nuremberg. He told the Congress that ninety per cent. of the children suffered from defective teeth, that fifty per cent. suffered from vermin, twenty-eight per cent. were mouth-breathers through disease of the nose, that twenty-five per cent. were very dirty, and thirteen per cent. suffered from malnutrition. The County Council had just agreed to spend £500 on furniture for the meals at some of its schools. Did the most rigid vegetarian believe that deal tables would allay the hunger of its 120,000 starving school children? After Dr. Osler's list, came the comparatively cheerful announcement from Dr. Ivens that one-third of the children had deficient hearing, and from Dr. Wright that out of 52,000 Glasgow school children examined thirty-five per cent. had defective vision, nearly one-half being due to mental deficiency, partly arising from malnutrition.

Open-air Schools

In the matter of open-air schools London has followed the lead of Germany, where the movement was first begun at Charlottenburg. The result of the experiment in this direction at Bostal Woods was so satisfactory that the Education Authority of the London County Council decided to increase the previous year's grant of £400 to £2000 for 1908, in order to provide three open-air schools in different parts of London. The places selected were Shooter's Hill (which took the place of Bostal Woods), Forest Hill, and Kentish Town. The schools are open from June 1st to October 31st, and each provides for seventy-five children, divided into three classes of twenty-five each. The staff consists of one head and three assistant teachers, a nurse, a cook and helper, and school keeper. It is expected that with Government grants the £2000 will cover all expenses, except the absolutely necessary school-feeding. For this private funds are relied on.

At their meeting in March, 1908, the London County Council, on the recommendation of the special schools sub-committee, agreed to the erection of a new permanent school for seventy physically defective children to be erected on a site at High Street, Limehouse, London, E., in addition to others already existing in Greenwich and other parts of the metropolis.

Physical Defects

The Consultative Committee of the Board of Education, of which the Rt. Hon. A. H. Dyke Acland was chairman, in an exhaustive report issued in September, 1908, expressed the unanimous opinion that the best training for children between three and five years of age is that obtained from their mothers in their own homes, provided the conditions are good, but they emphasized the urgent need for making some public provision for infants, below the age of compulsory attendance at school, where home conditions are imperfect. Live pets, flowers, and toys were recommended for use in Kindergarten schools, with a view to making them a real "children's garden" instead of a stuffy, map-hung class-room. Among other recommendations the committee said that infants should be allowed to sleep when they are drowsy. They should be encouraged to sleep in the open air, under proper conditions, and the committee recommended the provision of net beds for sleeping infant scholars. Freedom of movement, constant change of occupation, frequent visits to the playground, and opportunities for sleep were essential, while great discretion should be allowed the teacher in the absence of a rigid time-table, and classes should be limited to thirty. Special attention was drawn to the need for adequate provision being made in the matter of light, air, and sunshine in arranging the children's class-rooms. Heavy desks and galleries should never be used, since they lent themselves to forms of instruction unsuitable to young children and injurious to their physical development. Small tables and chairs were recommended instead, as these could be more easily put on one side to make room for games and play. The report described the committee's conception of an ideal infant school, the main idea of which was freedom from mental pressure and physical discipline, and from all formality in teaching. Such a school should be roomy, well lighted, warmed, and ventilated, and the following apparatus was recommended:—

1. Light chairs and low kindergarten tables.
2. Net-beds, or other suitable and sanitary provision for sleeping.
3. Blackboards fixed round the lower part of the walls.
4. Pictures, simple in design and outline, and brightly coloured.
5. Bricks of various sizes.
6. Large sand-troughs on wheels, for planting seeds and flowers, making "sand-pies," shell impressions, etc., with a supply of small spades and buckets.
7. Pets, such as goldfish and birds.
8. Plants, especially when grown by the infants themselves.
9. Swings, a rocking-horse, reins, balls, dolls, dolls'-house, Noah's Ark, and models of animals.
10. A piano.
11. Ample cupboards for toys, etc.

The lessons should include singing, recitations, some of the kindergarten gifts and games, and varied occupations, such as ball, brick-building, drawing on the blackboard, modelling in wet sand, reed and bead threading, rush-plaiting, matching and sorting colours and shapes, stick-laying, sand-drawing, picture and conversational lessons, nursery rhymes, story-telling, and story-acting.

Infant Instruction

The following occupations are specifically noted as not suitable for these infants: Mat weaving, clay modelling, tablet laying, needle-threading, pricking and sewing cardboard, and unravelling. As to ways and means, it was recommended that in assessing the school accommodation needed the industrial and social condition of the area should be considered. No obstacle should be raised to the admission of young children whose home conditions are unsatisfactory, and there should be the alternative of appeal to the Board of Education. The committee did not overlook the difficulties of country districts, and suggested that each case be considered on its merits.

In order to relieve local authorities as much as possible, the committee made the following special recommendations:—

(*a*) The rate of annual grant for infants should be raised so as to equal that for older scholars. If this cannot be done, owing to the increased cost, infants and older scholars should at least be paid for at the same rate per head, the actual amount of the rate being such that, while no additional charge would be placed on the Imperial Exchequer, as few local education authorities as possible

would receive a smaller aggregate grant than at present. If this also is impossible, the committee would recommend as an alternative that the higher grant of 22*s.* should begin to be given to children, not when they are promoted to the upper school, but when they reach a certain age. They believe that by this means the main inducement to subject young children to mental overpressure would be removed.

(*b*) The Board of Education should consider whether it would not be advisable to revert to the system by which grants were formerly paid in respect of individual children, who, to prevent infection, were temporarily excluded from school attendance by medical advice.

The enormous work of education, which has added so greatly to the burden of the London County Council, has increased the number of municipal servants to the extent of many thousands. In the elementary schools alone there were seventeen thousand teachers at the end of March, 1907, and in the evening schools four thousand were employed, while over three hundred men and women were employed as teachers in the technical institutes and art schools. At the same time there were three-quarters of a million children on the registers of the elementary schools. The cost of the year's educational work was £3,183,316.

Open Spaces

The annual report of the London County Council issued in August, 1908, shows that at the end of the twelve months under review, the London County Council was maintaining 110 parks and spaces with an area of 5036 acres. Additions during the year included the extension of Hampstead Heath, the dedication to the public use of Hainault Forest, and other well-situated open spaces. The provision of prepared pitches for games in the parks is a popular feature of the Council's policy in this connection. The numbers of games played in these prepared grounds during the year were: Lawn tennis, 102,649; cricket, 28,904; bowls, 24,749; football, 16,228; hockey, 2246; quoits, 2063; croquet, 1535; lacrosse, 120. A profit of £2015 was made on the Council's boats on the lakes in Battersea Park, Dulwich Park, Finsbury Park, and Victoria Park. More than twelve hundred open-air band concerts were given under London County Council auspices, the cost amounting to only ·06 of a penny in the pound.

Police

The police of London had, in February, 1908, a working force of 18,959, including the City police, who work only within the City area. The total mileage under their control is 10,892, the rateable value £52,911,670, and the population 6,581,407. The cost of this protection in 1907 was £2,453,115, of which £1,744,342 was for salaries. A Royal Commission was held in 1908 on the conduct of the police as a body, arising out of certain cases in which it was alleged there had been injustice. At the close of the Commission in July, 1908, the almost unanimous opinion was that for honesty and integrity the reputation of the force had been enhanced. Their organization and effectiveness have made them world-models. M. Lepine, the prefect of the Paris police, and the deputy head of the New York police are among those who have studied London methods for the betterment of their own systems. The City Police is under the control of Captain J. W. Nott Bower, whose salary is £1250 per annum.

Port of London

Various proposals have been put forward for municipalizing the Port of London or putting it under public control. The last Government's Port of London Bill, which provided for the transfer of the undertakings of the Dock Companies to a new body to be called the Port of London Commission, was before Parliament in the Session 1903. The measure, after the second reading in the House of Commons, was referred to a joint committee of both Houses. When Parliament reassembled it was announced that there was no intention of proceeding with the Government measure; and under these circumstances the London County Council promoted another Bill, which, in its main principles, followed the lines of the Government proposals. It differed, however, in regard to the membership of the Council on the proposed Port Commission. The second reading of this Bill was rejected on April 13th, 1905, by a majority of sixty-eight. On March 28th, 1906, Mr. Dickinson moved in the new House of Commons the following resolution, which was adopted without a division: "That this House is of opinion that the condition of the port and docks of London urgently demands attention with a view to the management thereof being forthwith placed in the hands of a public authority."

The proposition was that the authority should purchase the undertakings of (1) The London and India Dock Company; (2) The Surrey Commercial Dock Company; and (3) The Millwall Dock Company.

The following are the docks comprised in this enumeration:—

Dock.	Water area.	Depth.	Quayage length.	Made.
	Acres.	Ft.	Ft.	
East India ..	31·48	24·8	6,200	1806
West India ..	97·14	26·5 (import dock)	20,400	1802
St. Katherine	10·35	24 (neap tide on sill)	4,550	1828
London ..	38·72	24 ,, ,,	14,150	1805
Royal Albert	87·97	32 ,, ,,	17,250	1880
Royal Victoria	84·45	21·5 ,, ,,	22,000	1856
Tilbury ..	69·08	38 (Trinity high-water mark)	14,450	1868
Millwall ..	36·41	25·5 (neap tide on sill)	8,800	1886
Surrey Commercial ...	157·61	Various	27,420	1807

Port Authorities

The authorities now concerned in the government of the port comprise thirteen Governmental departments, two conservancy authorities, the eight dock companies, seven municipal authorities, four legal and judicial authorities, ten railway companies, and eight miscellaneous bodies. The principal are:—

I. Thames Conservancy.—For conservancy purposes, regulation of navigation, removal of obstruction, dredging, etc. The area of its jurisdiction differs in limits for various purposes.

II. City Corporation.—Port sanitary purposes from Teddington Lock seawards.

III. Trinity House.—Pilotage, lighting, and buoying from London Bridge seawards.

IV. The Watermen's and Lightermen's Company.

The others include the County Council, the Board of Trade, the Admiralty, and the police.

During November, 1907, a number of members of the London County Council inspected various Continental ports, and in November of 1907 a plan for the better operation of the Port of London was thus succinctly epitomized by the Chairman (Mr. C. J. C. Scott) and Deputy Chairman (Hon. Sydney Holland) of the London and India Docks Company. The plan is to strengthen the Thames Conservancy, making it the paramount authority in the port, but not to give that body power to own or provide any dock or river accommodation, *i.e.* to maintain the present system of private enterprise under which London has become the greatest port of the world with an annual tonnage of eighteen millions as against eleven million tons for Liverpool. It is proposed to abolish present exemption from port dues on goods from abroad (thereby giving effect to the recommendation of the Royal Commission), and to appropriate new port dues in such way as to justify the Company in raising and applying the capital necessary for the

construction of a new dock to the south of the Royal Albert Dock, for which Parliamentary powers were obtained six years ago, and also to enable the Thames Conservancy to raise funds for the deepening of the river, and for any future dock works as may be agreed between the Thames Conservancy and the dock companies.

Compulsory Powers

Power would be given to the Board of Trade to compel the dock companies to execute necessary improvements from time to time, only providing for reasonable protection to the interest of the dock proprietors, thus assuring that proper provision be made for traders' and shipowners' requirements.

Among concessions to shipowners and traders are proposed: (*a*) To reduce the dues on shipping from 1*s.* 6*d.* to 1*s.* per ton; (*b*) To submit to a maximum scale of dock rates, and to allow a reference to the Railway and Canal Commission, with a view of deciding any disputed questions as to the fairness of rates within the maximum; (*c*) To reduce by about twenty-five per cent. the dues in the schedule of port dues on goods; (*d*) To fix four per cent. as the maximum dividend payable on all stocks, withdrawing the clause for cumulative dividends which was objected to last year.

These authorities maintain that such a scheme would prove a more economical and efficient method of dealing with the problem than any scheme for municipalizing the docks, or of working them in combination by a trust on the Liverpool plan. It would avoid the great upheaval and inconvenience to business which would inevitably attend any gigantic purchase scheme, and there would be no complaint from warehouse keepers or wharfingers on the score of rate-aided or dues-aided competition.

The problem of the Thames waterway and the difficulties of keeping it clear have often engaged the attention of experts. One of the suggestions, from the Thames Barrage Committee, proposes to convert the Thames into a huge lake, into which steamers of any size could enter at any time, by constructing a dam across the river at Gravesend, and placing sluices and locks at intervals between that point and Teddington, the landward limit of the authority of the Port of London. The dam would rise six feet above the highest known tide. The top would be utilized for crossing traffic, by making it into a roadway one hundred feet wide, whilst further facilities would be provided by piercing the dam longitudinally with tunnels for rail traction, etc. The navigating connection with the sea would be achieved by building six locks into the dam, varying in size from one thousand feet long by 120 feet wide, down to five hundred feet long by sixty-five feet wide.

The Bill

On April 2nd, 1908, the Rt. Hon. Lloyd-George, then President of the Board of Trade, introduced his Bill "to provide for the improvement and better administration of the Port of London and for purposes incidental thereto." The Bill was at once favourably received by all parties, and it passed second reading in the House of Commons on May 6th, being then referred to a Joint Committee of the Lords and Commons, which represents its stage and progress up to September, 1908. The Bill, which is one of great length, contains the following salient features:—

The Port Authority may, subject to the provisions of this Act, do all or any of the following things:—

(*a*) carry on the undertaking of any dock company transferred to the Port Authority by this Act;

(*b*) construct, equip, maintain, or manage any docks, quays, wharves, jetties, or piers, and buildings, railways, and other works in connection therewith;

(*c*) exercise any other powers conferred on or transferred to the Port Authority under this Act.

As from the appointed day the undertakings of the London and India Docks Company, the Surrey Commercial Dock Company, and the Millwall Dock Company (which companies are in this Act referred to as dock companies) shall be transferred to and vest in the Port Authority, and the Port Authority shall issue to those companies, or as they may direct, as consideration for their undertakings the following amount of port stock created under this Act—

(*a*) in the case of the London and India Dock Company, seven million nine hundred and seventy-eight thousand eight hundred and seventy-six pounds of A port stock and nine million eight hundred and ninety-three thousand eight hundred and thirty-five pounds of B port stock;

(*b*) in the case of the Surrey Commercial Dock Company, five hundred and twenty-two thousand pounds of A port stock and two million three hundred and eighty-eight thousand four hundred and eighty-five pounds of B port stock;

(*c*) in the case of the Millwall Dock Company, six hundred and fifty-one thousand two hundred and seventy-six pounds of A port stock and nine hundred and twenty-eight thousand five hundred and four pounds of B port stock.

The stocks so issued shall be substituted for the existing stocks of the dock companies in accordance with the provisions of the Second Schedule to this Act, and on such substitutions being effected the existing stocks of those companies shall be cancelled:

Provided that no interest shall accrue due on any such existing stock in respect of any period after the appointed day but the port stock issued in substitution therefor shall carry interest as from the appointed day.

Transference of Powers

All enactments relating to the Conservators (except those regulating the funds and accounts of and borrowing by the Conservators) shall, so far as not repealed by this Act and so far as they relate to the rights, powers, duties, property, and liabilities transferred, have effect as if references to the Port Authority were substituted for references to the Conservators:

Provided that—

(*b*) in any such enactments references to the River Thames above and below Teddington Lock shall be construed as references to the River Thames above and below the landward limit of the Port of London; and

(*c*) in the definition of "the Thames" in section three of the Thames Conservancy Act, 1894, for "an imaginary straight line drawn from the entrance to Yantlet Creek in the county of Kent to the city stone opposite to Canvey Island in the county of Essex," there shall be substituted "the seaward limit of the Port of London.

Within six months after the appointed day or such further time as the Board of Trade may allow for the purpose, the Port Authority shall submit to the Board of Trade a schedule of maximum rates on goods, and the Board of Trade shall embody the schedule in a Provisional Order made for the purposes of this section, either without modifications or with such modifications as the Board think fit, and if the Port Authority fail within such period as aforesaid to submit to the Board of Trade such a schedule, the Board shall themselves prepare and embody in such a Provisional Order a schedule of maximum rates on goods:

Provided that the rates specified in the Schedule shall be such that, in the opinion of the Board of Trade, the amount of revenue produced thereby will, with the other receipts on revenue account of the Port Authority, be sufficient to meet the expenditure of the Port Authority on revenue account.

There shall be established a port fund, and all receipts of the Port Authority shall be carried to that fund, and all payments by the Port Authority shall be made out of that fund.

The Port Authority may borrow money for the purpose of—

(*a*) raising any money payable in respect of the transfer of the undertaking of any dock company under this Act;

(*b*) purchasing, redeeming, or paying off any debentures, mortgage debt, or other charge the liability for which is transferred to the Port Authority by or under this Act;

(*c*) dredging and otherwise improving the river;

(*d*) constructing works for improving the accommodation and facilities of the Port of London, or acquiring land for any such work;

(*e*) paying any compensation payable under this Act otherwise than by way of annuity;

and, with the consent of the Board of Trade, for the purpose of any payment by the Port Authority or of any work or other thing which the Port Authority are authorized to execute or do, and which or the cost of which ought, in the opinion of the Board of Trade, to be spread over a term of years. Such moneys shall be repaid within such period not exceeding ninety years, or within such period not exceeding sixty years, according to the purpose of borrowing, from the date of loan as the Port Authority with the consent of the Board of Trade may, having regard to the circumstances of each particular case, determine.

For the purpose of enabling the Port Authority to raise money which they are authorized to borrow, and to issue any port stock which, by or under the provisions of this Act, is to be, or may be, issued, the Port Authority may create stock, to be called Port of London Stock, and in this Act referred to as port stock.

The port stock so created shall consist of A port stock bearing interest at 3 per cent., and B port stock bearing interest at 4 per cent. per annum, and if the Port Authority so determine, of other classes of port stock ranking *pari passu* with B port stock and bearing interest at such rate as the Port Authority, with the consent of the Board of Trade and after consultation with the Governor of the Bank of England, may resolve.

The Port Authority shall carry to a reserve fund such part of the receipts on revenue account as are applicable to the purpose until the fund amounts to one million pounds, and if the fund is

subsequently reduced below that amount, the Port Authority shall carry to the fund so much of any such receipts as is required to restore the fund to that amount and is available for the purpose. The reserve fund so formed shall be applicable only towards meeting any deficiency on revenue account in any year.

The Port Authority shall as soon as may be after the appointed day take into consideration the then existing surveys of the bed and shore of the river and tidal waters within the Port of London, and if in any respect the surveys are defective they shall, after consultation with the Admiralty and the Board of Trade, take such steps as may be necessary for the purpose of remedying such defects.

Compensation

The Port Authority shall issue by way of compensation for the loss of office sustained by such of the directors of the several dock companies as were in office both at the date of the publication of the notice of the Bill for this Act and on the appointed day, the following amounts of A port stock:—

(*a*) to the London and India Docks Company sixty-seven thousand six hundred pounds;

(*b*) to the Surrey Commercial Dock Company forty thousand pounds;

(*c*) to the Millwall Dock Company twenty thousand pounds;

and the stock so issued shall be distributed amongst the directors entitled to compensation in such proportions as those directors or a majority of them determine.

The Port Authority shall take into consideration the existing methods and conditions of engagement of workmen employed in dock, riverside, and warehouse labour in connection with the Port of London, and shall, either by themselves or in co-operation with other bodies or persons, by establishing or maintaining or assisting in the establishment or maintenance of offices, waiting rooms, and employment registers, and by the collection and communication of information and otherwise, take such steps as they think best calculated to diminish the evils of casual employment, and to promote the more convenient and regular engagement of such workmen or any class thereof.

Subject to the provisions of this Act—

(*a*) every officer and servant of the Conservators, unless he is immediately before the appointed day employed solely or mainly in connection with the powers and duties of the Conservators not transferred by this Act to the Port Authority; and

(*b*) every officer and servant of the several dock companies; and

(*c*) every officer and servant of the Watermen's Company immediately before the appointed day employed solely or mainly in connection with the powers and duties of the Watermen's Company or the court of that company by this Act transferred to the Port Authority,

(all which officers and servants are in this Act referred to as existing officers and servants), shall, as from the appointed day, become an officer or servant of the Port Authority, and shall hold his office or situation by the same tenure and upon like terms and conditions (including all conditions regarding pension or other superannuation allowance), under the Port Authority as he would have held the same under the body from whom he is transferred if this Act had not been passed, and while performing the same duties shall receive not less salary, wages, or pay than he would have been entitled to if this Act had not been passed.

The Port Authority may abolish the office or situation of any existing officer or servant which they deem unnecessary, and every existing officer or servant whose office is so abolished or who otherwise suffers any direct pecuniary loss in consequence of this Act, shall be entitled to be paid by the Port Authority compensation for such pecuniary loss.

The financial clauses of the Bill may be summarized as follows:—

The stock issued to the transferred companies will be of two classes, A and B. The "A" stock will bear interest at 3 per cent., and the "B" stock at 4 per cent., and the "A" stock will be a prior stock both as to interest and capital. The largest company is, of course, the London and India Company, the present capital of which is £365,650 mortgage debentures, £2,805,291 3 per cent. "A" debenture stock, £3,259,254 3 per cent. "B" debenture stock, £1,814,331 3 per cent. "C" debenture stock, £1,986,423 4 per cent. preference non-cumulative stock, £1,438,723 4 per cent. non-cumulative "B" preference stock, £2,866,548 4 per cent. preferred ordinary stock, and £4,802,855 4 per cent. deferred ordinary stock.

The nominal fixed capital issued by the three companies at the end of 1907 was £23,702,686, and the Port stocks to be issued for this capital are—

In "A" Stock (3 per cent.)	£9,152,152
In "B" Stock (4 per cent.)	£13,210,824

The annual interest charges falling on the Port Authority in respect of these issues amount to £802,998.

Thames Steamboats

The London County Council inaugurated a service of thirty steamboats on the Thames in June, 1905, and from that date until October 2nd, 1905, the number of passengers carried was 7,390,473. On October 2nd, 1906, the service was suspended for the winter, being resumed on May 15th, 1907. From then until October 31st, 1907, when the boats ceased running, 2,392,643 passengers were carried. On February 18th, 1908, the Council decided to give authority for negotiations to be opened for the sale or chartering of its steamboats. Thus it will be seen that, as the position at present stands (November, 1908), the County Council have abandoned all present intention of continuing the service.

Congested Traffic

In view of the ever-increasing dangers and difficulties occasioned by the enormous growth of vehicular and pedestrian traffic in the Metropolis, many suggestions of reform in various directions have been advanced in recent years, but effective remedies have not been forthcoming in any successful measure. The narrowness and inadequacy of a large number of London thoroughfares to cope with conditions undreamt of when the city was laid out, is of course the most fruitful, as it is one of the most difficult, evils to remedy, and motor traction has added greatly to the dangers attendant upon swift movement in the narrow, crowded streets. The enormous extension of the London County Council's system of tramways has, doubtless, been of great benefit to the working classes, and has perhaps done much to lessen the evils of overcrowding; but, on the other hand, complaint is made by other road users against the practical monopoly of certain narrow arteries of traffic by double lines of rails, which besides constitute a fertile source of accidents.

London has received many and high encomiums on her fine tube and underground railways, which she in a great measure owes to Transatlantic genius and enterprise, and these are undoubtedly one of the most potent factors in alleviating the crush of workers that daily pours into the city from Greater London. Even here, however, there exists much need for reform, particularly towards obviating overcrowding, which at certain periods of the day on the tube railways prevails to a considerable extent. Again, whereas the London County Council, exercising its influence over the Metropolitan and the extra-Metropolitan districts, has spent large sums of money in widening streets, and thus helping traffic generally, the City itself—with all its financial resources—has done little to expedite traffic within its limits. The nature of vehicular traffic varies at different points, but it has been estimated that sixty per cent. of the vehicular traffic of London is made up of omnibuses and hackney carriages. At places of great congestion, the vast volume of traffic which pours through the thoroughfares of London is reduced to a walking pace, the rate of movement being set by the slowest vehicles. The burden of delay falls on all passengers, but presses most heavily on the professional and working classes, and especially on those who have to proceed a considerable distance to their work or business every day.

The question of cheap and rapid communication, as it affects the housing of the working classes, was dealt with under one of the heads of the report issued by the Royal Commission on London Traffic in 1905. Illustration was given therein of the loss incurred by the London County Council in re-housing the working-classes in the central portions of London, and the report stated that the evidence before the Commission appeared to clearly establish the fact "that the price of land in the central districts of London makes it impossible to re-house the working classes within those districts at rents which they can afford to pay without a heavy loss to those who undertake the re-housing. Also that the price of land a few miles out is still sufficiently low to admit of re-housing, without loss, at rents which the tenants can afford to pay." The solution lies, therefore, in providing the means to enable workmen to get into and out of London quickly and cheaply. Experience, too, has shown that, since a large proportion of workers in the overcrowded parts of the City do not need to live near their work, the population readily avail themselves of facilities to live outside of London. It is emphatically pointed out in the Report of the Commission that "the magnitude of the population of London, and the extent of the area over which the

population is spread, make the problem of locomotion specially important for London, and if the standard of movement cannot be raised to the level attained elsewhere, London must fall behind in competition with other cities, and the life and growth of the Metropolis will be slowly, but not the less surely, strangled, by the choking of the great arteries of traffic." They suggest that, so far as practicable, a preference should be given to such street improvements as are indispensable for the development of a complete system of tramways throughout London. In further discussing the position the report continues :—

The Difficulty

"The chief difficulty that stands in the way of improving the means of locomotion in London is the narrowness of the streets, and the fact that they were not originally laid out on any general plan. If the streets were of sufficient width, and had been laid out on a regular plan, the congestion of vehicular traffic would practically disappear; the long distance traffic could be provided for by shallow underground railways at a cost which would not be prohibitive; and a complete system of surface tramways could be laid down, which would carry the short-distance and miscellaneous passenger traffic of London cheaply and quickly.

"The present unsatisfactory conditions are largely due to the fact that there did not exist in the past any municipal or other authority having jurisdiction over the whole area, and possessed of sufficient power and resources to enable it to deal satisfactorily with the problem of locomotion, and the other questions allied thereto.

"The London County Council, since it was established in 1889, has either carried out, or is engaged in carrying out, street improvements, estimated to cost £11,946,007 gross, with 'recoupment' amounting to £5,812,878, the net cost being £6,133,129. Of the works undertaken by the London County Council, by far the most important is the new street from Holborn to the Strand (Kingsway), the gross cost of which is estimated at £4,866,000, and the net cost at £774,200.

"The difficulty is simply one of money. There can be no doubt that the cost of all improvements in London must be very heavy, even where land is comparatively cheap; in some districts, where the value of land is enormous, the cost is almost prohibitive. Hitherto, railway improvements have been effected by private enterprise in the expectation of a commercial profit. Tramways have been constructed both by municipal and by private enterprise, also in the expectation of profit; but the burden of street improvements of late years has fallen almost wholly upon the rates, and, however great the indirect advantages, this class of work cannot show any direct pecuniary return. We have been informed by the London County Council that, although the traffic requirements of London in respect of widening and opening streets have not been nearly met, the existing charge is as high as the ratepayers can bear.

"We recommend that the Building Laws, and bye-laws made thereunder, in 'Greater London,' outside the Administrative County of London, should, as far as practicable, be made uniform; that the power to define frontages should be given to all local authorities; and that new streets or roads should not be taken over by the local authorities until sufficient provision has been made for main roads.

"As no practicable improvement of the streets, that can be carried out for many years, will completely remove the congestion of street traffic, special attention should be given to: (1) Improved regulations for traffic; (2) The avoidance of certain oversights or defects in the construction and maintenance of the streets, the removal of fixed obstructions from them in certain cases, and the control, in the future, of the erection of such obstructions; (3) The introduction of a system for minimizing the evils caused by the breaking up of the streets by persons and companies having statutory authority to do so; (4) Regulation of the use of the streets by costermongers and itinerant vendors; (5) The removal of special obstructions to traffic."

Motor Traffic

In June of 1908 the question of regulating motor traffic in the City of London was discussed by a large meeting of influential business men, which was held at the Mansion House, on the invitation of the Lord Mayor, on the 22nd of the month. A resolution was passed urging upon the Government the necessity of providing the police authorities with such legislative powers as would enable them to regulate the construction and use of motor vehicles. The existing powers of the police for controlling such traffic were considered inadequate, and it was further suggested that the time had arrived when a Central Traffic Board should be formed. A deputation was also arranged to wait upon the Home Secretary, the President of the Local Government Board, and the President of the Board of Trade with reference to motor-omnibus and traction-engine traffic throughout the Metropolis. In consequence of the numerous representations made both in Parliament and elsewhere respecting the danger and annoyance not infrequently caused by the driving of motor-cars, the Local Government Board on September 17th, 1908, issued a circular to county councils and town councils of boroughs with a population of over ten thousand respecting the Motor-car Acts of 1896 and 1903.

It stated that many of the representations which had reached the Board suggested that further legislative restrictions should be imposed on motor-cars, and before determining upon that question the Board thought it desirable to direct notice to the provisions of the existing laws which had a bearing upon the subject.

With regard to the provisions dealing with reckless driving the only question to be considered in any particular case was whether in the circumstances the speed or manner of driving constituted danger to the public. The Board thought that the regulations regarding the suspension of licences should be sufficient to prevent most of the evils of which complaint was made. What was wanted was that they should be carefully and systematically enforced in proper cases.

On the question of speed it had been widely recognized that motor-cars could often travel with safety at speeds exceeding ten miles an hour, but a reduced speed-limit was needed in some cases. The Board were willing to consider applications for the imposition of the lower speed-limit in places where it might properly be imposed.

Expressing a preference for motor traffic being regulated under the reckless driving section of the Act where that was possible, the circular added that the Board were convinced that a steady and systematic enforcement of that section by all the authorities concerned would prevent, if not entirely, at all events to a very large extent, the flagrant and in some instances wanton abuse of the highway by inconsiderate and reckless drivers.

At the same time, while motorists should be required to obey the law, it was of importance that the road authorities should use every effort to diminish the risk of accidents from a form of traffic the existence of which could not be ignored. Thus it appeared to the Board that where there were dangerous corners advantage should be taken of suitable opportunities to obtain their removal; that where practicable street corners in towns should be rounded; and that where street improvements or road widenings were contemplated which would have the effect of giving increased facilities for traffic, these should be undertaken as soon as possible.

A conference was held at Paris in October, 1908, to discuss the question of street traffic, and two delegates attended from the London County Council in order to gain whatever information might be likely to assist in any contemplated scheme of street improvement in the

Metropolis. Thereat (on October 15th, 1908), a majority of the two thousand delegates decided that apart from the ideal of specially constructed roads the most efficient dust-preventing material was that which resulted when tar was incorporated into the structure of the road. Whilst expressing approbation of the effectiveness of oils, fluid salts, and other compounds as dust-allayers, the frequency with which such had to be laid on roadways made the expense proportionately great as compared with the method of combining tar with road metal and material as above referred to.

Electricity Supply

Three Bills relating to electricity supply for London were considered during the early part of 1908 by a Select Committee of the House of Lords, under the chairmanship of Lord Cromer. These were promoted respectively by the London and District Company, by eight of the existing supply companies of London, and by the Westminster and Kensington group of electric supply companies. The first-named company is concerned with an area including the whole of the Administrative County of London, *i.e.* the boroughs over which the London County Council has jurisdiction, together with the City area. They asked for further powers to supply various authorities outside that area, as far east as Tilbury and Swanscombe, and extending west to Ealing and Kingston, north to Enfield, and south to Croydon. Their scheme, as submitted, was —(1) to supply in bulk to authorized undertakers, and to permit authorized undertakers to take supply from them; (2) to purchase existing undertakings; (3) to supply railways within or without the area; (4) to supply in areas where there is at present no authorized undertaking; (5) to go into the area of an authorized undertaker and, with the consent of the authorized undertaker, to supply a consumer there with energy if the demand exceeded a prescribed limit. Should the authorized undertaker refuse consent, the District Company asked to be allowed to submit the matter to arbitration; and if the authorized undertaker refused to supply as cheaply as the District Company, the Bill asked that the District Company might then supply.

The Committee passed, without alteration, the area in respect to which powers were asked for, but the company's proposal that twenty per cent. of the energy supplied to a power user might be applied for lighting purposes was altered, the percentage being reduced to fifteen. A simplification was made in the method of adjusting the relationship between the price to be charged per unit and the corresponding dividend, and it was agreed that they had established the substantial character of their initial financial support. The Committee, however, did not confirm the London County Council as the final purchasing authority. It would thus appear that the District Company may be bought out fifty-three years hence, or at the expiration of any subsequent period of ten years, at the then value of lands, buildings, and works; or upon special terms, in less than fifty-three years at the then value, plus an item for goodwill—but the actual purchasing authority is undefined. The company may not supply any power consumer in any district, except by consent of the authorized distributor. If, however, the authorized distributor does not supply at a less price, or at an equally favourable price, the District Company can, in the event of disagreement as to their right to supply, go to arbitration; and if the Board of Trade approve, the District Company can then supply. Assuming that within the London area the total power of all kinds used for machinery likely to be available for electrical driving is only about 103,000 horse-power, of which nearly half is already supplied by existing electrical companies, the District Company have to face the difficulty of finding unappropriated users for the sixty thousand kilowatts upon the supply of which they rely in order to proceed upon the estimated basis. The principal alteration made, however, concerns the terms of purchase. When the Bill was introduced it was given in evidence by the promoters that, in order to raise the money, investors had to be assured that their capital would be returned to them intact. The company, therefore, proposed that their undertaking should be purchased at the end of fifty-two years, on terms of repaying to them all capital properly expended, together with such a sum as would be required to make up the aggregate amount of dividends, paid to the date of purchase, to six per cent. per annum. On this footing the promoters pledged themselves to raise a certain amount of capital. The terms of purchase now, however, assimilate to some extent to those applicable to the existing London companies, only that whereas none of the London companies obtained a grant of more than forty-two years, the District Company have, with the consent of the London County Council, been granted a period of fifty-three years. Moreover, the District Company are authorized to pay interest out of capital, during construction, up to a maximum sum of £400,000, a concession never granted to existing companies, who have invariably been compelled to wait for profits to be earned before shareholders could secure dividends.

Linking up

The companies promoting the second Bill proposed to supply any authorized distributor of electrical energy within the Administrative County of London, and they asked for powers within an area which circles the county through Hendon, Walthamstow, Barking, Chislehurst, Croydon, and Richmond. As the more important of the eight companies have already six large stations in various parts of the area, they desired permission to link up between them. If so linked up they would have immediately available ten thousand kilowatts from spare plant, over and above their existing requirements. The Committee seriously modified this Bill by the rejection of the clause which was to enable the companies concerned to form a joint committee. They cannot, therefore, build a joint station, nor can they jointly own machinery in any one of the stations. It was decided also that they cannot supply authorized distributors other than themselves, nor local authorities, nor any distributor not mentioned in the schedule of their Bill. They are, further, precluded from supplying the Westminster Company, the Central Electric Company, and the Kensington and Knightsbridge Company. The Committee, however, agreed that, except for certain restrictions in regard to the supply of Victoria Dock in West Ham, and the West India Dock so far as related to Stepney, the eight companies should have powers to supply any railway, tramway, canal, or dock, within, or partly within and partly outside, the scheduled area.

Five companies are concerned in the third Bill, including the Central Electric Bulk Company, which was formed to supply the Westminster Company and the St. James's Company in bulk, and which has a generating station in Marylebone. They now take powers to link up with Wood Lane generating station—a joint power station, owned by the Notting Hill Electric Lighting Company and the Kensington and Knightsbridge Electric Lighting Company, and they also take powers to supply each other. The area concerned is chiefly residential, with comparatively small demand for electricity for power purposes. This Bill was allowed by the Committee to proceed on similar lines to those promoted by the eight companies.

The decisions of the Committee removed a restriction that had greatly hampered London electric supply companies, who, by the terms of their orders, were prohibited from associating with each other; and further good service was done in settling a doubt which existed as to whether any undertaking requiring electric energy for traction purposes could take a supply outside the area supplying it.

These Bills were down for further consideration in the House of Commons on July 30th, 1908, but only one was

dealt with, namely, the London and District Electricity Supply Bill, a common policy being applicable to the three from their inter-relation. The Bill passed its second reading and was sent to Committee. The Rt. Hon. Winston Churchill had intended to propose an instruction to the Committee to insert in the Bill a provision conferring purchasing powers on the London County Council, but this could not be taken owing to the hour. An instruction to this effect, however, was carried on October 19th.

Tramways

In a London County Council report issued August, 1908, the Highways Committee gave the following particulars regarding the position of the undertaking, as at March 31st, 1908 :—

Total capital expenditure	£8,414,590
Debt repaid :	
Out of revenue	819,376
From sale of materials, etc.	264,515
Debt outstanding	7,262,139

Receipts and working expenses for the year, in round figures—

	Electric traction.	Horse traction.	Total.
Total receipts	£1,274,660	£388,371	£1,663,031
Working expenses	724,381	445,734	1,170,115
Surplus on working			£492,916

Against this had to be set the following charges :—

Debt charges—		
Interest (gross)	£233,821	
Repayment	216,203	
		£450,024
Income-tax (after crediting £11,691 for tax retained from interest on debt)		3,309
Interest on purchase-money		423
Parliamentary expenses		2,350
Deficiency on Drake Buildings (rehousing obligation)		96
		£456,202
Less net interest on cash balances, etc. ..		8,692
		£447,510

Deducting this amount from the surplus of £492,916, there remained a net balance of £45,406.

Of the existing lines, nearly seventy miles are now under electric traction, the operating expenses in connection with this system being equivalent to 6·79*d.* a car-mile run, as compared with 7·06*d.* a car-mile in 1906–7, while the working expenses in connection with horse traction represented 10·73*d.* a car-mile run. The following are the details of the year's traffic :—

	Electric traction.	Horse traction.	Total.
Number of passengers ..	279,166,461	93,349,293	372,515,754
Number of car-miles run ..	25,591,028	9,970,161	35,561,189

It was proposed to seek Parliamentary powers in 1909 for the construction of further new tramways. Eight separate sections, having a total length of over seventeen miles, are to be constructed, at an aggregate cost of £403,430. The conduit system of electric traction will be adopted, save in the case of one or two sections, which will be constructed on the overhead system.

Powers are also to be sought in next year's Bill for the reconstruction, on the electric conduit system, of upwards of twelve miles of existing lines, at an estimated cost of £297,830.

The Tramways Department employs about 8200 persons on weekly or daily wages, and a large number on yearly salaries or fixed wages. The regulators are paid 42*s.* to 44*s.* weekly, and the rates of pay to motormen, car-drivers, and conductors are 5*s.* to 6*s.* 6*d.* per day. The district inspectors are paid 45*s.* per week; the ticket inspectors 42*s.* per week ; and so on.

Water Supply

The Metropolitan Water Board came into existence early in 1903, having been created by the Metropolis Water Act, December 18th, 1902, by an amalgamation of the various London Water Companies. The regulations under which water is supplied by the Board were brought into operation on April 1st, 1908, by the passing of the Metropolitan Water Board (Charges) Act in the previous year. Under these the rate of water for domestic purposes may never amount to more than five per cent. of the rateable value of the house. When a house, occupied for the purpose of a business or profession, is assessed at more than £300, and is not charged with the payment of Inhabited House Duty, a rebate of not less than twenty per cent., and not more than thirty per cent., of its water rate may be allowed by the Board under certain conditions. Water is supplied by meter at 11*d.* per thousand gallons for not more than fifty thousand gallons, down to 6¾*d.* per thousand for more than five million gallons. In his report on the condition of the Metropolitan water supply during the month of May, 1908, the Water Examiner appointed under the Metropolis Water Act, 1871, shows that for a population supplied in all districts of 6,991,164, the number of gallons per head per day consumed during the month was 32·13.

Works Department

The establishment of the Works Department of the London County Council originated in a crisis that arose between the Council and its contractors in 1892, when it was resolved at a meeting on November 22nd of that year, to form a Works Department on a permanent basis. The Department began work in February, 1893, the Works Committee consisting of eight members.

Contractors employed by the Council on works of construction or manufacture within a radius of twenty miles from Charing Cross were required to pay wages at rates not less, and to observe hours of labour not longer, than were for the time being recognized by associations of employers and trade unions and that were in practice obtained in London. With regard to labour employed outside that radius, the rates of wages and hours of labour recognized and in practice obtained in the district where the work was to be done were required to be observed. In the Council's Works Department no distinction was drawn in the employment of labour between union and non-union men.

The discontinuance of the Works Department of the Council was decided upon at the meeting of the Council on July 28th, 1908.

LONDON, CITY OF: The most important recent change in the administration of the City of London was its unification, which took place in April, 1908, under the "City of London (Union of Parishes) Act, 1907." By it the 112 parishes which existed within the square mile which comprises the City of London were amalgamated into one administrative area under the Lord Mayor and Corporation. Previously there had been a multiplicity of offices held under the separate system, and one of the principal achievements of the new enactment has been to greatly reduce the expenses of such separate parochial working, whilst in actual administration greater efficiency has been achieved by the centralization and amalgamation into "the parish of the City of London." The net expenses of the City administration for 1906 were £188,917.

LONDON MUNICIPAL SOCIETY, THE: Founded in 1894. Object: To fight Municipal Socialism, and generally to bring municipal and social questions under public consideration with a view to

sound administration and practical reforms. Official organ, *London Municipal Notes*, monthly, 2*d*. President, The Duke of Norfolk, E.M., K.G. *Secretary:* Mr. W. G. Towler, 11, Tothill Street, Westminster, London, S.W.

LONDON REFORM UNION: Founded in 1892. Object: (1) To encourage good citizenship among all who live or work in London, and to promote united action in furtherance of social reform and better municipal government; (2) To secure the adoption of progressive principles by all municipal bodies in and around London, etc. There are about one thousand members. Among the special efforts made by this influential organization may be mentioned those on behalf of the Milk Depôts Bill, Municipal Elections Corrupt Practices Bill, Women on Municipal Councils, and Citizen Sunday (October 27th, 1907), for which 521 ministers of all denominations intimated their intention of preaching special sermons. President, Earl Beauchamp, K.C.M.G. *Secretary:* Mr. F. W. Galton, Trafalgar Buildings, Charing Cross, London, W.C.

LONDON SCHOOLS DINNER ASSOCIATION: Founded in 1889. (Incorporating the Board School Children's Free Dinner Fund.) Object: To provide cheap or free meals for underfed children attending the elementary schools of London. *Secretary:* Mr. Arthur H. Ward, L.A.A., 32, John Street, Theobald's Road, London, W.C.

LUNACY, INCREASE OF: The sixty-second report, issued August 20th, 1908, by the Commissioners in Lunacy gives the number of insane persons known to be under control in England and Wales on January 1st, 1908, as 126,084, or 2096 more than on the same day of the previous year. This is well below the average increase for the previous ten years, which was 2411. Although this is so, however, the rate of increase per decade is very decided—

Year.	Number of insane.	Total increase on 1859 figures.
		Per cent.
1859	36,762	—
1869	53,177	44·6
1879	69,885	90·1
1889	84,340	129·4
1899	105,086	185·9

The increase in population between 1859 and 1899 was only 79·5.

Taking the yearly figures since 1898, the yearly percentage of increase is seen to be—

Year.	Number of insane.	Increase on previous year.	Increase on 1898 figures.
1898	101,972	—	—
1899	105,086	3·0	3·0
1900	106,611	1·4	4·5
1901	107,944	1·2	5·8
1902	110,713	2·6	8·5
1903	113,964	2·9	11·7
1904	117,199	2·8	14·9
1905	119,829	2·2	17·5
1906	121,979	1·8	19·6
1907	123,988	1·6	21·6
1908	126,084	1·7	23·7

Taking the cases for the last five years, an averaged analysis of causes reveals—

	Men.	Women.
Intemperance	2341	1004
Domestic trouble	384	956
Adverse circumstances ..	699	407
Mental anxiety and worry ..	572	638
Religious excitement	137	197
Love affairs	53	204
Fright	83	204
Sunstroke	118	8
Old age	815	988
Privation and starvation ..	119	96
Hereditary influence	2173	2908
Congenital defect	676	494
Over-exertion	47	26

There is little difference between the figures for single and married patients; see the following table of the yearly average of admissions :—

	Male.	Female.	Total.
Single	4854	4670	9524
Married	4772	4791	9563
Widowed	971	1733	2704
Unknown ..	84	30	114
Total	10,681	11,224	21,905

In five counties only are decreases on 1907 figures shown, the greatest being Devon which has sixty-four less than in 1907. In Oxford the figures are exactly as in 1907. Middlesex shows the largest increase, *i.e.* 155 more than in 1907. The figures for London are 1907—25,279, 1908—25,689, making an increase of 510. The figures for large provincial cities are—

	1907.	1908.	Increase.
Birmingham ..	1810	1867	57
Leeds	1198	1210	12
Liverpool	3088	3134	46
Manchester ..	2070	2113	43

The Royal Commission

On July 31st, 1908, the Royal Commission on the Care and Control of the Feeble-minded, appointed in 1904, issued a blue book containing the first part of their report. It embodied recommendations, one of the more important of which reads—

"That the State should have authority to segregate and to detain mentally defective persons under proper conditions and limitations, and on their behalf to compel the payment of contributions from relations who are able to pay for their support; or should itself provide such care and accommodation as may be necessary, either directly or through the local authority.

"This, subject to many variations and adjustments, is an extension to the whole class of the mentally defective of advantages now given to lunatics and idiots only."

They also reported—

"We find lunatic asylums crowded with patients who do not require the careful hospital treatment that

well-equipped asylums now afford, and who might be treated in many other ways more economically, and as efficiently.

"We find also at large in the population many mentally defective persons—adults, young persons, and children—who are incapable of self-control, and who are therefore exposed to constant moral danger themselves, and become the source of lasting injury to the community."

For England and Ireland important proposals were made for dealing with criminal mentally defective persons, the chief being that upon conviction the Court, instead of sending the offender to prison, may accept recognizances on his behalf, on condition that he remains under the control of the Statutory Committee through the medium of which the Board of Control operates, until discharged by that committee.

The number of lunatic asylums in the United Kingdom is: England 112, Scotland 30, Ireland 24.

The average cost of maintenance per head during the year ending March 31st, 1907, according to the Commissioners' return issued August 1908, exclusive of repairs to buildings, was 10*s.* 0¾*d.*, a reduction of 1⅜*d.* per head on the previous year and lower than any financial year since 1902.

Total cost of maintenance in county, district, and county borough asylums for the twelve months ending March 31st, 1907, was £2,465,977, and the cost of repairs to buildings for the same period £588,107. Up to January, 1908, the land occupied by asylums totalled 17,831 acres, which was acquired at a cost of £1,635,232, whilst the original buildings and additions to above date showed an aggregate cost (exclusive of repairs) of £20,418,846.

M

MENDICITY SOCIETY, LONDON: Founded in 1818. Object: To suppress street begging and to investigate the *bona fides* of begging letters. President, Mr. Robert Pierpoint. *Secretary:* Mr. W. Fitzgerald Arbuthnot, 9, Red Lion Square, Holborn, London, W.C.

METALLURGISTS' INTERNATIONAL FEDERATION (BRITISH SECTION): In all twelve nationalities are associated with this Federation, the total membership being 600,000, of whom 130,000 are embraced in the British section. The headquarters of the general body is at Rotestrasse 16, Stuttgart, Germany. *General Secretary:* Herr Alexander Schlicke. In the British section, the President is Mr. John Hodge, M.P. *Secretary*, Mr. Chas. Hobson, Alpine Road, Sheffield.

METRIC SYSTEM: This system, which was invented in 1793, and which is in practical use in France, Germany, and other countries on the Continent, has many advocates in the United Kingdom. They claim that we lose business because we do not manufacture and sell in terms of the metric system, and argue that to avoid the trouble, confusion, and expense of having one system of weights and measures for our home trade and another for our foreign trade, we should adopt the metric weights and measures for all purposes, and so place ourselves on an equal footing with our competitors.

In 1895 a select committee of the House of Commons received a large amount of evidence on the subject and reported as follows: (*a*) That the metric system of weights and measures be at once legalized for all purposes; (*b*) That after a lapse of two years the metric system be rendered compulsory by Act of Parliament; (*c*) That the metric system of weights and measures be taught in all public elementary schools as a necessary and integral part of arithmetic, and that decimals be introduced at an earlier period of the school curriculum than is the case at present.

A Bill advocating the metric system was brought before the House of Commons in 1904, but did not pass. The system in brief works out as follows—Length: Metre (m.) divided into 100 centimetres (cm.), or 1000 millimetres (mm.), kilometre (km.) = 1000 metres. The metre is the fundamental unit of all metric weights and measures. An exact official standard metre is in every civilized country. Surface: Square metre divided into square centimetres. Bulk: Cubic metre divided into cubic centimetres. Capacity: Litre (l.) divided into 1000 cubic centimetres. Weight: Kilogram (kg.) divided into 1000 grams. It is the fundamental unit of weight, and approximately it is the weight of one litre of distilled water at its greatest density.

The late Lord Kelvin, Col. Sir Howard Vincent, Rt. Hon. Sir Horace Plunkett, Lord Charles Beresford and others have expressed opinions as to the desirability of the system coming into general use. The Decimal Association of London are its special exponents. The weight of public opinion in the United Kingdom, however, is at present unfavourable to the system, the legitimate argument being that it would be too huge a task to uproot the existing system of British weights and measures, and that the complexity would not be appreciably relieved by adopting metricism.

METROPOLITAN WATER BOARD: (See under LONDON.)

MINIMUM WAGE: (See under SWEATING, and WAGES BOARDS.)

MORAL EDUCATION CONGRESS, INTERNATIONAL: Object: To improve the moral education offered in schools. The first session was held at the University of London in September, 1908. *General Secretary:* Mr. Gustav Spiller, 13, Buckingham Street, Strand, London, W.C. (See EDUCATION, MORAL.)

MORAL INSTRUCTION LEAGUE, THE: Founded in 1897. Object: To urge the vital importance of efficient moral and civic education in schools. There are about seven hundred members, and the League has succeeded in influencing the Board of Education to make some provision for moral instruction in all the public elementary schools of England and Wales; has influenced more than fifty local education authorities to provide for systematic moral instruction in their schools; publishes moral-lesson text-books, graduated syllabuses of moral and civic instruction for elementary and secondary schools; and is now exercising considerable influence in other countries. President, Prof. J. S. Mackenzie, Litt.D. *Secretary:* Mr. Harrold Johnson, 6, York Buildings, Adelphi, London, W.C.

MUNICIPAL CORPORATIONS, THE ASSOCIATION OF: Founded in 1873. Object: By complete organization, more effectually to watch over and protect the interests, rights, and privileges of municipal corporations, as they may be affected by Public Bill Legislation, or by Private Bill Legislation of general application to boroughs; and, in other respects, to take

action in relation to any other subjects in which municipal corporations generally may be interested. President, Mr. J. S. Harmood-Banner, M.P. *Secretary:* Mr. A. Goring Pritchard, 9, Bridge Street, Westminster, London, S.W.

MUNICIPALISM: The particulars and statistics given under MUNICIPAL OWNERSHIP and kindred headings deal in some fulness with existing forms of municipal enterprise. According to the *Municipal Year Book*, 1908, 256,258 persons are employed by municipalities in England and Wales, *i.e.*—

Councils included in Local Government Board Return.	Number of persons employed on the clerical staff.	Other employees.	Total number of persons employed.
London County Council ..	1,829	37,920	39,749
Councils of Metropolitan Boroughs	1,762	19,739	21,501
Councils of County Boroughs	11,619	183,389	195,008
Totals ..	15,210	241,048	256,258

The chief channels of municipal enterprise are markets, gas, electricity, water, tramways, estates. In most towns a profit accrues, and the rates are relieved accordingly, but in some thirty towns the estimates for 1907–08 calculate on a loss. Thus, during 1907–08 an expert estimate showed £1,113,732 profit on municipal undertakings, and a loss of £165,731 in the thirty above mentioned. An exhaustive analysis of municipal trading, with tabulations of profits, etc., is given in *Fabian Tract* 138, issued in July, 1908.

Mr. Bernard Shaw

In addition to the authorities already quoted, Mr. G. Bernard Shaw, in his 1908 work on *The Commonsense of Municipal Trading*, asserts that "municipal trading is not an evil to be staved off by any possible means, but a highly desirable and beneficial extension of civilization.

"This is the central commercial fact of the whole question. The shopkeeper, by municipal trading, can get his light (to quote that as an example) for the current cost of production plus a rate of interest which includes no insurance against risk of loss, because the security, in spite of all theoretical demonstrations to the contrary, is treated by the investing public and by the law of trusteeship as practically perfect. Any profit that may arise through accidental overcharge returns to the ratepayer in relief of rates or in public service of some kind.

"The moment this economic situation is grasped, the successes of municipal trading become intelligible. As far as their legal powers have gone, municipalities have always traded, and will always trade, to the utmost limits of the business capacity and public spirit of their members. The moment public spirit and business capacity meet on a municipality you get an irresistible development of municipal activity. Operations in land like those effected by the Corporation of Birmingham in Mr. Chamberlain's time, and by the London County Council in our own, are taken in hand; and the town supplies of water, of light, of tramways, and even of dwellings, are conquered from competitive commerce by civic co-operation. And there is no arguing with the practical results. A man who has just paid a halfpenny for a ride in a municipal tramcar under commercial management would have had to pay a penny or twopence. The importance of management as a factor in industrial success cannot easily be exaggerated. A municipality can always get an efficient official more cheaply than a company can.

"On the whole, then, when the directors of a joint stock company on the one hand, and the representatives of the ratepayers on the other, come into the market to engage an executive staff, the municipality has the advantage of its competitor. It can get its management cheaper as certainly as it can get its capital cheaper. In short, all such public business of sufficient magnitude to keep the necessary plant working full time until it has paid for itself, can, when it is purely local, be done more cheaply by municipal than by private enterprise."

MUNICIPAL LODGING HOUSES: (See in connection with ROWTON HOUSES.)

N

NATIONAL FREE LABOUR ASSOCIATION: Founded in 1893 to maintain freedom of labour, based on the right possessed by every man to pursue his trade or employment without dictation, molestation, or obstruction. To afford legal and other protection to its members in the assertion and enjoyment of that right. To provide means for the free registration of the unemployed of all trades and industries, whereby the wants of employers requiring labour may be met, and for the more convenient and ready selection of workers when required, thus bringing labour and capital together in the free and unrestricted exercise of their individual rights as employer and employed. Membership, 680,000. Official organ, *Free Labour Press*, weekly, 1*d*. President, Mr. John Chandler. *General Secretary:* Mr. William Collison, 5, Farringdon Avenue, London, E.C.

NATIONAL HYGIENIC LEAGUE: Founded in 1903. Objects: (1) The suppression of smoking by juveniles; (2) The securing of a weekly rest day. President, Lord Charles Beresford, K.C.B. *Secretary:* Mr. Charles Ware, 22, Great Quebec Street, London, W.

NATIONALIZATION OF RAILWAYS: (See under RAILWAY PROBLEMS.)

NATIONAL VOLUNTEER MOVEMENT: (See under INDIA.)

NATIVE RACES, AND THE LIQUOR TRAFFIC UNITED COMMITTEE: Founded in 1887. Object: To call the attention of Government to every opportunity of advancing the welfare of the subject and aboriginal races by (*a*) prohibiting, or failing that, (*b*) by checking the liquor traffic among them. Since the formation of the Committee, legislation for the protection of native races from the liquor traffic has been introduced in many different parts of the world. In large areas of the African continent prohibition of the sale of liquor to natives is carried out, and the international agreement which was secured by the Brussels Act of 1890, and revised in 1899, has been of the greatest benefit to the races of Central Africa. President, The Duke of Westminster. *Secretary:* Mr. L. H. Nott, 139, Palace Chambers, Westminster, London, S.W.

NAVY, BRITISH, AND COMPARISONS: The reports issued by the Admiralty in August, 1908, show that Great Britain still maintains a good lead, as the following table indicates:—

	Battleships less than twenty-five years old.	Armoured cruisers less than twenty years old.	Completed destroyers.	Destroyers building.
Great Britain ..	57	34	142	12
United States..	25	13	20	5
France ..	21	19	48	27
Germany ..	22	8	61	12
Japan	11	11	54	4

In addition Great Britain has thirteen torpedo-boats, formerly designated coastal destroyers, completed and twenty-three building; while Germany has ten divisional torpedo-boats completed.

Comparisons of expenditure for the past and future are given below, together with amounts voted for similar periods—

TOTAL NAVAL EXPENDITURE.

	1906-07.	1907-08.	1908-09.
	£	£	£
Great Britain	31,472,087	31,419,500*	32,319,500*
France ..	13,003,238	12,486,793	12,797,308
Russia ..	12,490,444	8,850,240†	9,833,915
Germany ..	12,005,871	13,623,924*	16,596,561*
Italy	5,322,154	5,661,822†	6,266,193†
United States	21,358,199	21,260,732	25,833,217‡
Japan	3,952,311	8,248,222	8,094,884

* Estimate. † Gross. ‡ Voted.

In the case of Russia, special credits were voted as follows and are not included in the figures given above: 1904-05-06-07, voluntary war contribution of £1,800,000, spent wholly in new construction and armaments. Russia's naval expenditure for 1908 was increased by £350,625 by supplementary estimates passed in July of that year. No part of this sum was for new construction.

AMOUNT VOTED FOR CONSTRUCTION.

	1906-07.	1907-08.	1908-09.
	£	£	£
Great Britain	10,859,500*	9,227,000*	8,660,202
France ..	5,702,267	5,132,494	5,315,790
Russia ..	4,576,583	2,846,268	2,703,721
Germany ..	5,342,466	6,285,225	8,366,438
Italy	1,362,207	1,398,111	1,866,358
United States	8,600,774	6,783,705	7,798,815
Japan ..	752,595	3,233,298	2,967,918

* In these years the amounts actually expended were £10,486,397 and £9,166,876 respectively.

It is interesting to know that the British Naval outlay reached its highest point in 1904-5, when £38,859,000 was voted.

The aggregate tonnage of new warships of every kind in construction during the periods noted comes to—

	1906-07.	1907-08.	1908-09.
	Tons.	Tons.	Tons.
Great Britain ..	83,260	119,637	74,712

Germany	53,180	33,985	—
Italy	16,016	19,510	—
United States ..	37,283	20,633	—
Japan	39,870	56,450	—

New Ships

The four new battleships and three new armoured cruisers which, with other war vessels, are almost ready (October, 1908) to be placed on service, will add materially to British naval strength. The new battleships are: *Bellerophon*, 18,600 tons; *Temeraire*, 18,600 tons; *Superb*, 18,600 tons, each with ten 12-inch guns; *Lord Nelson*, 16,500 tons, with four 12-inch, and ten 9·2-inch guns. All the first three ships are capable of steaming twenty-one knots, and will carry no gun (other than anti-torpedo craft guns) smaller than the 9·2-inch weapon.

The three cruisers are: *Invincible*, 17,250 tons; *Inflexible*, 17,250 tons, with eight 12-inch guns each; *Defence*, 14,600 tons, with four 9·2-inch and ten 7·5-inch guns. Of the three vessels named above, the first two have designed speeds of twenty-five knots, and the third twenty-three knots. Any one of them is equal to any battleship which Germany has in commission. The *Deutschland*, flagship of the German High Sea Fleet, is armed with four 11-inch and fourteen 6·7-inch guns, and has an extreme speed of nineteen knots. The Cruiser Squadron is also remarkable in having ships armed with 12-inch guns (no foreign completed cruiser outside the Japanese Navy carrying anything larger than the 10-inch gun) and in having no fighting gun smaller than the 7·5-inch.

The two-power standard is thus more than maintained, but the fact that the German Navy Act, passed in the spring of 1908, provides for ten vessels of the *Dreadnought* type being laid down in 1908, and four more during 1909, will obviously affect the balance. To maintain supremacy it is asserted in well-informed circles that in the autumn of 1908 "proposals had been put forward by financiers of the highest standing, who undertook to find £100,000,000 on nominal terms, so as to meet the necessities of the fleet in the next few years without disorganizing the annual budgets or casting a heavy burden on the present generation."

For earlier statistics, see NAVAL POWERS, page 817.

NEW REFORM CLUB, POLITICAL COMMITTEE: Object: To push a Liberal propaganda. Membership, 422. An important series of conferences to discuss the finance of Social Reform was arranged for the autumn of 1908. Chairman, Lord Weardale. *Secretary:* Mr. Holford Knight, 10, Adelphi Terrace, London, W.C.

NON-SMOKERS, THE BRITISH UNION OF: Founded in 1889, and earlier work incorporated with it. Affiliated with it is the British Lads' Anti-Smoking Union. Object: To educate on the harmful effects of tobacco using, and to agitate for legislation against juvenile smoking. Official organ, *The Anti-Tobacco Journal*, monthly, 1d. President, Deputy Surgeon-General Partridge. *Hon. Secretary:* Mr. G. W. L. Barraclough, F.R.H.S., Floraville, Malmesbury Road, Woodford, London, N.E.

O

OLD-AGE PENSIONS: By the Act of August, 1908, as brought in by the Liberal Government, and fathered by the Prime Minister, the Rt. Hon. H. H. Asquith, and in force from January 1st, 1909, persons are eligible for old-age pensions in the United Kingdom, provided the statutory conditions are complied with:—

(1) The person must have attained the age of seventy;
(2) The person must satisfy the pension authorities that for at least twenty years up to the date of the receipt of any sum on account of a pension he has been a British subject, and has had his residence, as defined by regulations under this Act, in the United Kingdom;
(3) The person must satisfy the pension authorities that his yearly means as calculated under this Act do not exceed thirty-one pounds ten shillings.

Between the maximum thus indicated and an annual income of £21, the Act fixes a sliding scale—

Means of pensioner.	Rate of pension per week.
	s. d.
Where the yearly means of the pensioner as calculated under this Act—	
Do not exceed £21	5 0
Exceed £21, but do not exceed £23 12s. 6d.	4 0
Exceed £23 12s. 6d., but do not exceed £26 5s.	3 0
Exceed £26 5s., but do not exceed £28 17s. 6d.	2 0
Exceed £28 17s. 6d., but do not exceed £31 10s.	1 0

A point in the Act which has been generally commended is "The receipt of an old-age pension under this Act shall not deprive the pensioner of any franchise, right, or privilege, or subject him to any disability." The Act provides for the pension being payable weekly in advance, through the post-office. There are disqualifications, however, the principal one being the receipt of any poor relief at any time from January 1st, 1908, with the exception of any medical or surgical assistance (including food or comforts) supplied by or on the recommendation of a medical officer. This disqualification may be removed in 1910. Moreover, a person otherwise qualified cannot secure a pension if he has habitually failed to work. A person will not, however, be disqualified if he has "continuously for ten years up to attaining the age of sixty, by means of payments to friendly, provident, or other societies, or trade unions, or other approved steps, made such provision against old age, sickness, infirmity, or want or loss of employment as is recognized as proper provision for the purpose by the regulations."

Disqualifications

Claims are made through the local postmaster, and considered by a local pension officer and a committee appointed locally. A computation of the allowances due at January 1st, 1909, gives an approximation of a million persons eligible.

The earlier political history of old-age pensions is told on page 849. Statistics issued March, 1907, of the working of pensions in the Colonies, show that in New Zealand 22,000 pensioners over sixty-five years of age receive £325,000 per annum between them, the maximum being recently altered from 7s. to 10s. per week. The estimate for 1908 shows an advance of £10,000, *i.e.* £335,000. New South Wales divides £508,000 per annum among 22,000 pensioners, and Victoria £205,000 among 11,452 pensioners. An estimate made in Melbourne on June 1st, 1908, forecasted the cost of the Commonwealth pension scheme of giving 10s. per week to all indigent persons over sixty-five years of age as amounting to £1,800,000 yearly.

In the Colonies

The feature of the English Act is that it is non-contributory, *i.e.* all the sum is raised from the rates. In distinction to this is the report from Italy, where a tentative contributory scheme (see page 849) is in operation under the name of the National Fund. Signor Luig Luzzatti, in a lecture given in Rome on June 1st, 1908, admitted that the contributory scheme was a failure. Instead of the six or seven million workmen who were expected to insure themselves, only 251,000 subscribed, and one-fourth of these allowed their payments to lapse.

The Chancellor of the Exchequer, Rt. Hon. D. Lloyd-George, spent his holiday in Germany in August, 1908, in order to obtain a more efficient understanding of the practical working of old-age pension schemes, which for twenty years have been in successful operation in the Fatherland. In an interview on August 27th, on returning to England, he described its working as "the finest system in the world." To further quote him: "It is a far more gigantic enterprise than I had ever expected to find. It is the most wonderful piece of organization that I have ever witnessed. I have interviewed employers and workmen, and I have seen the workings of the system in the central offices of the Provinces, and finally, in the great central Imperial office at Berlin. It covers the cases of sickness, old age, accident and invalidity. The scope of it is shown by the fact that in the present year £34,000,000 will be raised for all these purposes in Germany. The Government are now adding clerks and widows; that in all will bring it up to £53,000,000, contributed by the nation itself for its own insurance. The sum contributed by the State amounts to a little more than the working expenses. Both Socialists and trade union leaders seem to me to be perfectly satisfied with its working. I pressed them for suggestions for improvement, and the chief suggestion they had to make was that the pension was too small. It certainly is too small, and in the case of sick insurance—to which the State contributes nothing, but which is a compulsory scheme forced upon all employers and workmen—there is a large growth of collateral organizations for supplementing the pension. Trade union leaders, I found, were not in any case opposed on principle to the contributory system. They were all full of enthusiasm as to the influence of the whole system in raising the general standard of life and comfort in Germany. The employers seem to have been at first very dissatisfied; but now they are highly pleased with it. One of the most remarkable parts of the system is that the funds are invested by the State, partly in workmen's dwellings and in sanatoria, as a means of lowering the final expenditure; for it obviously becomes the interest of all parties concerned that the whole health of the country should be raised."

In Germany

PARKS AND OPEN SPACES: (See under LONDON.)

PAROCHIAL RELIEF: (See under POOR LAWS.)

PATENTS ACT, 1907: The new Patents and Designs Act came into force on August 28th, 1908, as framed by the Rt. Hon. D. Lloyd-George, Chancellor of the Exchequer. Its provisions are contained in the enactment officially called "Patents and Designs Act, 1907," but a time limit was fixed which allowed arrangements by foreign firms to be made in order that they might comply with the conditions of the Act, and this limit did not mature until the date above mentioned. The minor provisions which came into force on January 1st, 1908, are of general application, but the important feature of the Bill is in clause 27 of section 1, which stipulates that "At any time not less than four years after the date of a patent, and not less than one year after the passing of this Act, any person may apply to the Comptroller (of the Patent Office) for the revocation of the patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom."

According to this clause, holders of foreign patents operating in England have three courses open to them: (1) They may take no action at all, thereby permitting any British firm to apply at once for the revocation of their patent, and commence the manufacture of the goods themselves by British labour and on British soil; (2) They may come to an arrangement with some British firm for the manufacture of their goods under a royalty in the United Kingdom; (3) They may at once erect a factory in this country and manufacture in it all their goods intended for the British market.

The enforcement of the Act in its entirety is expected to have the effect of accentuating the trade of the country, insomuch as an enormous number of articles hitherto made abroad and sold here, must now be manufactured within the United Kingdom, either entirely or in part. A large number of foreign firms affected by the maturing of the Act have factories in the course of erection on sites in various parts of England. To quote the London *Daily Mail* of August 28th, 1908: "Thirty great foreign firms now have factories completed or under construction, in this country. In three years' time the number should be increased to quite three thousand. About twenty of the concerns erecting their works in England are of German origin. The remainder are American. The principal things which the German firms will make in this country are: Aniline dyes, pottery, gasmaking plant, rifles, patent foods, electric appliances, furnaces, sanitary appliances. The American goods which are to be manufactured in England are chiefly confined to typewriters, safety razors, phonograph records, shoes, telephones, and wire roofing. In one district of England alone it was estimated recently that £150,000 of capital had been sunk in sites for factories by one or two foreign firms, and that employment would be forthcoming for over two thousand men."

The Act will have the result, in the opinion of no less an authority than Sir Alfred Jones, of securing the investment of some £25,000,000 of foreign capital in England, and will prove to be an important factor in the solving of the unemployed problem. In this connection, it is important to note the large number of foreign patents which are annually registered at the Patent Office. The last report of the Comptroller-General gives the figures thus:

	1906.	1907.
Germany	2608 ..	2901
United States	2792 ..	2595
France	753 ..	769
Austria-Hungary	299 ..	257
Switzerland	190 ..	178
Sweden	138 ..	105
Italy	112 ..	111

PAUPERISM: (See under POOR LAWS.)

PEABODY DONATION FUND: Founded in 1862 by the late Mr. George Peabody of the U.S.A. (*q.v.*), whose total donations amounted to £500,000. Object: To ameliorate the condition of the poor and needy of London, and to promote their comfort and happiness. As shown by statistics up to September, 1908, the Governors had provided for the artisan and labouring poor of London, 12,913 rooms, including those occupied by the superintendents and porters, besides bathrooms, laundries, and lavatories. These rooms comprise 5586 separate dwellings, viz. 199 cottages of five rooms, 105 tenements of four rooms, 1833 of three rooms, 2550 of two rooms, and 899 of one room. Chairman, the Duke of Devonshire, K.G. *Secretary:* Mr. F. B. Crouch, 64, Queen Street, London, E.C.

PEACE AND ARBITRATION SOCIETY, WEST OF SCOTLAND: Founded in 1888. Membership, 205. President, Rev. James Barr, B.D. *Secretary:* Mr. Wm. J. Begg, 150, Hope Street, Glasgow.

PEACE COMMITTEE OF THE SOCIETY OF FRIENDS: (See FRIENDS, PEACE COMMITTEE OF THE SOCIETY OF.)

PEACE, UNIVERSAL: During recent years the efforts of many kings and other rulers have been directed towards the attainment of a world-peace and systems of arbitration. Since the Peace Rescript of the Tsar, much has been done—see PEACE CONGRESS references. How much is owed to Great Britain for the promotion of peace may not be generally recognized as it might be. There is little doubt that in the early training of the Tsar he was imbued by both his mother and his father with a hatred of war. That the thought of universal peace was not a mere passing fancy is seen by the fact that only four years after his accession to the throne, Nicholas II. issued his famous Peace Rescript, the text of which as handed by Count Muravieff, on August 24th, 1898, to all the foreign representatives accredited to the Court of St. Petersburg, was as follows:—

The Tsar's Rescript

"The maintenance of general peace and a possible reduction of the excessive armaments which weigh upon all nations present themselves in the existing condition of the whole world, as the ideal towards which the endeavours of all Governments should be directed.

"The humanitarian and magnanimous ideas of his Majesty the Emperor have been won over to this view. In conviction that this lofty aim is in conformity with the most essential interests and the legitimate views of all Powers, the Imperial Government thinks that the present moment would be very favourable to seeking, by means of international discussion, the most effectual means of assuring to all peoples the benefits of a real and durable peace, and, above all, of putting an end to the progressive development of the present armaments.

"In the course of the last twenty years the longings for a general appeasement have grown especially pronounced in the consciences of civilized nations. The preservation of peace has been put forward as the object of international policy; it is in its name that great States have concluded between themselves powerful alliances; it is the better to guarantee peace that they have developed in proportions hitherto unprecedented their military forces, and still continue to increase them without shrinking from any sacrifice.

"All these efforts, nevertheless, have not been able to bring about the beneficent results of the desired pacification. The financial charges following an upward march strike at the public prosperity at its very source.

"The intellectual and physical strength of the nations, labour and capital, are for the major part diverted from their natural application, and unproductively consumed. Hundreds of millions are devoted to acquiring terrible engines of destruction, which, though to-day regarded as the last word of science, are destined to-morrow to lose all value in consequence of some fresh discovery in the same field.

"National culture, economic progress, and the production of wealth are either paralyzed or checked in their development. Moreover, in proportion as the armaments of each Power increase, so do they less and less fulfil the object which the Governments have set before themselves.

"The economic crises, due in great part to the system of armaments *à l'outrance* and the continual danger which lies in this massing of war material, are transforming the armed peace of our days into a crushing burden, which the peoples have more and more difficulty in bearing. It appears evident then that if this state of things were prolonged it would inevitably lead to the very cataclysm which it is desired to avert, and the horrors of which make every thinking man shudder in advance.

"To put an end to these incessant armaments and to seek the means of warding off the calamities which are threatening the whole world—such is the supreme duty which is to-day imposed on all States.

"Filled with this idea, his Majesty has been pleased to propose to all the Governments whose representatives are accredited to the Imperial Court, the meeting of a conference which would have to occupy itself with this grave problem.

"This conference would be, by the help of God, a happy presage for the century which is about to open. It would converge into one powerful focus the efforts of all the States which are sincerely seeking to make the great conception of universal peace triumph over the elements of trouble and discord.

"It would, at the same time, cement their agreement by a corporate consecration of the principles of equity and right on which rest the security of States and the welfare of peoples."

The Second Rescript

This rescript resulted in the Hague Conference (see page 881), and to the Governments whose representatives took part in it the Tsar addressed a further rescript on January 5th, 1900, drawing attention to—

"The fact that in the new century the rival arming of nations, hitherto confined to land forces, is to be extended also to naval armaments. Navies are being built in hitherto unknown measures, at accelerated speed, for the protection of coasts and for the security and advantage of commerce in distant harbours and colonies. Monstrous sums are being spent on floating fortresses, on cruisers and torpedoes, which are no sooner built than, owing to improved methods of shipbuilding, they become obsolete; in warships, worth millions, which may be sunk in a moment, commerce is not protected.

"The nations are beginning to see more and more clearly the ruinous character and hopelessness of all this; therefore they fall victims to fanatics who utilize this state of affairs to mislead the masses and incite them against all orderly society. The instinct of self-preservation, the laws of the Christian religion, the justifiable claims of the nations longing for peace, demand that this new evil shall be speedily obviated.

"The end of the nineteenth century saw the beginning of the work of peace. Let the opening of the twentieth century see the great idea of universal peace triumphant over human weakness and sinfulness."

From revelations made in September, 1908, it seems that the Tsar was adverse to the Russo-Japanese War, his expression when the possibility of a conflict was discussed being that "war was extremely undesirable."

When it was thought that King Edward might intervene to prevent the threatening railway strike in November, 1907, the *Review of Reviews* remarked, "What is the use of having a King if we cannot use him as a peacemaker?" And, indeed, during the few years he has been on the throne his Majesty has made the prosecution of peace his primary object; not merely peace between men, but peace between nations. The situation was thus expressed by Mr. Maurice Low in 1907, in *The Forum:* "'Peace and goodwill' appear to be tacked up in every European Foreign Office, and this era of good feeling is entirely due to the extraordinary diplomacy and tact of the King of England." It is characteristic of the King that he should be a man of deeds rather than words, but among the various peace-speeches that his Majesty has made may be quoted his speech on February 20th, 1906, when the Moroccan Conference negotiations were in progress:—

King Edward VII.

"It is earnestly to be hoped that the result of these negotiations may be conducive to the maintenance of peace among all nations," he said.

Six days later, on the occasion of receiving deputations with addresses from the convocation of both houses of the provinces of Canterbury and York, King Edward VII., previous to a levée at Buckingham Palace, made the following significant speech:—

"It is ever, as you know, my earnest desire to do all in my power to contribute towards the maintenance of peace and tranquillity throughout the world, and to foster that spirit of goodwill and charity which is characteristic of our holy religion. I share your thankfulness for the peace that has prevailed in Europe throughout my reign, and I rely upon the Christian sentiment of my people for supporting the pacific policy which has consistently guided my counsels."

In Paris, in March of 1906, the *Liberté* reported an interview its representative had with King Edward VII., in the course of which, says the journal, "the King was anxious to make clear that he considers his *rôle* to be that of a peace-maker."

Two months later (May 4th, 1906) when in Paris the King, in responding to an address, said—

"I desire above all the prosperity of your great country; and I am sure that the *entente cordiale* between our two countries will do more than anything else to maintain peace."

In connection with the Seventeenth Universal Congress of Peace, which opened in London, July 28th, 1908, and in reply to an address presented by Lord Courtney, his Majesty said—

"There is nothing from which I derive more sincere gratification than the knowledge that my efforts in the cause of international peace and goodwill have not been without fruit, and the consciousness of the generous appreciation which they have received both from my own people and from those of other countries. Rulers and statesmen can set before themselves no higher aim than the promotion of mutual good understanding and cordial friendship among the nations of the world. It is the surest and most direct means whereby humanity may be enabled to realize its noblest ideals, and its attainment will ever be the object of my own constant endeavours."

Emperor William II.

Two years after the German Emperor's accession, at the opening of the Reichstag (May 7th, 1890), his Majesty said—

"The lasting maintenance of peace is the unceasing aim of all my efforts. I may express the conviction that I have succeeded in inducing all the foreign Governments to put greater faith in the steadfastness of my policy. With me and my exalted Allies, the German people recognize that it is the duty of the Empire to foster . . . the friendly relations existing with all foreign powers, in order to preserve peace and to further prosperity and civilization."

When he visited London in November, 1907, the Emperor's speech at the Guildhall breathed aspirations

for universal peace, and at the state banquet at Windsor Castle on November 12th, after King Edward had expressed "a fervent hope for the maintenance of peace," the Emperor William replied—

"It is also my very anxious wish that the close relationship between our two families may be reflected in the relations of our two countries, and thus confirm the peace of the world, the maintenance of which is as much your Majesty's endeavour as it is my own."

On April 13th, 1908, in his toast when lunching on board of H. M. S. *Implacable*, the Emperor said—

"I drink to our two flags, and wish they may be ever united for the welfare of the world's peace."

Still later, at a banquet in Strasburg, August 30th, 1908, the Kaiser said—

"I rejoice to be able to express to you my deepest conviction that the peace of Europe is not in danger. It rests on too solid foundations to be easily upset by the incitements and calumnies provoked by envious and ill-disposed individuals.

"A firm security exists in the first place in the conscience of the Princes and statesmen of Europe, who know and feel that they are responsible to God for the lives and prosperity of the peoples entrusted to their leadership.

"On the other hand, it is the will and desire of the peoples themselves usefully and tranquilly pursuing the development of magnificent achievements of a progressive civilization, to measure their strength in peaceful rivalry.

"Finally, peace is also assured and guaranteed by our power on sea and land, by the German people in arms. Proud of the manly discipline and love of honour of her armed forces, Germany is determined to keep them on their high level, without menace to others, and to develop them as her own interests demand—favouring none, injuring none."

Theodore Roosevelt

It has been widely admitted that the Chief Executive of the United States is a born fighter, with all the virility that comes of a strenuous life. Nevertheless his views and sympathies are toward peace. President Roosevelt, during his Annual Messages to Congress, December 6th, 1904, December 5th, 1905, and December 6th, 1906, made extended references to international peace, saying among other things—

"The steady aim of this nation, as of all enlightened nations, should be to strive to bring ever nearer the day when there shall prevail throughout the world the peace of justice. The peace of tyrannous terror, the peace of craven weakness, the peace of injustice—all these should be shunned as we shun unrighteous war. The goal to set before us as a nation, the goal which should be set before all mankind, is the attainment of the peace of justice, of the peace which comes when each nation is not merely safeguarded in its own rights, but scrupulously recognizes and performs its duty towards others.

"It remains our clear duty to strive in every practicable way to bring nearer the time when the sword shall not be the arbiter among nations. At present the practical thing to do is to try to minimize the number of cases in which it must be the arbiter, and to offer, at least to all civilized Powers, some substitute for war which will be available in at least a considerable number of instances."

PENAL REFORM LEAGUE: Founded in 1907. Object: To advocate the principle that the treatment of criminals should be entirely curative. *Hon. Secretary:* Capt. Arthur St. John, 7, Holly Village, Highgate, London, N.

PENOLOGY: The trend of recent reforms in the treatment of prisoners in England has been largely in the direction, not so much of exacting punishment for offences committed, as of endeavouring to establish some system for improving the character of the prisoner and rendering him fit to take his proper place in the social scale. Particularly is this the case in regard to young offenders. Under the standing orders for the treatment of juvenile-adult prisoners by the modified Borstal system, as contained in the report of the Commissioners of Prisons for the year ended March 31st, 1908, this class is divided into the following categories: (*a*) prisoners between the ages of sixteen and twenty-one years whose sentences exceed one month and are less than four months; (*b*) prisoners between the ages of sixteen and twenty-one years with sentences of four months and over. Where practicable, prisoners are specially located on reception, unless, in the opinion of the Governor, having regard to their character and antecedents, they are manifestly unfit for special treatment in the class. Those in the Star Class (*i.e.* prisoners whose characters render them unfit to associate with the ordinary prisoners) are, as far as practicable, kept apart from other prisoners. Subject to certain conditions as regards conduct, etc., prisoners may earn remission of their sentences, and special provision is made, where possible, on the discharge of each prisoner for some arrangement with benevolent societies or persons willing to assist the case by finding employment or otherwise. For statistical purposes a register is kept for entering up all the cases treated. During the year dealt with 282 male juvenile-adult prisoners were received into Borstal and Lincoln prisons, in both of which the same system is carried out, the sentences ranging from nine months to ten years, while one was sentenced to penal servitude for life. Special rules sanctioned by Parliament established the system of grades, with particular privileges attached to each, according to industry and conduct, special instruction and useful trades were organized, and physical drill made a part of the daily routine. The Borstal Association make prisoners the subject of care on discharge. A Borstal prisoner, it may be added, is subjected to a very rigorous discipline. He is well, but not over-fed, but he is made to work hard.

Borstal Treatment

On his arrival he is placed in the lowest grade, marked by a brown dress; and under no circumstances does he pass out of this grade and exchange his brown for a blue dress under five months. The strictest obedience to orders is exacted, and any failure to comply with orders or regulations retards the period of advance, which is attainable, not by mere obedience to rules and orders, but only by proof that the youth is doing his best to improve himself in conduct and in what he has to learn. Admission into the higher grade is found to be eagerly sought after. The youth is set to field-work, carpentry, blacksmithing, or cooking and bakery. Even when he has reached the higher grade, however, he may, through bad behaviour, be reduced to the lower penal grade, when he will do his full work, but will have no books from the library, no visits from friends, no permission to write to them. The Commissioners, in their report, state that experience has shown the futility, and perhaps even harmfulness, of admitting to the comparative advantages of Borstal treatment lads under very short sentences, *i.e.* a month or less.

The system initiated at Borstal and followed at Lincoln met with such marked success that local Borstal Committees were later established at nearly all the prisons, the arrangement being that members of the local committees should become *ex officio* honorary members of the Central Borstal Association, which as the parent society directs the general aid on discharge of this category of young prisoners. Tables are given in the report which show that whereas in 1893, 17,940 male and 3645 female

juvenile-adults were received into prison on conviction, their numbers had fallen to 12,644 and 1286 respectively during the year 1907–8.

In 1907 a Bill was introduced into Parliament, entitled "The State Reformatories Bill," for giving effect to the principle of a long period of detention for reformatory purposes, with a free power of conditional licence, where, in the opinion of the authorities, a young offender might be released from detention with a reasonable prospect of his criminal career being broken. The Bill, however, could not be proceeded with that session; but another, for a similar purpose, was introduced in 1908 under the title of the "Prevention of Crime Bill."

Of 189 lads received on release by the Borstal Association during the year, ninety-six were known and twenty-nine believed to be doing well, and the Association express the opinion that absence of a system of control and organization for the employment of the young is one of the principal causes of wrong-doing. In passing it may be remarked that in one of the London prisons many lads of from sixteen to twenty-one are still received who can neither read nor write.

Statistics of Crime

Dealing with the general statistics for the year the Prisons Commissioners, of whom Sir Evelyn Ruggles-Brise is chairman, report that the number of prisoners received into local prisons during the year under sentence of penal servitude or imprisonment by the ordinary courts was 176,602, besides 501 soldiers and sailors sentenced by courts-martial. There were also 17,918 persons imprisoned as debtors, or on civil process, and 1212 in default of sureties, making a total of 196,233. The corresponding numbers for the preceding year were, respectively, convicted by the ordinary courts, 178,343; by courts-martial, 545; debtors and civil process, 19,230; in default of sureties, 1164; total, 199,282. There was, therefore, during the year, a diminution of 3049 in the total number of prisoners, as compared with the previous year.

The population of the local prisons on March 31st, 1908, was 18,354, having been 16,888 at the end of the previous year. The average daily population in 1907–8 was 17,719, viz. 15,055 males and 2664 females. In the previous year it was 17,911, viz. 15,161 males and 2750 females. The population of the convict prisons on March 31st, 1908, was 3029, having been 3038 at the end of the previous year. The average daily population in 1907–8 was 3064, viz. 2934 males and 130 females. In the previous year it was 3032, viz. 2898 males and 134 females.

The number of convicts received into local prisons under fresh sentences of penal servitude during the year was 1179, of whom 430 had served previous sentences of penal servitude, a proportion of 36·5 per cent. as compared with a proportion of 33·2 per cent. during the previous year, when the number received was 1035, of whom 344 had served previous sentences of penal servitude.

The average length of sentences to imprisonment during the year, including both indictable and summary cases, was 39·8 days in the case of male prisoners and 26·3 in the case of female prisoners, as compared with 35·9 days for males and 24·3 days for females in the previous year, an increase of 3·9 days in the case of males, and 2 days in the case of females. The average length of the sentences of all the convicts received into local prisons under fresh sentences of penal servitude during the year was 4·33 years for males and 4·13 for females. During the previous year it was 4·38 years for males and 4·99 years for females.

The following table was also given as showing the actual offences which were the cause of imprisonment over a period of five years:—

	1903–4.	1904–5.	1905–6.	1906–7.	1907–8.
Convicted at Assizes and Quarter Sessions—					
Offences against the person ..	1,495	1,340	1,364	1,442	1,374
Offences against property ..	6,797	7,150	7,357	7,332	7,512
Other offences ..	348	271	251	192	205
Indictable offences tried summarily ..	21,730	21,784	21,890	20,272	20,886
Other offences tried summarily	159,518	167,396	164,194	149,105	146,625
Total	189,888	197,941	195,056	178,343	176,602

A recognized defect in the system of English criminal law, namely, the absence of any right of appeal, either on a point of fact or a point of law, was removed by the passing of the Criminal Appeal Act (England and Wales) in 1907. Its chief provisions are: (1) There is to be an Appeal Court of nine judges, of whom not less than three together shall hear appeals; (2) Upon the certificate of the Attorney-General there may be, as to any exceptionally important point of law, an appeal to the House of Lords; (3) Appeals may be brought (i.) against a conviction (*a*) on a question of law and (*b*) with the leave of the Court, or the certificate of the trying judge on a question of fact alone or of mixed fact or law; and (ii.) against the sentence, unless it is one fixed by law; (4) In ordinary cases if the appeal is allowed the Court shall quash the conviction and direct judgment and verdict of acquittal to be entered; (5) On appeal against sentence the Court may pass another sentence more or less severe; (6) The Court may assign legal assistance to the person appealing; (7) A person appealing who is not admitted to bail may be treated in a special manner or the Court may admit him to bail. Various other powers are given to the Court in certain contingencies, and the prerogative of mercy is to remain unaffected, except that the Home Secretary may refer a whole case or separate points to the Court.

Although in the main subject to the general prison rules, an appellant is, as far as possible, to be kept apart from other classes of prisoners; and, if released after his appeal, such an allowance on account of his earnings, if any, must be paid to him on his discharge as the Commissioners think reasonable.

Probation

Another important Act, which came into operation on January 1st, 1908, was passed in 1907 giving offenders in the United Kingdom a chance of probation similar to that already in vogue in Massachusetts. The Probation of Offenders Act permits the release on probation of offenders, where the Court thinks, having regard to the character, antecedents, age, health, or mental condition of the person charged, the trivial nature of the offence, or extenuating circumstances, it is inexpedient to inflict more than a nominal punishment. In such cases the Court may dismiss the information or charge, or discharge the offender on entering into recognizances to come up for sentence when called upon, during a time specified, not exceeding three years. A recognizance entered into may, if the Court so order, contain a condition that the offender shall be under the supervision of some person named, and also prohibitions of his association with bad company, or taking intoxicating drink, and general conditions for securing that the offender shall lead an honest and industrious life. Such conditions are to be furnished to him written out in simple terms. The appointment of probation officers is provided for, and children's protection officers, at such remuneration as the Court may direct. An offender failing to observe the conditions of release may be brought either before the Court before which he is bound by recognizances to appear, or a Court of

summary jurisdiction, to be sentenced or remanded to the original Court. Youthful offenders under twelve may be sent to a certified industrial school.

Mr. Edward Carpenter, in his *Prisons, Police, and Punishment*, published in 1905, suggested the following prison and judicial reforms, some of which, as will be seen, have now been given legal effect: (1) The conversion of the prisons into industrial reformatories, with associated labour and conditions favourable to a healthy life; and the abandonments of the evils of the solitary system; (2) The cultivation of farm lands in connection with all such reformatories; and a continuous scheme by which prisoners on the expiration of their sentences could be transferred if willing from the industrial and farm work of the reformatory to similar work in ordinary colonies for the unemployed; (3) Instead of short sentences, to substitute at first warnings or fines, leading finally on repetitions of the offence to a long reformatory sentence; (4) The adoption of the indeterminate sentence, and of the probation system—both as practised in the United States, and to some degree already in connection with our juvenile-adult prison at Borstal; (5) To remove the power of sentencing to corporal punishment entirely from the courts, and to allow it only under conditions to the heads of reformatories; (6) The complete abolition of capital punishment; (7) The entire reform of the treatment of prisoners under remand, or awaiting trial; (8) The establishment of a Court of Criminal Appeal.

Scotland

The Annual Report of the Prison Commissioners of Scotland, issued in 1908, gives the number of committals to prison during 1907 as 61,312, an increase of about 1100 over the previous year. The sentences of penal servitude imposed on males, which for the previous ten years had averaged seventy-five, rose suddenly to 122; but, on the other hand, for the first time on record no sentence of penal servitude was pronounced on a female during 1907, and the class of female convicts is stated to be disappearing in Scotland. The average daily numbers in custody were:—ordinary prisoners, males, 2017, females 593; convicts, males 317, females 7. More than 13,000 of those who entered the prisons were there for the first time, and the remainder of the imprisonments, viz. 48,254, were accounted for by 28,424 separate individuals, indicating that many of them had several short sentences during the year. For all crimes and offences the average sentence of imprisonment worked out at 16·5 days. The tendency of the Courts for many years has been in the direction of shortening sentences, and there has been a substantial reduction in the duration of confinement of those incarcerated owing to inability to pay a fine, since under the Fine or Imprisonment Act of 1899 a prisoner may be released at the expiry of half his sentence if he can pay half the fine, and similar proportionate reductions are made when any portion of the fine is paid. In this way the prison population during the year had been lowered in its daily average by 139 inmates.

The number of youthful offenders who were imprisoned in 1907 was 273 males and seven females. In 1877 the corresponding figures were 1051 males and 158 females.

The cost for maintenance of an ordinary prisoner worked out at £20 18*s.* 8*d.* per annum; of a convict, £38 18*s.* 10*d.*; of a criminal lunatic or inebriate, £42 1*s.* 11*d.*

Ireland

In Ireland the number of prisoners committed during 1907, according to the report of the General Prisons Board for 1907–8, was 32,240, and the daily average number in custody 2466, an increase of 375 in the number of committals as compared with 1906, but a decrease of seventy-five in the daily average number, showing that the average term of imprisonment during the year had been somewhat shorter. A table giving the number of prisoners in Irish prisons over a period of ten years shows that the committals in 1907 were 32,240, or a daily average of fifty-six per 100,000 of the population, compared with 38,205, or sixty-four per 100,000, in 1898. The number of prisoners committed to Bridewells during the year 1907 was 478, an increase of forty-four on the number for the previous year. Of these 193 were received under sentence of four days or less, and 285 on remand, 150 of the latter being afterwards committed to local prisons. A tendency in the direction of ceasing to give sentences of one or two days was generally apparent.

A decrease was shown in the number of military prisoners committed, the figures being sixty-eight for 1907, as compared with seventy-eight in 1906. The number of naval prisoners committed fell from seventy-two in 1906 to forty-one in 1907.

Tables giving statistics for 1898 onwards with reference to juvenile offenders showed that the practice of committing children under twelve years of age to prison had been almost given up, only five such committals having taken place in 1907. The number of boys and girls from twelve to sixteen years of age committed during 1907 was, however, somewhat higher than the previous year, though much below the average of the ten years. The figures for 1907 under this head were 161 males and sixteen females, compared with 134 and thirteen in 1906.

The Borstal system was introduced into Ireland at Clonmel Prison in 1906, and has produced similar good results to those shown in England. The number of cases at Clonmel was thirty-two at the end of the year 1907, and they have since increased to thirty-five. As in England, a society has been formed, called the Prisoners' Aid Society, to look after the boys on their release. The great drawback to the system in Ireland, however, is stated to be the shortness of the sentences, which in thirteen out of thirty-three cases sent to Clonmel during the year were for the minimum term of nine months.

In the Prevention of Crime Bill, introduced into Parliament in the summer session of 1908 and still pending, one year is fixed as the minimum term of detention in Borstal institutions. This important measure proposes to deal with two classes who occupy the extremes of the present prison population, namely, the young offender and the habitual criminal. As regards the first class the Bill provides that—where a person is convicted on indictment of an offence for which he is liable to be sentenced to penal servitude or imprisonment, and it appears to the Court that the person is not less than sixteen nor more than twenty-one years of age, and that, by reason of his antecedents or mode of life, it is expedient that he should be subject to detention for such term and under such instruction and discipline as appears most conducive to his reformation and the repression of crime, it shall be lawful for the court to pass a sentence of detention under penal discipline in a Borstal institution for a term not less than one year nor more than three years.

PERSIA: The recent popular movement, which culminated in the granting of a Constitution and the establishment of a Persian Parliament, began shortly before the return of the late Shah, Muzaffer-ud-Din, from Europe on the occasion of his last visit. It evolved out of a demand by the Reform Party for the dismissal of the Minister, Ayn-ud-Dawla, who was disliked on account of his unjust and oppressive measures. He was also regarded as responsible for burdening Persia with further debts to the foreigner. When the crisis was at its height the leaders of the popular party sought refuge at the British Legation at Teheran and the British consulates at Tabriz and Rasht, the garden of the Legation for some weeks in July, 1906, harbouring the tents of some ten thousand Persians of all classes, but chiefly Mullás, merchants, tradesmen, and artisans. The bazaars were closed, and the refugees refused to leave the shelter they had obtained until their demands were granted. The Constitution was signed by the late Shah on the first day of the New Year, 1907, exactly a week

before his death; and the assurance of his son and successor, Mohammed Ali, was also obtained that he would respect the new Constitution and not seek to revoke it.

The National Assembly soon proved that it was no mere docile instrument for the endorsing of the Shah's wishes. Among other acts, it refused absolutely to allow any fresh loans from foreign Powers to be contracted, and demanded that existing loans should be repaid as soon as possible so as to free the country from the danger of foreign control. In this line of conduct the population were wholly with the National Assembly, the clearing off of the Public Debt being eagerly anticipated as the principal step in the direction of the regeneration of Persia. Mohammed Ali, however, while swearing to observe the Constitution faithfully, cast about for ways and means of abolishing it. On ascending the throne, his finances were at a low ebb, the pay of the army was badly in arrears, and as the new Parliament was doing its best to establish a control over the national finances, the Sovereign could hardly look for pecuniary assistance in that quarter. In those circumstances, he may have deemed it prudent to adopt a conciliatory policy, and to feign acquiescence in the development of the new ideas which had led to the introduction of parliamentary institutions on a Western model. Towards the middle of 1908, however, his immediate necessities having been relieved so far as the supply of funds was concerned, and thus being able to secure the support of the army, Mohammed Ali was emboldened to strike a blow for the maintenance of his authority, and a temporary measure of success attended the *coup d'état*. Parliament was summoned to deliver up certain persons who were obnoxious to the Court; and on its refusal, the Shah's troops were sent to enforce the royal command. The revolutionary party, being ill-armed and without a concerted plan of resistance, could make little stand against the Imperial troops, and large numbers were killed. Eighteen leaders of the Reform movement were arrested, loaded with chains, and taken before the Shah, who ordered them to be put to death summarily. The House of Parliament was stormed, the building sacked, and many members slain. During the fighting that followed, in the course of which numbers of the Reform leaders barricaded themselves in the public buildings, shell-fire did much destruction to property, even the Imperial Palace being damaged. The Shah's troops were principally Cossacks, not of course Russians as the name might indicate, but a *corps d'élite* raised from a tribe of nomads in Azerbaidan, a province where the Shahs of Persia have always been able to rely on the loyalty of the Ilyats. The Cossack brigade was drilled and disciplined by Russian officers, and was the only practically efficient military force in Persia.

The Coup d'État

The early successes of the royal troops, however, failed to overpower the revolutionary movement, which gradually grew in strength and regained its ascendency, and in July the Shah felt compelled to issue a rescript promising to rule justly, and to establish courts of justice. Matters, however, remained unsettled for some time, and energetic protest was made against the Shah's refusal to convoke Parliament on a promised date. Towards the end of August the revolutionaries at Tabriz presented an ultimatum to the Shah, demanding the selection of a Ministry from the ranks of the revolutionaries, the expulsion of all reactionaries from Teheran, the granting of a full amnesty, the appointment of governors in accordance with the proposals of the political clubs, and the immediate convocation of the Parliament. On September 25th, it was announced that the Shah had issued a decree fixing the date of the convention of the Mejliss (National Assembly) and the Senate for November 14th, 1908.

PENSIONS, OLD-AGE: (See under OLD-AGE PENSIONS.)

PERSONAL RIGHTS ASSOCIATION, THE: Founded in 1871. Object: To uphold the principle of the perfect equality of all persons before the law in the exercise and enjoyment of their individual liberty within the widest practicable limits. Membership, about 160. Official organ, *The Individualist*, bi-monthly, 2*d*. Hon. Solicitor, Mr. W. P. W. Phillimore, M.A., etc. *Hon. Secretary:* Mr. J. H. Levy, 11, Abbeville Road, London, S.W.

PHTHISIS: (See under TUBERCULOSIS.)

PHYSICAL EDUCATION AND IMPROVEMENT, NATIONAL LEAGUE FOR: Founded in 1905. There are special committees on medical inspection of school-children, the milk supply, and health-visiting; care of infants; promotion of games and physical exercises for working boys and girls, etc. The League has branches in Cambridge, Bristol, and Islington. Official organ, *Progress*, quarterly, 6*d*. Chairman, The Bishop of Ripon. *Secretary:* Mr. F. James Matheson, 11, Southampton Row, London, W.C.

PLAYING FIELDS SOCIETY, THE LONDON: Founded in 1890. Object: To encourage and develop the playing of outdoor games, by the working men and boys of London, with a view to the physical and moral welfare of the population; and to increase the existing supply of public and private playing fields, by acquiring land for the purpose. The Society has 234¾ acres under its control, including 191 cricket pitches and forty-four tennis courts. Chairman, Hon. Sir E. Chandos Leigh, K.C.B., K.C. *Secretary:* Mr. G. J. Mordaunt, 45, Gloucester Street, London, S.W.

POGROM: This Russian term, so frequently quoted in English, signifies a massacre, as specially directed against the Jews living in that country. It is a derivative of the verb *gromic* (to threaten with destruction).

POLICE AND PUBLIC VIGILANCE SOCIETY: Object: To assist persons wrongfully accused or treated with unnecessary violence by the police. Of the eighteen cases investigated by the recent Royal Commission Upon the Duties of the Metropolitan Police fourteen were prepared by the Society, with the result that it was found that seven constables and one sergeant had been "guilty of misconduct," that one inspector had "acted improperly," and three had "committed errors of judgment." (The other four cases investigated by the Commission were those of Dr. Gerothwohl, Madam D'Angely, Mr. Wells, and Mr. Platt.) *Hon. Secretary:* Mr. James Timewell, 141, Gower Street, London, W.C.

POLICE, CITY: (See under LONDON.)

POLICE, METROPOLITAN: (See under LONDON.)

POOR LAWS: According to a statement made in December, 1907, considerably over one million persons are daily afforded relief by the Poor Law authorities of Great Britain, and for their maintenance no less than £17,000,000, or 8*s*. 1*d*. per head of the entire non-pauper population, is the annual levy in poor rates.

The increase in the number of persons becoming chargeable under the Poor Law is one of the most difficult economic problems extant. It is averred that the steady increase cannot be attributed to trade depression, because, over a lapse of years during which the numbers have been augmented, periods of decided prosperity in trade have occurred.

Another critic (vide the *Scotsman*, December 11th, 1907) argues in a circle, viz. that radical defects in the Poor Law itself inculcate indolence, and the indolence

so nurtured induces a gravitation back to Poor Law relief. In short, the Poor Law system is utterly wrong in principle, it is alleged, insomuch as it is continuously manufacturing the paupers it relieves.

Mr. Will Crooks, M.P., contributed an article on the Poor Law to the *South Wales Daily News*, of March 13th, 1907, in which he raised a "plea for a humanizing system." He dealt historically with the administration of the Poor Law, dwelt on its difficulties and defects, and gave his plan for betterment—

"May I summarize just what I have got in my mind?

Mr. Will Crooks's Remedy

"(1) The suggestion I make is, that all schools at present controlled by the Poor Law Authorities for the maintenance and education of children should be transferred to the Education Authority.

"(2) Districts should be created for the express purpose of dealing with all men, young men, and young women too, who are able-bodied, so that they may be treated in a very different way to what they are now. What happens is that you frequently get an aggregation of these people in one district and a sparse number in another, and instead of anything you do for them lifting them up, it degrades them. I want each district formed to be so organized as to cover a certain area of work which shall be of an instructive character, with kindly, but firm, discipline, so that in a very short time it would be worth any person's time to employ these people. So instead of becoming degenerate, they would become useful. This cannot be done in small communities.

"(3) Vagrants I would deal with as a separate class much under the same plan. There should be something like compulsory detention of both classes. That is to say, I would give them reasonable opportunities, and I would not enforce compulsory detention without some reason. The '99 Act, dealing with the able-bodied, says: 'If he is, in the opinion of the Guardians, discharging himself frequently without sufficient reason, he shall give so long a notice.' If it is found that a man only uses the house as a convenient shelter, the moment it is made a place where proper discipline is to be taught, I feel there must be brought to bear some form of detention on these people. The same should apply to vagrants who make no effort whatever to improve themselves, and I think the county authority should have some place that the police might send such people to, as apart from the genuine person.

"(4) The unemployed are another class of men entirely, whom the Unemployed Workmen's Act was passed to deal with. This is one of the measures the success of which depends so much on the desires of the administrators to do good with. It seems to me that the scope of the Act must be enlarged and that some discriminating power must be given to this Poor Law authority to relieve men and to organize work during periods of temporary slackness. I have seen more men and more little children broken down than there is any real necessity for; even under existing conditions children waiting outside the relief office for bread the father was obtaining. The association of these children with the Poor Law is always an evil. If a county or district authority was allowed in the absence of work to give some kind of relief it would keep these people away from the Poor Law, and altogether would be a reform little dreamed of by people outside the Poor Law.

"There would be left only the aged men and women to be cared for, and with old-age pensions looming in the near future, these old folks would be allowed to remain at home with their friends."

Dr. T. J. Macnamara, at the time Parliamentary Secretary, Local Government Board, speaking on Dec. 12th, 1907, at a Poor Law Conference, said—

Dr. T. J. Macnamara, M.P.

"Poor Law guardians in England and Wales have control of an expenditure of fourteen millions and 820,000 persons, and in London only nearly four millions of public money is expended in the care of 80,000. When the Old-Age Pensions scheme is in full working order, three and a quarter millions of the money now spent in outdoor relief will be saved, but it will not move the ninety per cent. permanent paupers who inhabit poorhouses. Such are old, feeble, and infirm, and if sent outside they would die off like flies in the absence of skilled care and nursing. There exists a great lack of public interest in the work of guardians, an average of only 28·1 per cent. vote therefor at the elections. Inside the workhouse, I found on a tour to twenty-five different Poor Law institutions, in various parts of the country, that paupers were homely and comfortable, but the life was too monotonous. The Poor Law problem is of a special character, and requires special treatment. As to the children, I am quite happy in my mind as to the great care extended to them in the cottage homes, scattered homes, district schools, the boarding-out system, and on emigration. It is noteworthy that only in the rarest cases children return when adults to become chargeable to the Poor Law funds. With regard to the vagrant, whilst the authorities cannot be too severe with the incorrigible loafer, the present casual ward treatment of him is silly, because it does not tend in any way to regenerate him. He should be taken to, and kept permanently on, a labour colony. With regard to the few rare cases of honest men seeking work among the vagrant class, the casual ward treatment is, in my estimation, brutal to the last degree."

The question of the administration of the Poor Law became so acute that a Royal Commission on the subject was formed.

Under the title of the Royal Commission on Poor Laws and the Relief of Distress, the body was appointed in December, 1905, for the purpose of in-

The Royal Commission

quiring into the conduct and administration of the Poor Law (see page 920). It was very soon discovered that the inquiry would occupy a much longer time than originally conjectured, and that the ramifications of the matter engaging their special attention needed to be sectionized in order that investigation should be thoroughly conducted. The complexity of some of the problems with which the Commission had to deal were such that Lord George Hamilton, the chairman, appointed on behalf of the Commission a band of expert investigators whose province it became to collect evidence on their special subjects, which were thus allocated—

> The relation of industrial and sanitary conditions to pauperism, with special reference to the effect of dangerous or unhealthy trades, casual labour, seasonal trades, housing, etc.—Mr. A. D. Steel-Maitland, M.A., Fellow of All Souls' College, Oxford, private secretary to the late Chancellor of the Exchequer; Miss R. E. Squire, one of H.M. Inspectors of Factories.
>
> The effect of outdoor relief on wages and conditions of employment.—Mr. T. Jones, M.A., Assistant to Professor of Economics at Glasgow University; Miss Constance Williams, secretary to the Women's Educational Council.
>
> Effect of employment or assistance given to the unemployed since 1886 as a means of relieving distress outside the Poor Law.—Mr. Cyril Jackson, M.A., Barrister-at-Law, late Chief Inspector of the Board of Education, now hon. secretary to the Stepney Distress Committee; the Rev. J. C. Pringle, late of Indian Civil Service, curate of St. John's at Hackney, and chairman of the Men's Institute.

In total the Commission sat for considerably over two years, and their report was expected towards the end of 1908. By June, 1906, fifty meetings had been held. The nature of the proceedings of the Commission will not become public property until this report is issued, but an interim communication made by the

secretary of the Royal Commission on December 18th, 1907, outlined the general trend of the inquiry. During the first seven months of 1907, the Commissioners mainly devoted their attention to studying the methods of the Poor Law administration in the provinces and Scotland, receiving a great mass of written and oral evidence from local representative witnesses as to the working of the Poor Law, the method of outdoor medical relief, the relation of charity and of voluntary effort and of self-help societies to the Poor Law. The Commission also visited about one hundred Unions in England, and spent a month on a similar quest in Scotland. All this was in addition to the special inquiries of the expert investigators above referred to. Two statistical inquiries undertaken by the Commission which may be expected to be productive of valuable data have been undertaken; one, with the object of obtaining a census of all persons relieved in every Poor Law area in the United Kingdom on March 31st, 1906, and the other to afford tabulated information as to the nature of the diseases from which sick paupers were suffering. Other useful figures will doubtless be the reports being produced of the total number of persons relieved during the course of twelve months, with the periods of the recurrence of relief. Another section of the Commission's operations has been devoted to ascertaining the extent of poverty in each parish throughout England, Wales, and Scotland, and how far it is relieved by existing agencies. Another channel of inquiry has been to collect information relating to Poor Law systems of most of the European countries, the United States, Australia, New Zealand, and Canada. For three months the Commission took evidence from witnesses on the subject of distress due to unemployment, and supplemented the same by a large amount of written evidence from persons interested in the subject. This included the views of every Distress Committee in the country on the subject of the Unemployed Workmen Act, and questions circulated among eminent political economists, employers and representatives of labour, social workers, etc., on matters relating to the conditions of labour as affecting unemployment, trade depressions, etc. Up to December, 1907, the Commission had examined about four hundred witnesses, had received evidence from nearly one thousand persons, and expressions of opinion from some fifteen hundred Poor Law bodies in the United Kingdom.

To Abolish the Guardians

Notwithstanding the fact that the report of the Royal Commission had not been issued by September, 1908, articles and statements appeared in the Press shortly after the sittings closed, in which it was forecasted that the recommendations would be crystallized into the dictum—abolish the Poor Law guardians and vest the working in the County and Borough Councils.

A series of three articles appeared in the *Times*, during August, 1908, under the title "The Breaking-up of the Poor Law," from which the following is extracted:—

"Our present methods are deterrent; the Poor Law of 1834 asserted this principle, and ever since it has been in force it has shown that deterrent treatment has not brought about that improvement in the classes from which the large body of paupers are recruited, and has not secured the decrease in pauperism which it was hoped would follow from its operation. Moveover, the administration of the Poor Law for many years past has overlapped the operations of other public authorities.

"It is understood that the Royal Commission, in the consideration of their report, have had two main principles before them: (1) the abandonment or breaking up of the present system altogether in favour of the separate and curative treatment of the various classes of paupers under authorities which are already charged with similar duties; and (2) the abolition of boards of guardians and the establishment in their place of a Poor Law Committee of the county or borough council. It is claimed for the first proposal that it will be far more effective in its administration than the second, which would continue a Poor Law authority under another name, and that it will leave room for any amount of charitable effort in aid of official work. As it is not unlikely to be found, when the report of the Commission is issued, that what is called the breaking-up principle has recommended itself to many, if not to most, of the Commissioners, some features of the policy may be pointed out.

"Shortly stated, it means the transfer of the children, the sick and infirm, and the aged from the control of boards of guardians to the care of committees of the county or county borough councils which are doing similar work; provision for the adult able-bodied by a separate committee of the county or county borough authority, and on national lines; and the disappearance of boards of guardians.

"It has been a serious defect in our existing system that boards of guardians have regarded the Poor Law as the rival of these agencies. With the break-up of the Poor Law and the formation of the judicial Court of Relief there would be an excellent opportunity for the systematic intervention of organized voluntary agencies."

The *Standard* of August 17th, 1908, in a leading article, said—

"The appointment of the Royal Commission was a recognition of the prevailing belief that some change is needed. The present situation is unsatisfactory. There is more wealth in the country; the standard of comfort has risen; but pauperism has not been substantially diminished. The fact may be due to many causes, some of which need not now be discussed. But there is not, we imagine, much doubt that the Poor Law administration is itself partly responsible for perpetuating the evils which it endeavours to alleviate. The weakest point of our Poor Law system is that it does not clearly distinguish between the deterrent and the curative functions of public charitable relief.

Differences and Distinctions

"An adequate reform of the Poor Law will take account of these differences and distinctions, and provide for a thorough and systematic classification of the temporarily and permanently destitute. But public charity, like all other branches of scientific action, will not be effective without careful specialization and the methodical adaptation of means to results. It is also to be hoped that, while supplementing what is defective in our present system, and correcting its faults, the new plan will avoid the peril of reintroducing the mischiefs which the Act of 1834 either extinguished or materially reduced. Vain, indeed, would be any reconstruction which would revive and reinforce the pauperizing influences from which the country was rescued—not too soon."

The *Morning Post* of August 17th, 1908, concluded a leading article on the subject with the words—

"The aim of all treatment should not be to deter a man from applying, but to put him under strict discipline and thoughtful training when he has applied, so as to restore him, not as at present impaired in morale and physique, but educated and moralized, to his place in industry. The watchword of the Poor Law has hitherto been deterrence: in the future it must be education. For, to quote the words of Dr. Schwander, one of the greatest German authorities on the organization of the Poor Law, 'the only sound method of relief is education.'"

Those responsible for the administration of the Poor Law abroad express astonishment at the vast expenditure under the British Poor Law system, and cannot conceive how it is that, whereas we pay two, three, and even four times per head as much as is paid in Hungary, Austria, Denmark, Germany, and other countries, yet the results are worse than in all or any of these countries. As Miss Edith Sellers says in the introduction to her recent book, *Foreign Solutions of Poor Law Problems*—

"No country but England could afford to spend £14,000,000 a year on poor relief . . . yet in foreign Poor Law Departments our expenditure on poor relief is regarded as quite appalling; the officials there speak of it with bated breath and wonder what we can possibly do with our £14,000,000; how we can manage to spend them in fact, and yet have so little to show for our money.

Foreign Methods

"Out of ten countries in which the systems of caring for their poor were investigated, there are only three under which the deserving poor, and especially the aged deserving poor, suffer so keenly as under ours; and not one at all under which the undeserving, the thoroughly worthless, are made quite so comfortable."

Contrasting our methods with those of Germany, where they have a very practical system of dealing, not only with orphan or destitute children, but also with those whose parents are unworthy of the name, Miss Sellers observes—

"What for us is more serious . . . in Germany and Hungary destitute children are infinitely better cared for than in England: a better chance is given them, not only of living and thriving, but of making their way in the world and becoming useful, prosperous citizens. . . . In Berlin it is not only the children who are motherless or fatherless who rank as orphans, but all those whose parents are in prison or who are suffering from chronic disease, and therefore cannot maintain them; or whose parents neglect them, illtreat them, set them a bad example or have deserted them. All these children are under the guardianship of the Orphans' Board; as by German law their parents have forfeited their rights over them, although they remain responsible for their maintenance. The Berliners have many institutions of which they are proud; but of none of them are they so proud, or with such good reason, as of the Orphans' Depôt, the refuge they provide for their destitute children. It is a wonderful place, a perfect model of skilful organization combined with careful management; and the good that is done there is untold. Within its walls more baby lives are saved, more boys and girls are rescued from ruin, more little ruffians are made to see the errors of their ways, and stumbling little 'Marchionesses' are kept from falling, than within those of any other building in the world."

Comparative Statistics

The following table shows for each year from 1898 the number of paupers on July 1st, distinguishing casual and insane paupers, and the indoor and outdoor paupers, exclusive of the two first-mentioned classes.

The figures are ranged in groups to indicate the rise and fall of pauperism in the successive periods.

Years.	Population.	Paupers, except casual and insane paupers.		Casual Paupers.		Insane.	Total number relieved.	Rate per 1000 of estimated population.	
		Indoor.	Outdoor.	Total. (a).	Relieved on night of July 1st. (b).			England and Wales.	London.
1898	31,517,725	180,620	*561,376	9,357	5338	91,570	*842,731	26·7	26·1
1899	31,881,365	177,475	496,913	8,959	5361	94,056	777,263	24·4	25·9
1900	32,249,187	174,528	483,566	7,779	4170	95,428	761,248	23·6	25·5
1901	32,621,263	181,777	490,895	8,407	5445	97,096	778,084	23·9	26·0
1902	32,997,626	189,889	497,852	10,717	6609	99,769	798,092	24·2	26·6
1903	33,378,338	195,561	499,544	8,634	5121	102,699	806,231	24·2	26·9
1904	33,763,434	206,118	515,568	10,843	6748	104,823	836,463	24·8	27·8
1905	34,152,977	214,884	532,778	14,920	8556	107,728	869,777	25·5	29·5
1906	34,547,016	215,713	547,798	13,017	6574	109,726	885,794	25·1	28·5
1907	34,945,600	222,480	523,883	11,408	6997	111,074	868,276	24·8	28·8

* Including 83,670 persons relieved in the unions in Monmouth and South Wales during the coal strike in 1898, compared with 43,712 on the same date in 1897.

Dealing with the last of the period of years shown in the above table, it will be seen that an increase in the proportion of the population, who received Poor Law relief, which occurred between the years 1901 and 1905, was followed by a decrease in 1906, which was maintained in 1907. In spite of a slight increase in the actual number of persons relieved, the rate per thousand of the population on July 1st, 1907, was lower than the rates recorded in 1906 and 1905, and was, with the exception of the five years 1899 to 1903, the lowest in the table.

The statistics of pauperism in Scotland show the averaged total for the six years ending 1906 to be 106,461 in receipt of poor relief, ratio to population 2·3, average amount expended in relief and management of the poor £1,351,351. For Ireland during the same period the averages show 102,549 in receipt of poor relief, ratio to estimated population 2·33, average amount expended in relief and management of the poor £1,217,651.

The return published on July 21st, 1908, gives statistics of Poor Relief for the six months ending Michaelmas, 1907, which with the figures already available for the previous six months enables the following table to be compiled, showing the total expenditure (other than out of loans) of Boards of Guardians connected with the relief of the poor during the twelve months ended at Michaelmas, 1907:—

Item.	Expenditure in unions and parishes.		Total for 12 months.
	6 months to March 25, 1907.	6 months to Sept. 29, 1907.	
Maintenance of indoor paupers—	£	£	£
(*a*) In establishments provided by Poor Law Authorities ("In-maintenance") ..	1,691,381	1,550 807	3,242,188
(*b*) In establishments not provided by Poor Law Authorities (other than asylums, etc., for lunatics)	110,454	114,854	225,308
Out-relief	1,602,474	1,623,454	3,225,928
Maintenance of lunatics in county and borough asylums, registered hospitals, etc.	1,186,865	1,166,184	2,353,049
Salaries, etc., and superannuation allowances of union officers and servants	1,255,958	1,286,407	2,542,365
Loan charges (principal repaid and interest)	602,551	635,095	1,237,646
Other expenditure connected with relief..	832,695	864,710	1,697,405
	7,282,378	7,241,511	14,523,889
Deduct— Estimated value of transfers between certain accounts (farm, etc., and "In-maintenance").	159,570	141,716	301,286
Total expenditure (excluding expenditure defrayed out of loans)	7,122,808	7,099,795	14,222,603

Thirty-five per cent. Increase

Thus during the half-year ended Michaelmas, 1907, the amount expended on the maintenance of indoor paupers and out-relief in England and Wales was higher than during the previous nine half-years (each to Michaelmas). During the whole period, while the estimated population increased nearly eleven per cent., the expenditure on the maintenance of indoor paupers increased nearly thirty-five per cent. Comparing the figures for London with the rest of England and Wales, it was found that the cost of maintenance of indoor paupers in London per head of population was in 1907 more than three times the cost per head in the aggregate of the rest of England and Wales, while the cost of out-relief, on a similar calculation, was about thirty-eight per cent. lower in London than elsewhere. Similarly the number of indoor paupers relieved in London on July 1st, 1907, represented 15·7 per thousand of the population,

as contrasted with a rate of only 5·9 per thousand in the rest of the country. In relation to population, the rate per head of expenditure on maintenance of indoor paupers in London increased from 2*s.* 0¼*d.* in 1898 to 2*s.* 5¼*d.* in 1903 and 1905, falling to 2*s.* 3½*d.* in 1906, but rising to 2*s.* 4*d.* in 1907, while in the rest of England and Wales the rate, which in 1898 was 7*d.*, rose to 8¾*d.* in each of the half-years ended Michaelmas, 1905 and 1907.

A useful table is issued weekly by the Local Government Board giving the number of persons in receipt of poor relief in London on Saturday of each week. That for Saturday, August 29th, 1908, issued September 4th, 1908, shows that the total was 118,580—75,212 indoor, and 43,368 outdoor paupers—being an increase of 3703 on the corresponding date of 1907.

In the following table is shown the number of indoor and outdoor paupers in London on this particular Saturday and on the corresponding Saturdays in the preceding three years, with the total rate per thousand of the population :—

	Indoor.	Outdoor.	Total.	Per 1000.
1905	72,243	44,686	116,929	25·0
1906	71,978	40,176	112,154	23·8
1907	73,157	41,720	114,877	24·1
1908	75,212	43,368	118,580	24·7

It will thus be seen that though the number of indoor paupers is larger than in 1905, the persons in receipt of outdoor relief are fewer in 1908, while the total rate per thousand of the population is also lower than it was four years ago. Although the number of paupers per ten thousand of the population fluctuates, the ratio shows that on the whole there is a decrease. Thus in 1861 the ratio was 364, in 1871, 393, in 1893, 254, in 1901, 240, and in 1907, 257.

Statistics relating to pauperism in Scotland were issued in the form of a parliamentary return on August 21st, 1908.

In Scotland

The number of sane poor relieved by the Parish Councils during the year ended May, 1907, was 147,660, being equal to 330 per ten thousand of the population census 1901. Of that number 90,073, or 201 per ten thousand of the population, were paupers or heads of families, and 57,587 were dependents, or the wives and children of paupers. The paupers included 33,970 males, 47,793 females, and 8301 children under fourteen. The dependents numbered 850 males, 8506 females, and 48,231 children under fourteen. The ratio these numbers bore to each ten thousand of the population was 201 paupers and 129 dependents, or 330 in all. Lunatics were not included, and any person chargeable several times during the year was reckoned as one case only.

The tables dealing with the nature of the relief indicate the extent to which the Scottish system of poor relief may be said to be an outdoor system. Institutional relief was given to 37,368 persons, or eighty-three per ten thousand of the population; outdoor relief to 106,883, or 239 per ten thousand of the population; and relief, partly institutional and partly outdoor, to 3409, or eight per ten thousand of the population. Considerably more than one-half of the male adults were relieved in institutions (chiefly poorhouses), while of the female adults about one-fifth only were relieved in institutions, and of the children about one-tenth.

Of the total number of poor (147,660) relieved during the year, 10,096, or 6·8 per cent., were chargeable for one week; 35,426, or 24·0 per cent., for over a week, but less than three months; 14,889, or 10·1 per cent., for three months, but less than six months; 19,102, or 12·9 for six months, but less than a year; and 68,147, or 46·2 per cent., were chargeable for the whole year. Of the total number relieved 76,564 were relieved in county areas, while the number relieved in the large town parishes was 71,096.

The ratio of paupers under sixty-five years of age to the total population was much higher in large towns than in counties, while as regards those sixty-five years of age and upwards, the proportion was higher in counties than in the large towns. Of the total poor in counties, 34·4 per cent. were between fourteen and sixty-five years of age, and 26·7 per cent. were over sixty-five years of age; in the large towns 45·7 per cent. were between the ages of fourteen and sixty-five, and only 16·8 per cent. were over sixty-five.

The half-yearly statement of pauperism in England and Wales, issued by the Local Government Board in August, 1908, showed that while for the greater part of the year preceding January 1st, 1908, there was a satisfactory decrease generally, except in London, towards the end of 1907 the percentage of persons requiring relief was considerably on the increase. On the basis of population, however, there was a fractional decrease in pauperism throughout the country as a whole during the six months, but an increase in London. The following are the figures :—

	London.	Provinces.	Total.
Paupers	122,015	677,624	799,639
Insane	25,472	87,218	112,690
Casuals	1,726	15,357	17,083

After deducting 257 persons in London and 484 in the provinces, who are counted twice in the preceding figures by reason of being reckoned for various reasons both as indoor and outdoor paupers, the total numbers in receipt of relief on January 1st, 1908, were as follows, compared with January 1st, 1907 :—

London .. .. 148,956, or 2·5 per cent. more
Provinces .. .. 779,715, or 0·5 ,, ,,

Taking the whole country there were 928,671 paupers, an increase of 7833, or 0·9 per cent.

On the basis of estimated population taken in the middle of 1907 the paupers relieved in England and Wales amounted to one in every thirty-eight persons, or 26·6 per thousand, as against 26·7. In London it was higher, being one in every thirty-two persons, or 31·3 per thousand, showing a comparative increase of 0·5.

Ratio of Increase

The report further stated that throughout the country the out-relief lists showed but a small variation, the increase in the aggregate numbers being attributed to indoor relief, this development being general. The rise in the numbers of pauper insane was normal.

In London the numbers (exclusive of casuals and paupers) exhibited an aggregate increase of 5·7 per cent., distributed as follows, the ratio being per thousand inhabitants :—

	No.	Ratio.	Inc. or dec.
West	15,653	18·4	− 0·1
North	26,494	24·3	+ 0·6
Central	9,205	48·7	− 2·8
East	23,495	32·3	+ 0·4
South	46,911	24·7	+ 1·2

A diagram given in the report emphasized the decline in the country generally already mentioned. In the period 1872–77 the ratio was 35·4 per thousand, which came down to 26·6 in 1893–1901, and to 26·4 in 1902–8. In London, however, the rate in 1908 (31·3 per thousand), though lower than in 1905 and 1906, was in excess of any other year since 1875.

According to the report of the Local Government Board for Ireland for the year ending March, 1908, pauperism was slightly on the decrease in that country during that period. The cost of in-maintenance, however, showed an increase, attributed to the enhanced price of provisions.

Notwithstanding the partial failure of the potato crop in some of the western unions, the total average of persons relieved, both indoor and outdoor, each day in 1907–8, was 101,181, against 101,183 in the preceding year. The figures for both years were taken to represent one in forty-three of the population, or twenty-three per thousand inhabitants, those relieved indoors being about ten and those outdoor thirteen per thousand.

The expenditure on indoor and outdoor relief came to £1,048,465 (against £1,041,620 in the preceding year). In addition, the boards expended various sums under the Medical Charities and other Acts, bringing up the total to £1,331,259 (as against £1,322,270). Their receipts from revenue came to £1,332,268 (against £1,289,567).

A historical survey of the Poor Law problem in its world-aspect and in the United Kingdom prior to the present Commission will be found on pages 915 (POOR-HOUSE), 917 (POOR LAWS, ENGLISH), 873 (PAUPERISM AND POOR RELIEF), and 1255 (VAGRANCY).

PREVENTION OF CRUELTY TO CHILDREN, THE NATIONAL SOCIETY FOR THE: Statistics relative to this Society will be found on page 949. Readers referring to the subject will also be interested to note that his Majesty, King Edward VII., when Prince of Wales, paid the following tribute to the N.S.P.C.C. :—

"It addresses itself to objects which have been long sought after—namely, the improvement of the lot of unhappy and miserable children. The State and the community have for some time past been interested in these aims, the former by sending such children to industrial schools and reformatories, and the latter by removing them to homes for the destitute and to hospitals, and by country holiday schemes. This Society would free the little sufferers by emancipating their homes. Its plan, however, is not to remove children from their parents, but to endeavour to reform the latter.

"This, the first Society dealing with the miseries of children, formally recognizes that the evil parent is the cause of these miseries, and that to reform him or her, or both, is to cure the evil. The Society believes that underlying the nature of the worst father and the worst mother there exists a natural parental feeling. Its methods are designed to reach and revive that feeling. It has directed its attention to more than 100,000 miserable homes in the United Kingdom with results which have more than justified its belief in the wisdom of its policy, and which lead it to look forward with great hope to the future.

"Three hundred and fifty thousand children mostly in pain and misery, either of body or mind, have been helped towards peace and happiness. They have been properly fed, comfortably clothed, and reasonably treated, not in new homes, but in their old ones, not by the hands of strangers, but by those of their own fathers and mothers. You see by this that the Society has struck out for itself a new line, and has made a great social discovery. It has gained the desired benefits for the children by freeing their parents from their vicious habits, and by raising and ennobling them. It has neither fed children who were hungry, nor given clothes to half-naked children. It has simply set in motion in the mind and character of their parents new and fresh motives, and by no other means than this does the Society work to attain its end.

"The Society appealed to Parliament to reform the law, and then said it would endeavour to remedy the evils against which civilization and humanity cried out. The appeal met with a favourable response, and the Society claims that its promise has been fulfilled. In this Society a wholly new power has been brought into play, for until the Act of 1889 was passed, and the organization for the enforcement of the Act was perfected, the parents could not be compelled to do their duty to their children."

PREVENTION OF PREMATURE BURIAL, THE SOCIETY FOR THE: Founded in 1896. Object: The scientific investigation of trance; the diffusion of knowledge regarding the causes and consequence of suspended animation, and the promotion of effective legislation for the compulsory verification of death in all cases before the supposed corpse is treated as dead. Official organ, *The Burial Reformer*, quarterly, 6*d*. President, Mr. William Tebb, F.R.G.S. *Secretary*: Mr. N. W. Denton Ingham, 19, Farringdon Street, London, E.C.

PRISONS: (See under PENOLOGY.)

PROFIT-SHARING AND CO-PARTNERSHIP: Particularly among Gas Companies is the system of profit-sharing growing. In addition to the companies referred to on page 964, the companies at Leamington, Rugby, Walker and Wallsend, and Wrexham have adopted the system, and others (Tottenham, etc.) have it in course of arrangement.

At the time of the death, in October, 1908, of Sir George Livesey, Chairman of the South Metropolitan Gas Company, London, where profit-sharing in gas was instituted, the employees had £320,000 invested in the company. The system at the South Metropolitan Gas Company is not profit-sharing pure and simple, but embodying investment. Sir George Livesey always maintained, as he stated before the Institution of Gas Engineers, on June 16th, 1908, that "simple profit-sharing—that is, the payment of an annual bonus in cash—will not be a permanent benefit either to the men or their employer. The effect soon passes off, and simple profit-sharing in most cases is sooner or later given up. It does not promote thrift, but the reverse, and to be a success it must be made the means of enabling the workers to become owners of property as shareholders, and therefore partners. It is the shareholding that creates and sustains the interest in the business, which increases as the investments increase."

The advantages of the system were shown at the meeting by a table of the South Metropolitan Company, compared with other companies not having the system. The difference in favour of the South Metropolitan Company from 1891 to 1898 inclusive, averages one penny per thousand feet sold against 0·18 of a penny in 1888. In the eight years, £820,000 was paid for carbonizing labour, which is £260,000 less than it cost the other companies to make the same quantity of gas, or very nearly twenty-five per cent. lower.

The whole of the difference, of course, could not be owing to the co-partnership, but better machinery and methods and economic conditions could not account for more than a percentage of this result.

In Batley, Yorkshire, Mr. T. C. Taylor, M.P.,

introduced profit-sharing into his mills almost as soon as they came into his possession on the death of his father in 1892; first among the heads of departments, and then to the whole of the employés. The bonus is arranged in proportion to the wages paid out, and it varies from ten per cent. (1904–5–6) to 7½ per cent. (1901, 1902, 1903, 1907). This is more than under the South Metropolitan Gas Company's system mentioned above.

On October 7th, 1908, Sir Christopher Furness, chairman of the famous Tyneside shipbuilding firm, made a unique offer to the Trade Unions interested in the shipbuilding trades. Sir Christopher offered to 135 delegates to hand over the works at Hartlepool and West Hartlepool to representatives of Trade Unions at a fair valuation and on preferential payment terms, with the added advantage of full expert assistance and advice from himself and the present departmental chiefs. Failing acceptance he offered a profit-sharing or co-partnership scheme ensuring a four per cent. interest to all employés participating—whether the business showed a profit or not. This would be achieved by workers taking up shares in the companies, to be gradually paid for by a five per cent. wage-reduction until the share-value was met, and such shares so taken would be guaranteed the interest above mentioned.

Over one hundred delegates were appointed to consider the matter and recommended, on October 23rd, 1908, that the workmen should accept Sir Christopher's co-partnership scheme, on a year's trial. The Trade Unions had until November 28th to decide which of the alternative proposals to accept.

PROGRESSIVE EDUCATION COUNCIL, LONDON: Founded in 1894. Object: To promote and defend in London the principles of National education, efficient, progressive, free, unsectarian, and under popular control. Membership, about ten thousand. The Council's work includes help at local elections for educational bodies. President, Lord Stanley of Alderley. *Secretary:* Miss Constance Williams, Caxton House, Westminster, London, S.W.

PROHIBITION CONFEDERATION, THE WORLD'S: Temporary organization effected in January, 1908. Object: To better unite the forces working in various countries for the suppression of the drink traffic through legislative means. *Founder and Hon. Secretary:* Mr. Edward Page Gaston, F.R.G.S., 133, Salisbury Square, London, E.C.

PROHIBITION PARTY, THE NATIONAL: Founded in 1899. Object: To advocate the prohibition of the liquor traffic by non-production. Official organ, *The Prohibitionist*, monthly, ½*d.* Chairman, Mr. W. H. Goldsmith. *Secretary:* Mr. T. Portway, Alliance Hall, Albury Street, Deptford, London, S.E.

PROHIBITION PARTY, THE SCOTTISH: Founded in 1901. Official organ, *The Scottish Prohibitionist*, monthly, 1*d.* Chairman, Mr. R. Stewart. *Secretary:* Mr. Councillor E. Scrymgeour, 2, Errol Terrace, Dundee.

PROMOTION OF PUBLIC MORALITY, LONDON COUNCIL FOR THE: Founded in 1900. Membership, about one hundred. President, The Bishop of London. *Secretary:* Mr. E. Fox Butlin, 37, Norfolk Street, Strand, London, W.C.

PROPORTIONAL REPRESENTATION SOCIETY, THE: Founded in 1884. Object: To improve electoral methods by the adoption of a system of proportional or real representation. The Society favours the Clark-Hare or Hare-Spence system of the "single transferable vote" now in operation in Tasmania. Official organ, *Representation*, monthly, 1*d.* President, Lord Avebury. *Hon. Secretary:* Mr. John H. Humphreys, 107, Algernon Road, Lewisham, London, S.E.

PSYCHICAL RESEARCH, THE SOCIETY FOR: Founded, 1882. Membership, twelve hundred. President, Mrs. H. Sidgwick. *Secretary:* Mr. R. A. H. Bickford-Smith, 20, Hanover Square, London, W.

PUBLIC GARDENS ASSOCIATION, METROPOLITAN: Founded in 1882. Object: To preserve, acquire, and lay out open spaces of all kinds in the Metropolis and its suburbs for public recreation. Also for tree-planting in streets, provision of seats, encouragement of outside window-gardens, etc. Membership, about 850. President, The Earl of Meath, K.P. *Secretary:* Mr. Basil Holmes, C.C., 83, Lancaster Gate, London, W.

PUBLIC HEALTH, THE ROYAL INSTITUTE OF: Founded in 1886. Objects: (1) To provide a central institution in London for the training of medical practitioners for the diploma in public health. (2) To provide the means whereby municipal and other authorities and medical practitioners can obtain reliable bacteriological and chemical analyses. (3) To aid the practical and theoretical investigation and study of all branches of preventive medicine, etc. Membership, fifteen hundred. The Institute has founded bacteriological, chemical, and parasitological laboratories. Official organ, *The Journal of the Royal Institute of Public Health*, monthly, 2*s.* President, Lord Strathcona. *Hon. Secretary:* Mr. James Cantlie, M.A., M.B., 37, Russell Square, London, W.C.

PUBLIC LIBRARIES: (See under LIBRARIES.)

PURE LITERATURE SOCIETY: Founded in 1854. Object: To promote the circulation of pure and healthy literature. President, Lord Kinnaird. *Secretary:* Mr. Richard Turner, 11, Buckingham Street, Adelphi, Strand, London, W.C.

R

RAGGED SCHOOL MOVEMENT, THE: At Portsmouth, about 1810, Mr. John Pounds gathered together some ragged urchins in the effort to help them. Others in English towns followed his example, and in 1844 some teachers established the Ragged School Union in London, with the Earl of Shaftesbury as president. In barn, shed, or railway arch, Christian workers, mostly working people, gathered the unkempt, wild, and ignorant children, and taught them the rudiments of knowledge. Ragged Day Schools were established increasingly without school fees, and in 1906 the last of these Day Schools was finally merged in the regular education authority.

Around the Day Schools, however, has gradually grown up a network of religious and social agencies: Sunday Schools, evening classes, temperance work, clubs and guilds, etc., so that in 1908 societies affiliated to the Ragged School Union numbered 138, thirty of whose properties are vested in the Ragged School Union Council as trustees. The majority have independent committees, some owning capacious suites of buildings, and all raising their own funds, aided by grants from the

central body. In these there is an aggregate attendance of 44,000 scholars, with seven crêches, sixty-nine Industrial Classes, 133 Institutes, thirty-seven Boys' Brigades, 219 Bible Classes, 106 Mothers' Meetings, 126 Bands of Hope, forty-two Penny Banks, and twenty-eight Clothing Clubs. Few teachers are salaried, and there are 4700 voluntary workers.

The Society was almost a pioneer of the system of Fresh Air Day-Trips for slum children and of Holiday Homes. It now owns beautiful buildings at Bognor, Bournemouth, Margate, Southend, Addiscombe, and supplies Princess Christian's Home near Windsor. To these mainly cripples are sent, of whom in 1908 fifteen hundred spent two or more weeks. A fortnight in the country was provided also for 6200 boys and girls, and a day's outing for nearly 200,000. Several independent societies for the supply of boots and clothing have been merged in the Shaftesbury Society, and in 1908, 77,000 garments and 28,000 pairs of boots were distributed on a gift-loan system. A valuable enterprise is the Cripples' Mission, which enrols in London 7400 disabled children under sixteen; gathers them in weekly Cripples' Parlours for instruction and amusement; supplies surgical appliances, spinal carriages, and other necessities; and tries to teach trades to some of the stronger.

The Society circulates annually many thousands of books and periodicals. It has in the last forty years presented 37,000 prizes for faithful service to young men and women who have remained in the same situation one, three, or five years. The total expenditure of the Society for the year ended March 31st, 1908, was £37,700. Official organ, *The Shaftesbury Magazine*, monthly, 1*d*. *Director*, Sir John Kirk, 32, John Street, Theobald's Road, London, W.C.

RAILWAY PROBLEMS: As a result of the great controversy in 1907 between the directors of the chief British railways and their employés, representatives of the companies and the unions agreed on November 6th, 1907, to a scheme of Conciliation and Arbitration Boards proposed by the Board of Trade. The intervention of the Rt. Hon. Lloyd-George, then President of the Board of Trade, at a moment when a long and disastrous strike seemed all but inevitable, led to a series of interviews with both parties, terminating in the acceptance of the principle of conciliation and arbitration. The general outlines of the scheme are: Boards for each company; grouping of employés in sections and districts; Sectional Boards to deal with groups of allied grades, each Sectional Board sending representatives to a Central Conciliation Board with power to settle questions remitted to it on the motion of either side; in the event of the Conciliation Boards being unable to arrive at an agreement, or either the company or the men failing to carry out its decision, reference to be made to an Arbitrator, appointed by agreement of parties, or, failing that, by the Speaker and the Master of the Rolls; the scheme as evolved to last for at least six years, after that be terminable only by twelve months' notice from either side.

Conciliation and Arbitration

In September and October of 1908, however, a strained situation again prevailed in connection with the making of reductions of wages and increases of work on the part of some of the railway companies, to which the men's representatives raised strong objection, pointing out that if they were prevented from striking for an increase of wages, they might still strike to prevent a reduction.

Owing to joint-working arrangements (see below), and other causes, there were unusually large dismissals in September and October, 1908, and considerable feeling was aroused among the men. According to one estimate, during the past ten months (to October, 1908), fifteen thousand railwaymen of all grades have been discharged, and twenty-three thousand placed on short time, and this staff-reduction is expected to continue until probably forty per cent. of the men have been dismissed.

While the 1907 crisis above referred to was in progress, Lord Brassey advanced a strong plea for the nationalization of the railways. Addressing the members of the Association of Chambers of Commerce at the annual meeting in Liverpool in September, 1907, he said—

Nationalization

"In English railway management competition is carried to excess. An immense capital is wasted on duplicate lines, and traders and railway workers complain. The latter say that their wages are too low and their hours too long, while the former assert that rates and charges are excessive. We are, perhaps, on the eve of a great change of policy. We see what is taking place in Continental Europe. The requirements of the public are fully considered. The results to the exchequer have been satisfactory. If we were taking a new departure to-day there can hardly be a question as to what Parliament would do. The capital value of railways may be taken roughly at twice the amount of the National Debt. To deal with interests so vast would be an operation which would heavily tax our financial resources. We might perhaps begin with State ownership in Ireland. The financial operation would be on a limited scale. The savings from unity of management would certainly allow of considerable reductions in rates and tolls. As to administration, there is no reason to apprehend failure. It is not the least of the advantages to be looked for from the change which I have ventured to advocate, that it would give to the State a field in which soldiers having completed their term of service with the Colours might find employment."

Lord Brassey's suggestion that "we might perhaps begin with State ownership in Ireland," is afforded considerable elaboration in a Fabian Tract on the subject. Setting out with the argument that Irish railway rates and fares are the highest in the world, the advantages of and the objections raised to the nationalization of railways are fully discussed, comparison being instituted with not only the English and Scottish lines, but also various Continental countries. The question of purchase is dealt with as follows:—

"The terms under which the State can compulsorily acquire the railways from the present companies are fixed by Mr. Gladstone's Act of 1844. This provides that the price payable shall be twenty-five years' purchase of 'the annual divisible profits, estimated on the average of the three next preceding years.'

"Let us see what sort of a bargain this will mean for the Irish railways. The average annual divisible profit for the three years ending 1898 amounted to £1,521,717. Twenty-five years' purchase of this will give £38,042,925 as the price of acquisition by the State. This is just £1,300,000 less than the paid-up capital value of all the Irish railways. The Government would be easily able to get their State Railway Stocks taken up at 2½ per cent. But against this, a big saving in working expenses, consequent upon unity of management, would be effected. A late manager of one of the English railways has estimated this saving at twenty per cent. This will give us an annual saving of £414,000. Thus—

Present profits	£1,521,000
Saving by unity of management ..	414,000
	£1,935,000
Less annual interest of 2½ per cent. on Government railway stock of £38,042,925	951,000
Leaving a net annual profit of	£984,000
With this sum, goods rates and passenger fares could be reduced by twenty per cent.	706,000
Still leaving	£278,000

to form the nucleus of a sinking fund, and to improve the conditions of the Irish railway servants. Of course, the reduction in goods rates and fares would soon more than recoup itself in increased traffic. It should be clearly borne in mind that there will be no need to raise a single halfpenny of the purchase-money by taxation. The process will be one of simple conversion. Upon a given day a State scrip will be substituted for the existing stock certificate. If shareholders desire to have cash they will simply sell the Government scrip as they sell consols to-day."

"Some of the Advantages of a State Railway System" are set forth by Mr. A. Emil Davies in his *Nationalization of Railways* (1908). These include

Another View

cheaper fares, lower goods rates, uniformity of charges, etc., co-operation between the Post Office and the railways, and better railway stations. He points out that fares and rates on the railways of the United Kingdom are very much higher than on the State-owned railways of the Continent, and that with the existing wasteful administration these charges must be high if they are to yield even a meagre return to the shareholders. There is even greater necessity, he maintains, for cheaper goods rates, ours being far and away the highest in the world, and bearing most hardly upon trade and industry. And as the companies would sooner or later be compelled to raise wages, the steady rise of these rates would continue, since the railway companies would do their best to recoup themselves at the cost of the traders. He lays particular stress upon the want of uniformity in charges on the various British lines as strongly supporting the plea for a State system, when rates would be graduated according to distance. Again, in countries where the State owns the railways, the two great allied services work hand in hand, greatly to the public convenience. Lastly, he compares the railway stations of this country with those of Continental countries, much to the disadvantage of the former. With nationalization of the railways, a vast amount of rebuilding would have to take place, which, as it would make for greater efficiency and economy in working, would be money well spent.

Fabian Tract (No. 98), above referred to, says—

"The question as to whether the cost of administration is greater under State or private management is one of vital importance. The proper basis of comparison for this purpose is, of course, the cost of administering, not a State line in one country with a private line in another, but the State and companies' lines respectively, side by side, in the same country. And this comparison has been most effectively made by Mr. J. S. Jeans. He gives this comparative statement, showing the percentage of total working expenses expended on administration on the State and private lines respectively of different European countries :—

Countries.	State lines.	Companies' lines.
	Per cent.	Per cent.
Germany	9·40	13·10
Austria-Hungary ..	6·50	8·47
Belgium	5·05	10·13
Denmark	6·89	5·77
France	16·16	9·58
Italy	6·49	8·76
Norway	7·30	7·00
Holland	5·30	10·35
Roumania	4·40	10·80
Russia	9.27	13·70

"The State railways of Belgium have proved a great success in every respect—in cheapness of rates, in efficiency of service, and as an investment of public monies. While up to 1894 the State lines cost £32,000,000 to construct, they earned a net profit of £60,000,000, or just double their cost price."

There have been at intervals plans for the amalgamation of lines. The South-Eastern and the Chatham and Dover Railways have now been working as one for some years. In December, 1907, an agreement was arrived at between the Great Northern Railway and the Great Central Railway to pool interests and work under a joint Committee, but other railway companies dissenting, sanction was not given. Not to be denied, however, the directors of the Great Central and Great Northern Railways now propose to include in the combination the Great Eastern Railway. These three companies, representing a capital of over £160,000,000, have decided to seek Parliamentary powers with a view of entering into a working agreement based upon arrangements similar to those proposed, in the first instance, by the two first-named concerns. It is intended to introduce a Bill early in 1909. The London and North-Western and Midland have also entered into "an arrangement of a comprehensive character, to endure for a long period of years, which will, it is hoped by the promoters, be the means of enabling considerable economies in working expenses to be effected." The capital of these two companies amounts to over £320,000,000.

Amalgamation

This agreement has already been put into operation, and the officials of both companies say that the public, so far from losing by the agreement, will gain considerably. In addition certain companies have agreed as to the running of competitive trains, especially to Scotland, and a reduction of service has resulted.

In the report of the Amalgamated Society of Railway Servants as submitted to the Annual General Meeting, October 5th to 9th, 1908, the recent attempts at amalgamation and the pooling propositions are discussed. Mr. Richard Bell, J.P., M.P., the General Secretary, writes thus: "It is quite patent that railway companies are at last beginning to realize the disastrous nature of 'cut-throat' competition. Co-operation is just as essential for railway companies as it is for any other form of enterprise. Even now, however, there is bound to be a certain amount of competition, but should this eventually result in the formation of a huge railway trust, then it would undoubtedly be a question for State interference."

Before the British Association in September, 1908, at Dublin, Mr. W. M. Acworth, a well-known authority and writer on the subject, delivered an address on the State and Railways.

"One could not look round the world," said Mr. Acworth, "and fail to recognize that the connection between the railways and the State was everywhere becoming more intimate year by year. It seemed to him that both in England and in America we must expect to see in the near future a considerable development of Executive Government control over railways. We must assume, in view of recent combinations, that competition, which had done good work for the public in its day, was practically ceasing to have any real operation in regulating English railways."

The London *Daily Chronicle*, on the other hand, believes that "Competition of this character can cease without jeopardy to any public or trading interest. It is time the railway companies adopted a more rational policy. We are not apprehensive of the creation in this country of a great railway trust."

That the prospects of amalgamation are not very distant, is maintained by some writers to be proved by the remarkable reduction in trains which took place on the principal lines in October of 1908. Thus the London and North-Western Railway took off 137 trains, the London and South-Western Railway 112 trains, the Great Central Railway 58 trains, the Great Northern Railway 90 trains, the South-Eastern and Chatham Railway 230 trains, and

Reductions

the Great Eastern Railway 112 trains; and other well-known lines, such as the Great Western Railway, Midland Railway, London, Brighton and South Coast Railway, North-Eastern Railway, etc., have also in arrangement appreciable service reductions.

The railway companies, however, maintain that no undue interpretation can be read into this reduction of trains. Thus a prominent official of the South-Eastern and Chatham Railway, interviewed on October 5th, 1908, stated that in their case a number of relief trains put on in summer time to cope with extra traffic running a few minutes after the scheduled trains were shown in public time-tables in the 1908 summer season for the first time, and consequently in stopping these as well as the ordinary season trains, the disparity appears much more than in previous years, when the relief trains—though in service—did not appear in the public time-tables.

In view, therefore, of the outlook, the following table will be of interest as representing the position of railways in the United Kingdom :—

RAILWAY TRAFFIC RETURNS.

Particulars.	1907.*
Miles open	23,101
No. of locomotives	22,267 †
,, passenger vehicles	51,846 †
,, other passenger train vehicles	19,739 †
,, goods, mineral, and live stock waggons	731,639 †
,, other vehicles not included in above	20,215 †
,, passenger train miles	262,340,000
,, goods ,, ,,	164,350,000

* The figures shown for 1907 are given from the Preliminary Summary, and are subject to revision in the Annual Returns of the Board of Trade, which had not been issued at the time of going to press.

† 1906 figures, later data being unobtainable at time of going to press.

WEEKLY EARNINGS OF RAILWAY SERVANTS (including building and repair shops and all workers). Compiled from the Annual Reports of the Board of Trade on changes in wages and hours.

Year.	England and Wales (15 Companies).		Scotland (5 Companies).	
	Number employed.	Average wages per head.	Number employed.	Average wages per head.
		s. d.		s. d.
1907 ..	412,804	26 4¾	46,416	23 5½

Year.	Ireland (7 Companies).		United Kingdom (27 Companies).	
	Number employed.	Average wages per head.	Number employed.	Average wages per head.
		s. d.		s. d.
1907 ..	19,470	19 8¼	478,690	25 10

Owing to the evidence given at the inquiry into the disaster in the winter of 1907 to the Shrewsbury express the numbers of railway men working over twelve hours per day is valuable.

According to a Board of Trade return issued in September, 1908, 112,198 railway servants worked 2,663,359 days in April, 1908, the number of days on which the men were on duty for periods exceeding twelve hours by one hour and upwards amounting to 0·99 per cent. of the total days worked.

	1908.	
Passenger guards and brakesmen worked	2083	Hours in total over 12 hours a day.
Passenger enginemen	2231	
Goods guards and brakesmen	2029	
Goods enginemen	6984	
Signalmen	1034	
Examiners	393	

It should be explained that these figures, showing the periods of duty, are exclusive of time, if any, spent in travelling home after relief. They show a distinct improvement on the 1907 figures.

The total number of accidents to railway servants is still very great.

Year.	Killed.	Injured.	Total casualties.
1906	483	16,256	16,739
1907	509	21,514	22,023
Increase ..	26	5,258	5,284

During 1907 one casualty occurred among every fifty-seven railway servants exposed to danger, as compared with one in every seventy-one, the average of the ten years ending 1906.

The general casualty list of the railways, according to the Board of Trade return of railway accidents in the United Kingdom for 1907, shows that in the running of trains and the movement of railway vehicles 1117 persons were killed and 8811 were injured. As compared with 1906 there was a decrease of fifty-two killed but an increase of 1599 injured.

Another return for the first quarter of 1908 shows that 252 persons were killed and 2218 injured in the course of public traffic.

It was stated at the Mid-city Hall, Glasgow, on October 5th, 1908, that the membership of the Amalgamated Society of Railway Servants was nearly 99,000, and the total funds £400,000, and the possibility of an amalgamation among all the societies representing railway servants was put forward in the report.

A new "masters" organization, the Railway Shareholders' Association, was formed in January, 1908. This body held its first half-yearly conference in London on July 8th.

RATIONALIST PRESS ASSOCIATION, LTD., THE: Founded in 1899. Object: To stimulate freedom of thought and inquiry in reference to ethics, theology, philosophy, and kindred subjects, and to promote a secular system of education. Semi-official organ, *The Literary Guide*, monthly, 2*d*. Chairman, Mr. Edward Clodd. *Secretary:* Mr. Charles E. Hooper, 5, Johnson's Court, Fleet Street, London, E.C.

REFORMATORY AND REFUGE UNION: Founded in 1856. (Incorporated.) Object: To reclaim and elevate the neglected and criminal classes, by educating them in the fear of God and in the knowledge of the Holy Scriptures. There are twelve hundred affiliated institutions, affording accommodation for about 78,000 inmates. A large staff of officers, male and female, registered also as "Probation Officers," seek to save children from destitution and neglect, to rescue girls from moral danger, and to befriend those who have left the schools and other institutions. Since the Union was established 49,383 children have passed through the hands of these officers; 45,594 women and girls have come under the influence of the female missionaries, and 352 persons have been befriended on their discharge from inebriate reformatories or retreats. Official organ, *Seeking and Saving*, monthly, 2*d*. President, Lord Aberdare. *Secretary:* Mr. Arthur J. S. Maddison, 117, Victoria Street, Westminster, London, S.W.

"RIGHT TO WORK" BILL: (See under UNEMPLOYMENT.)

ROADS IMPROVEMENT ASSOCIATION: Founded in 1886. As the result of pressure brought to bear upon the Government and the departments concerned, a Departmental Committee was appointed by the Local Government Board to inquire into Highway Authorities and Administrations in England and Wales. Recommendations were also made on the subject by the Royal Commission on London Traffic and the Royal Commission on Motor Cars. A Highways Bill has been prepared to give effect to the principal of these recommendations. The dust problem has received the special attention of the Association, the tarring of the roads having so far proved the most efficient palliative for laying dust. It was foreseen that the cost of tarring must be reduced considerably before it could be adopted, the Association therefore organized a competition, at the request of the Royal Automobile Club, and the Motor Union of Great Britain and Ireland, to determine the best means for mechanical tarring; and another competition to determine the best form of tar or preparation of tar suitable for road purposes. Resulting from a Conference of Road Engineers and Road Users, organized by the R.I.A. in July, 1907, a committee was formed to approach the Government with a view to securing the allocation of one million pounds from the exchequer as grants-in-aid to various local highway authorities to enable them to meet the increasing expenditure in the construction, maintenance, and improvement of their roads. President, The Right Hon. Earl Cadogan, K.G. *Hon. Secretary:* Mr. Rees Jeffreys, 1, Albemarle Street, Piccadilly, London, W.

ROMILLY SOCIETY: Founded in 1898. Object: For the amendment of the Criminal Law and its administration. President, Lord James of Hereford. *Secretary:* Mr. Coleman Phillipson, M.A., LL.D., 1, Mitre Court Buildings, Temple, London, E.C.

ROWTON HOUSES: The philanthropic enterprise known as Rowton Houses, Ltd., was initiated by Lord Rowton early in the last decade of the nineteenth century, the first building erected being the Vauxhall Rowton House, which was opened on December 31st, 1892. It contained 470 cubicles, subsequently increased to 484. Within a short period from the opening of the house it was practically filled, the experiment turning out a complete success. Lord Rowton perceived the necessity of some provision being made better than the common lodging-house, alike on the grounds of comfort, sanitation, and sociological betterment, for men who were unable to occupy rooms of their own, namely, a cheap hotel, where the poorer class of working man could live and enjoy every possible convenience, with separate bedroom accommodation for each man and comfortable rooms for eating and recreation. The Vauxhall house, which cost in land and building £30,000, was accordingly erected on these lines, and its success soon led to similar provision being made in the direction of hotels for working men in various parts of the Metropolis. The number of Rowton Houses is now six, containing beds for 5182 men. The general charge for a cubicle is 3*s*. 6*d*. per week, or sevenpence a night. Residents have free use of the following rooms: Dining-room, where food can be purchased at exceptionally low prices, convenient fires and cooking requisites being provided free for those who wish to prepare their own food; smoking-room, with newspapers, chess, draughts, etc.; reading and writing rooms, with plentiful supply of books, magazines, etc. Hot and cold baths are also provided at a charge, including soap and towels, of one penny. Further, there are barber's, shoemaker's and tailor's shops, laundry, parcels room, and a plentiful supply of lockers. All bedrooms must be vacated before nine o'clock in the morning. Rowton Houses, Ltd., has a share capital of £450,000, with six houses, situated in various parts of London, *i.e.* Vauxhall, King's Cross, Newington Butts, Hammersmith, Whitechapel, and at Camden Town. The fourteenth annual report, for the year ended December 31st, 1907, showed that the gross receipts for that period amounted to £60,998 16*s*. 5*d*., an increase of £2,342 17*s*. over the corresponding figures for 1906; the total outgoings being £47,379 9*s*. 8*d*., or £2426 16*s*. 3*d*. larger than in 1906; and the net profit for the year, £13,619 6*s*. 9*d*., a decrease of £83 19*s*. 3d.

Registered offices: 7, Little College Street, Westminster, London, S.W.

On similar lines are the municipal lodging-houses inaugurated by the London County Council, such as Bruce House, Drury Lane, and Carrington House, Deptford.

RURAL DEPOPULATION: (See under SMALL HOLDINGS.)

RURAL HOUSING: (See under HOUSING AND TOWN PLANNING.)

RURAL HOUSING AND SANITATION ASSOCIATION, THE: Founded in 1902. Object: To improve the condition of housing and sanitation in country working-class homes throughout England, to prevent the rural population from being driven into towns by the inadequacy and unwholesomeness of their habitations. The Association has branches in Cambridgeshire, North-west Sussex, and East Sussex. President, The Marquis of Salisbury, C.B. *Secretary:* Miss Annette Churton, Parliament Mansions, Victoria Street, London, S.W.

RUSKIN COLLEGE: Founded at Oxford in 1899. Object: To make available a school of citizenship and public administration for working men. The College has been well filled since its foundation, and during the last eight years 397 students have been in residence, the greater number for a year. That these students are really working men can be seen from the following list for 1908: Miners 28, engineers 6, locomotive firemen 2, compositor 1, brakesman 1, signalman 1, bricklayer 1, weavers 3, carpenters and joiners 2, coach builder 1, passenger guard 1, steel smelter 1, pattern-makers 2, sheet metal worker 1, brass moulder 1, boiler-maker 1, cotton operative 1. The various Trades Unions, etc., have made individual financial and other grants to the College at various times up to the amount of £300 at a time.

For £52, board, lodging, and tuition is provided for each student for the college year, and each student has to do a share of the house-work. There are no servants except a cook, and an assistant. The hope of the institution is that each man, by raising himself, may help to raise, by influence and precept, the whole class to which he belongs. This hope has been amply fulfilled. Not a single working-man student who has passed through the College has failed to return to his trade. Students throughout the country to the number of 7500 are enrolled in the Correspondence School. The Council embraces University men and representatives of Trades Unions in about equal number. *Secretary:* Mr. Bertram Wilson, Ruskin College, Oxford.

S

SCHOOL CHILDREN, FEEDING OF: As will be seen from page 488, France, and in lesser degree other countries on the Continent, have long had in operation plans for the feeding of school children. In England this matter has lately received greater attention. A committee appointed by the Government held inquiry and reported in July of 1906. This resulted in the Act of 1906, whereby Education Authorities may, if they think fit, provide free meals for children attending their elementary schools. They are not compelled to do so. A point to be noticed in the Act is that parents are compelled to pay if it is found that they are able to do so. Under the consent of the Board of Education, Authorities may make a charge on the rates for the feeding of school children up to a sum not exceeding one halfpenny in the pound. For some years previously the provision of breakfasts and dinners for necessitous children was carried out by the teachers, or by local committees who were supplied with funds by certain voluntary associations, principally the London Schools Dinner Association (*q.v.*).

In July of 1907 the Education Committee of the London County Council appointed Children's Care Committees for every school in London where there were underfed children. No less than four hundred of these committees were in operation by January, 1908. The usefulness of this scheme may be gauged by the following summary of one week's return (January 10th, 1908):—

Number of schools reported as having necessitous children	390
Number of children therein	36,474
Number of schools where children were fed	362
Number of children fed	30,319
Average number of meals per child	2·9
Average number of days on which meals were provided	3·7
Number of schools reporting insufficient funds for the next four weeks	135
Number of schools at which the meals provided averaged less than three per child	152

Its growth is seen by the following aggregates for the week ending February 21st, 1908, as compared with the same week of the previous year:—

	Children fed.	Schools where provided.
1908	43,931	443
1907	30,635	302

Voluntary Effort

Although the Act of 1906 (Provision of Meals Act) gives freedom, as seen above, to local education authorities making a levy on the rates, the London County Council, on July 30th, 1907, decided that voluntary contributions should be relied on. The *Times* of July 8th, 1908, gives a succinct history of subsequent action and expectation in the matter: "In the autumn of 1907 the Chairman of the Council issued an appeal; and when in December it became evident that the response to this appeal would not provide sufficient funds, a further appeal was made in the Press by Lord Rothschild, Lord Rosebery, Lord Avebury, and the Rt. Hon. A. J. Balfour. The total sums collected were, approximately—by existing voluntary associations £8000, and in response to the special appeal £12,000, to which a sum of £1000, representing various local collections, must be added, making a total of £21,000. Of this £12,000 raised by the special appeal, about £10,000 has been expended. The distress in London during the winter of 1907 was great, and the number of children fed in some weeks exceeded fifty thousand. It was not anticipated at the beginning of the winter that meals to any considerable number would be needed during the summer; but as matters have turned out, for the week ended June 26th, 1908, 214 schools have reported the feeding of 7667 children. The Council's Education Committee reported in June, 1908, that with better organization and fuller investigation, coupled with the Council's power to recover the cost of food supplied, the numbers on the feeding list may reasonably be expected to be appreciably diminished during the coming winter, when compared with the number fed per week last winter. Against this, however, must be placed the provision of a greater number of meals per child during the autumn months and the possibility of greater distress through depression in trade. It is estimated, therefore, that from £20,000 to £25,000 should be available to meet the requirements of the coming year (1908-9)."

The view taken by Socialists of the question is expressed in the report of the Fabian Society Committee issued in January, 1905: "Our own solution is that all children, destitute or not, should be fed, and fed without charge, at the expense of the State or municipality. We propose that the regular school course should include at least one meal a day. Thus only can we make sure that all the children who need feeding will be fed. Thus only can we free the policy of feeding from the taint of pauperism. Thus only can the problem of improper feeding be dealt with at all."

The adoption of the Provision of Meals Act by the Bradford Education Committee was given special prominence in the issue of the *New Age* for October 3rd, 1908, which in an article on the subject detailed fully the committee's action. Particular reference was made to the establishment at Thackley, to which the municipal tramcars convey the children from the city's centre. Here breakfast, dinner, and tea are provided, with plenty of play and rest as required. This open-air school accommodates forty

children, among whom the beneficial results of the committee's policy soon became apparent in physical and mental improvement.

SCOTTISH LAND VALUES BILL: (See under LAND VALUES.)

SHAFTESBURY SOCIETY: (See RAGGED SCHOOL MOVEMENT.)

SIMPLIFIED SPELLING SOCIETY: Founded in September, 1908. Object: To bring about the gradual reform of English spelling. President, Professor W. W. Skeat, Litt.D., etc., Cambridge. *Secretary:* Mr. William Archer, 44, Great Russell Street, London, W.C.

The Society co-operates with the Simplified Spelling Board, founded in the United States in 1906, of which the President is Professor Thomas R. Lounsbury, LL.D. *Secretary:* Mr. Charles P. G. Scott, Litt.D., 1, Madison Avenue, New York City.

SMALL HOLDINGS: The question of small holdings, previous to 1906, was not one to engage general public attention, but, to quote Mr. Rider Haggard (1907), "the public have come to realize how necessary it is that the land should be in more hands than it is at present."

Mr. H. Rider Haggard

Rather earlier, Mr. Rider Haggard dealt at length as below, with the land depopulation question, arguing before the Royal Institute that the cure lay in small holdings:—

"My subject is the difficult and debated question of small holdings; their relation to national health and well-being; and their working in practice.

"Speaking broadly, although of course its physical conditions are the same, the England of the past must have been a very different country from that with which we are acquainted to-day. Then, the land was the main strength of Britain, now commerce is its strength. Then, we were land-dwellers and the towns were small; now the great bulk of us are city-dwellers, most of whom know nothing of the land, and, as it does not concern their purses or their plenty, are absolutely indifferent to its welfare.

"The yeomen, too, who once formed the very backbone of the nation, have gone. The class of agricultural labourers is in much the same case. Thus, as is pointed out in the final report of the Royal Commission on Agriculture published in 1897, the population of Great Britain between the years 1871 and 1891 increased by nearly seven millions, whereas the agricultural labourers of Great Britain during the same period decreased by about 242,000. I have not at hand the figures for the decade between 1891 and 1901, but if I may trust to the results of my own knowledge and observation, I believe that decrease to have been progressive. I read in fact, that in England and Wales their number has further dwindled by about 160,000. Also I think that I am right in saying that the 1901 census shows a shrinkage of the population in no less than 401 of the rural districts of England and Wales. When it is remembered that in 1891 about seventy-seven per cent. of their inhabitants were already living in cities or their suburbs, as against twenty-three per cent. living in the country, it will be admitted that this fresh depletion of the villages is a very significant fact. A lessening of the number of agricultural labourers and shepherds from 1,253,786 in 1851 to 620,000 in 1901 can scarcely be ignored.

"To come to more modern instances of a population that has vanished, I will quote two examples which I was fortunate enough to be able to discover. The first of these was demonstrated by a map that I saw of the parish of Feckenham in Worcestershire, which was executed by the order of Queen Elizabeth at the date of the Disforestation in 1591—or to be accurate, I saw a copy of this map made by one John Dobarte in 1744. According to this chart, in the days of Elizabeth three thousand out of about seven thousand acres which compose the parish, were held by no fewer than sixty-three different owners. To-day nearly the entire parish—namely, six thousand acres of it—is held by six owners. It is a curious case of the passing away of the land from the people into the hands of a single class.

"In the parish of Western Colvile in Cambridgeshire I came across an even more remarkable example. Here I was shown a large detailed map executed in 1612 which had been found by the owner of the land hidden away in a cottage. This map tells us in unmistakable fashion that in 1612 about two thousand acres of the area of Western Colvile were held by some three hundred different owners—say an average of six acres to an owner. Now the said two thousand acres, over which I drove, is, I think, owned by one person and occupied by three, and the tiny strips into which it was divided are merged into vast, lonely fields.

"Now, owing to many causes they have for the most part vanished. Nor has the land and the industry of its cultivation prospered of late years. According to an estimate arrived at by the Royal Commission on Agriculture some few years ago, the value of that land in the United Kingdom decreased between the years 1875 and 1895 by some £834,000,000, or fifty per cent., although since then it may again have risen a little. Then the character of the husbandry throughout England, or at least in most of the twenty-seven counties in which I pursued my investigations, has, I believe, in the main deteriorated. Tenant farmers in the main are not what they were thirty years ago. Their capital is not so large, their energy and enterprise are often less; notwithstanding the great fall in rents, their prosperity on the whole has dwindled. But few of them make more than a living. Still, the tenant of land has not been so hard hit as the owner of the land, who is oppressed by tithe, taxes and death duties, all of which we must meet out of an enormously lessened income. In some counties his acres are now frequently let for not more than a fair interest on the capital value of the improvements effected on them by himself or his predecessors, that is to say, the land itself is thrown in for nothing. And all this, be it remembered, has come about in a country full of the finest markets in the world, that clamours for produce and imports it from abroad to the value of millions upon millions of pounds annually; a country, moreover, where irrigation is not needed, and of which the soil, if fairly treated, remains of unimpaired fertility. What is the reason of this strange state of affairs to which there seems to be no obvious and sufficient answer? Is it national senility? I think that we must look further afield.

Large Estates

"For instance, has not our system of large estates something to do with the matter, our rooted and almost ineradicable notion that the holding of land is mainly a right of the rich to be used by them for the purposes of pleasure and not of profit?

"Would not matters be improved if more individuals held less land and worked it themselves to earn a living out of it, thus getting rid of one of the three profits that it has to bear?

"The question is large, yet it may—at any rate to some extent—be dealt with by contrast. When I was engaged upon my researches, I visited Jersey and Guernsey, places with some agricultural advantages, though these are by no means so pronounced as is perhaps generally imagined.

"In the Channel Islands the land system is totally different from our own. Thus, real property, on the death of the head of a family, must be divided among all the children in certain proportions, the eldest son by virtue of his prior birth having only an extra right to the principal house and some twenty perches of land. Consequently there are a multitude of small freeholders, the average holding in Guernsey amounting to about one acre only, and in Jersey to fifteen or twenty, many there being under ten and few over fifty. If we are to believe half of what is preached to us as to the disadvantages of such holdings, this state of affairs should mean misery to all concerned.

"And yet what are the facts, unless they have changed since 1901? In Guernsey, land to be used for agricultural purposes fetches as much as £500 an acre, and lets at from £4 to £9 the acre. In Jersey I saw a little farm of about twenty-three acres which had been sold not long before, also for agricultural purposes, for £5760. Compare this state of affairs with that which prevailed at that date in Wiltshire, where land sells often enough for £6 the acre, and lets at from 5s. to 15s. the acre. Yet, in the Channel Islands, the people are, as a whole, extraordinarily prosperous, and often accumulate fortunes.

"Now does not all this suggest that there is perhaps something to be said for the tenure of the land by the people instead of by a very limited class, and that it is better to cultivate one acre thoroughly, making it produce as much as it possibly can, than to treat ten or twenty in the fashion that is common enough in England?

"With regard to the peril of corn shortage, if, by wars, our foreign supplies were stopped, I think it was that shrewd observer, Prince Kropotkin, who demonstrated that if the soil of this country were only cultivated as it is on an average cultivated in Belgium, we could produce as much as our people need to eat, and have some surplus over. Prince Kropotkin is right, at any rate, to a large degree, and that if our acres were cultivated as they might be cultivated by the aid of sufficient energy, capital, intelligence and labour, the produce from them of all foodstuffs could be well-nigh doubled.

"There are two great national needs. The need of increasing the numbers of our rural population, and the need of increasing the productive powers of our land—which needs, in my opinion, are more or less dependent for their satisfaction upon each other.

"How can the rural population be increased? How even can the exodus from the countryside be stayed?

"The chief reason for the exodus townwards is, in my opinion, a lack of prospects if they elect to stay at home.

"The prospect that they require, I take it, is that of being able to lift themselves up in life, of being able to farm land on their own account, upon however small a scale, and of ending their days living on their own means.

"At present, in most cases, this is an impossibility for the agricultural labourer, but I hold that it should not be so, and that it need not be so.

"Where small holdings exist the exodus from the land is comparatively little; labour is more plentiful; there are more children; the production from the land is larger; and an altogether better and more hopeful tone prevails than is the case elsewhere.

"If these things are true—and I believe them to be true—it follows that it is well for England to multiply small holdings, and that it ought to be the object of all sound statesmanship to multiply them accordingly."

Various Acts have passed dealing directly or indirectly with the Small Holdings questions, notably the Allotments Act, 1887, the Allotments Act, 1890, the Small Holdings Act, 1892, the Local Government Act, 1894, the Land Transfer Act, 1897, the Small Holdings and Allotments Act, 1907, and the Small Holdings and Allotments Act passed in August, 1908 (in operation from January, 1909). This last Act in essence adopts the intentions of the earlier enactments, which are thereby repealed.

Earl Carrington, the President of the Board of Agriculture, is largely responsible for the progress of the small holdings movement. On his estate near Spalding in Lincolnshire, twenty years ago, he formed allotment clubs among the labourers, who paid for their land by weekly subscriptions. On the passing of the Small Holdings Act in 1892, a County Council experiment with eighty-eight acres purchased from Lord Carrington, and let out into one- to three-acre plots was so successful that later an association was formed to whom 217 acres of land on the Carrington estate were let. This acreage steadily increased, till at the end of 1906 the association had control of 650 acres at a rent of £1018. It holds the land on a twenty-one years' lease, has over two hundred tenants, lets the grassland at 36*s.* to 45*s.* per acre, the arable at about 35*s.* per acre, and any land falling vacant has fifty applicants for taking it up.

Earl Carrington

A national demonstration took place in London on April 20th, 1907, in favour of land and housing reform, at which the Rt. Hon. Winston Churchill outlined the then prospective legislation on small holdings. He considered that the acquisition of compulsory powers for obtaining land would in itself be a very potent lever for bringing suitable land into the market at a fair market price. On the same occasion, the late Rt. Hon. Sir H. Campbell-Bannerman, in the course of a lengthy speech, said: "With regard to small holdings, the subject has been sometimes so handled as rather to suggest that it is an exotic growth, to be cultivated by philanthropists and amiable faddists. That is a complete misconception, as every one will know who has observed the conditions under which agriculture has been carried on over the greater part of the continent of Europe. In England upwards of half of the actual number of farmers are small holders at present—that is to say, they are in occupation of holdings of between five and fifty acres. But there are not enough of them. There is a whole mass of official testimony to show that a strong demand for this type of holding exists in many parts of the country, and if only this demand could be satisfied, the young men and the best men in the villages, instead of setting their faces in despair towards the town, would be glad to remain at home. We hear of this unsatisfied land hunger very largely in the East of England, we hear of it in the Midlands, we hear of it in the southern counties. Lord Carrington, in his administrative capacity as Minister of Agriculture, has been laying the foundation for small holdings on Crown lands, and he looks forward in a year or two to seeing hundreds of families settled and thriving under his wing. But in a matter of this sort we cannot leave anything to chance. It is essential that compulsory powers as simple, swift, and extensive as can be contrived, should be vested in the local authority, so that machinery can be set up for securing what is desired."

The Rt. Hon. Earl Carrington, at the same gathering, said that for thirty-nine years he had preached from two texts: (*a*) A good tenant should be protected from a bad landlord, and *vice versa;* and (*b*) Small holdings for agricultural labourers and others should be secured compulsorily, if necessary, by local authorities, and, if these failed in their duty, by a central authority. As regards tenants and farmers, they had passed the Land Tenure Bill. They were now face to face with the agricultural labourer, the most pathetic figure in their social system. They should be told, of course, that they threatened the rights of property. But for fifteen years the country had gone on trusting the voluntary action of the county councils, and at the end of it all they saw the agricultural population still declining, and the labourer without the possibility of a career, and too often without the chance of getting even a decent home. The present state of affairs was even less favourable in many respects than in the eighteenth century before the commons were enclosed and the yeomen destroyed. In the Small Holdings Bill, he contended, a way had been found to deal with what was at present a grave national danger.

The Act

The Act which came into force on January 1st, 1908—"Small Holdings and Allotments Act, 1907"—may be epitomized as follows:—

Allotments to be of any quantity of land up to five acres.

Small holdings to be of any quantity of land up to fifty acres.

Parish councils, if required, to provide for allotments of one acre, but they have the power to provide five acres with the consent and approval of the county council.

The county council to provide small holdings up to fifty acres, and to see that allotments are provided.

The parish council and the county council failing to satisfy the reasonable demand of parishioners, the said parishioners should appeal to the two commissioners appointed by Government, who have power to deal with this matter.

The county council, in supplying the demand for small holdings, can either buy land by agreement or hire land by agreement; buy land by compulsion or lease land by compulsion.

Parish councils, for the supply of allotments of one acre, have exactly the same power as the county council for obtaining land.

Parish councils are bound to supply allotments of one acre, always provided the applicants are considered to be fit and proper persons.

Money may be borrowed for the purchase of land, either by the parish council or county council, at 3½ per cent., repayable in eighty years; for instance, a loan of £100 is repayable in eighty years at 15*s.* 3*d.* per annum.

£100,000 placed by the Government at the disposal of the Board of Agriculture between January and March, 1908, with the promise of more to follow, to cover the working expenses in carrying out this scheme.

In cases of compulsory hiring, the rent to be paid, and other matters to be settled not by an arbitrator but by a valuer. The elaborate procedure of the Lands Clauses Acts is thus got rid of, and there is no ten per cent. or other allowance for compulsion.

Compulsory Powers

Voluntary bodies will probably take an important part in future in the provision of small holdings and allotments, following the experience of other countries. Special provision is made in the Act for their formation, encouragement, and support.

County Councils may promote the formation or extension of societies on a co-operative basis, to provide or work small holdings or allotments, and they may assist them by giving guarantees or making grants or advances to them.

The Board of Agriculture has still wider powers, for it may make grants out of the Small Holdings Account to any society for the promotion of co-operation in connection with the cultivation of small holdings or allotments.

Less than a month after the passing of the Act, which came into operation on January 1st, 1908, a noteworthy

speech was made by Earl Carrington, who maintained that the Small Holdings and Allotments Act offered to the labourer a ladder by which he could raise himself from his humble position of wage-earner to that of tenant. Instead of there being no demand for land, as had been foretold, he had received applications from forty-five counties. He had not totalled the amount required, but from eight counties alone the total applied for was 41,000 acres, which had been applied for by 2713 applicants. In addition he had received applications from the Crown lands for twelve thousand acres more. This represented eighty-three square miles applied for by eight counties and the Crown lands as well. That meant that a strip of land in England had been applied for, one mile wide, which would reach from the statue of King Charles I. at Charing Cross to Salisbury Cathedral in Wiltshire. That was the demand for the three weeks during which the Act had been in force. He did not say that all the applicants would be eligible. But he would like to say that among them there were 307 men who had asked for, practically speaking, ten thousand acres of land. They stated that they owned £25,700 capital, and in addition they had 1719 head of stock. Surely that justified the Act.

In the Counties

All over England the Act revealed a prevalent "land hunger." The experiences of the following county councils during the first three months after the operation of the measure may be cited as examples :—

Bucks.—6594 acres applied for by 330 applicants. 1637 arable and 4957 pasture asked for. County Council Small Holdings Committee (co-optive) of twenty-four members.

Devon.—5329 acres applied for by 310 applicants. Difficulty to get land.

Gloucester.—331 applications; the majority of the applicants personally satisfactory.

Essex.—5341 acres applied for by 313 applicants. Sub-committee (co-optive) of thirty-six appointed, with full powers. Decided to hire rather than purchase land.

Isle of Wight.—1026 acres applied for by fifty-five applicants. Several offers of suitable land received.

Kent.—9800 acres applied for. Seven valuers appointed.

Lincolnshire (Kesteven).—1596 acres applied for by 104 applicants. Decided not to erect buildings on less than twenty-five acres holdings.

Lincolnshire (Holland).—490 applications received. The acreage of the approved applicants amount to 5040 acres. Swineshead Parish Council received permission to borrow £1070 to purchase eighteen acres.

Monmouth.—Numbers of applications received. Newport Corporation report applications for over five hundred acres (chiefly required for grazing purposes) from dairymen.

Norfolk.—18,329 acres applied for by 1166 applicants. Ringland Parish Council decided to obtain compulsory powers to purchase thirty-one acres.

Oxford.—Ten thousand acres applied for by 518 applicants.

Somerset.—23,007 acres applied for by 1738 applicants. County has been divided into six districts, and a small holdings sub-committee appointed for each district.

Yorkshire (North Riding).—Committee of forty members appointed. Application received from Kirkby Overblow Parish Council for compulsory powers to acquire land.

Worcester.—8087 acres applied for. Two societies have applied for land.

Cardiff.—1040 acres applied for by seventy-six applicants for small holdings. 72½ acres for allotments applied for by 854 applicants.

An interim report was issued in August, 1908, by the Board of Agriculture, detailing progress for the six months ended June 30th, 1908, and showing that over nineteen thousand persons applied for over 300,000 acres. So far as the information received by the Board goes, says the report, it is evident that a large proportion of the applicants are thoroughly suitable men, and that the amount of capital they possess is greatly in excess of what was generally anticipated.

A few typical instances are selected—

County.	Applicants.	Cash.
		£
Dorset	205	14,000
Herts	140	11,500
Herefordshire ..	130	9,000
Cheshire	180	26,895

In the case of Dorset, the applicants possess stock and implements besides cash.

Exaggerated Obstacles

The particulars supplied by the applicants show that only in a very small percentage of cases is there any desire to purchase small holdings, and they show also that the question of equipment, which has been commonly supposed would prove the great impediment to the creation of small holdings at a reasonable rent, has been very much exaggerated. In the great majority of cases the applicants do not ask for houses or buildings. The extent to which the original number of applications has been reduced after investigation varies in different parts of the country. In the Isle of Wight practically the whole of the applicants are regarded as being likely to prove suitable tenants. In Cambridgeshire the applications of 865 persons for 8203 acres were investigated, and the sub-committees have approved 673 applications for 5080 acres.

At June 30th, 1908, the report continues, rather over two thousand acres of land have already been acquired under the Act, and negotiations are in progress in many other counties. Cheshire County Council are negotiating for a thirty-five years' lease of 255 acres of Crown land and for land in other parts of the county. Cornwall County Council have purchased 146 acres near Bridgerule. The Holland County Council (Lincs.) have agreed to buy a farm of 285 acres at Deeping St. Nicholas, and the acquisition on lease for twenty-one years by the Wilts County Council of 452 acres at Mere from the Duchy of Cornwall for letting to a co-operative association, is under consideration. Bedfordshire County Council are negotiating for the letting of a farm of three hundred acres to a co-operative society at Biggleswade. By September, 1908, 21,000 applications for land had been received.

An example of the value of a small plot of land to the town dweller is afforded at Plumstead, South-East London. Under the provisions of the Small Holdings Act, 1892, the London County Council acquired land and let it in plots of over an acre to tenants who were compelled to subdivide and sublet these plots to the actual cultivators. In 1896 the Council acquired on lease thirteen acres of land at £2 10s. per acre. At the lowest lettings, these allotments produce £4 an acre, so it will be seen that it is a remarkably good investment for the London County Council.

As indicated at the opening of the present article, the new Act, which operates from January 1st, 1909, is a consolidation of previous measures into one Act for greater facility in practical working.

The Board of Agriculture, in August, 1908, with the sanction of the Treasury, granted £1200 for three years to the Agricultural Organization Society for the promotion of co-operation in connection with the cultivation of small

holdings, provided a similar sum is raised by subscriptions. If the subscriptions exceed that sum the grant will be proportionately increased up to a maximum of £1600.

On September 6th, 1908, the British Association, in the course of their session at Dublin, devoted a special session, under the presidency of the Rt. Hon. Sir Horace Plunkett, to the discussion of the small holdings question. On the invitation of Earl Carrington, President of the Board of Agriculture, 178 representatives of the county councils of England and Wales attended a conference held at Westminster Hall, London, on October 7th, to discuss the difficulties of working the Act, and the best methods of expediting progress. In a speech at the luncheon which took place later at the Hotel Cecil, Earl Carrington said the councils had proved conclusively the demand for land, and that the demand was not for ownership of land—less than two per cent. of the applicants wishing to buy—but for security of tenure, without an increase of rents on the tenants' improvements. Up to that date ninety-three schemes had been received and sixty-nine of them approved. Twelve thousand acres of land had already been acquired (not counting the considerable amount of land let by landlords direct to small holders), and half of it would be available for occupation on Michaelmas next, four thousand on the succeeding Michaelmas, and the remainder by the following Lady Day and Candlemas.

SMALL HOLDING SOCIETY, THE CENTRAL: Founded in 1903. Object: To excite public interest in the question of small holdings; to promote and assist the formation of small holdings societies on co-operative lines, etc. President, The Earl of Stamford. *Secretary:* Mr. Hubert Beaumont, 6, John Street, Adelphi, London, W.C.

SOCIAL-DEMOCRATIC PARTY, THE: Founded as the Democratic Federation in 1881, it changed its name to Social-Democratic Federation in 1884, and in 1907 took the present form. Its objects and earlier history will be found on page 1125, under SOCIAL DEMOCRATIC FEDERATION. The Party has twelve thousand members, with sixty branches in the Metropolitan area, and two hundred in the provinces. During the fiscal year of 1907-1908 fifty-seven new branches were organized. *Secretary:* Mr. H. W. Lee, 21a, Maiden Lane, Charing Cross, London, W.C.

SOCIALISM BY GOODWILL: In *New Worlds for Old* (Constable), Mr. H. G. Wells writes as follows:—"The world is now a better place for a common man than ever it was before, the spectacle wider and richer and deeper, and more charged with hope and promise. . . . Think of the quite unprecedented numbers of well-ordered homes and cared-for, wholesome, questioning children! And it is not only that we have this increasing sea of mediocre well-being in which the realities of the future are engendering, but in the matter of sheer achievement I believe in my own time. It has been the cry of the irresponsive man since criticism began, that his own generation produced nothing; it is a cry that I hate and deny. When the dross has been cleared away and comparison becomes possible, I am convinced it will be admitted that in the aggregate, in philosophy and significant literature, in architecture, painting and scientific research, in engineering and industrial invention, in statecraft, humanity, and valiant deeds, the last thirty years of man's endeavours will bear comparison with any other period of thirty years whatever in his history.

"And this is the result of effort; things get better because men mean them to get better and try to bring betterment about; this progress goes on because man, in spite of evil temper, blundering and vanity, in spite of indolence and base desire, does also respond to Good Will and display Good Will.

"The present advancement of Socialism must lie now along three several lines: First, and most important, is the primary intellectual process, the elaboration, criticism, discussion, enrichment and enlargement of the project of Socialism. This includes all sorts of sociological and economic research, the critical literature of Socialism, and every possible way—the drama, poetry, painting, music—of expressing and refining its spirit, its attitudes and conceptions. It includes, too, all sorts of experiments in living and association. In the widest sense it includes all science, literature and invention.

"Secondly, comes the propaganda; the publication, distribution, repetition, discussion and explanation of this growing body of ideas, until this conception of a real civilized State as being in the making, becomes the common intellectual property of all intelligent people in the world; until the laws and social injustices that now seem, to the ordinary man, as much parts of life as the east wind and influenza, will seem irrational, unnatural and absurd. This educational task is at the present time the main work that the mass of Socialists have before them. . . . It is a work that every one can help forward in some measure, by talk and discussion, by the distribution of literature, by writing and speaking in public, by subscribing to propagandist organizations.

Education

"And Thirdly, there is the actual changing of practical things in the direction of the coming Socialized State, the actual socialization, bit by bit and more and more completely, of the land, of the means of production, of education and child welfare, of insurance and the food supply, the realization, in fact, of that great design which the intellectual process of Socialism is continually making more beautiful, attractive and worthy. Now this third group of activities is necessarily various and divergent, and at every point the conscious and confessed Socialist will find himself co-operating with partial or unintentional Socialists, with statesmen and officials, with opportunist philanthropists, with trade unionists, with religious bodies and religious teachers, with educationists, with scientific and medical specialists, with every sort of public-spirited person. He should never lose an opportunity of explaining to such people how necessarily they are Socialists, but he should never hesitate to work with them because they refuse the label. For in the house of Socialism as in the house of God, there are many mansions."

SOCIALIST PARTY OF GREAT BRITAIN, THE: Founded in 1904. Object: The establishment of a system of society based upon the common ownership and democratic control of the means and instruments for producing and distributing wealth by and in the interest of the whole community. The number of members in October, 1908, was four hundred. Official organ, *The Socialist Standard*, monthly, 1*d*. Head Offices, 22, Great James Street, London, W.C. (See SOCIALISM, etc., pages 1128 to 1151.)

SOCIALIST SUNDAY-SCHOOL UNION: Founded in 1896. Object: To teach children the elementary principles of Socialism joined to the ethics of useful living, with a view to training and fitness for sharing in the work of the adult socialist movement later. The teaching is non-religious, excepting in so far as the philosophy of Socialism can be considered as a religion. There are 104 schools throughout the country, of which about sixty are included in the London district. A large number of Socialist Ten-Commandment cards have been published, and special work among young men and women is being carried on as a development of the work. Official organ, *The Young Socialist*, monthly, 1*d*. *Secretary:* Mr. Alfred Russell, 366, New City Road, Glasgow.

SOCIAL PURITY ALLIANCE: Founded in 1873. Object: To bring before young men the necessity of leading pure lives, and of practically recognizing the principle that the law of purity is equally binding upon all, men and women alike, and thereby counteracting the causes of social vice. The Alliance numbers nearly four thousand members, the Singapore branch having forty members. Official organ, *The Pioneer*, 1*d*. Chairman, Mr. W. T. Malleson. *Secretary:* Mr. E. Hammond, 18, Tothill Street, Westminster, London, S.W.

SOCIAL SERVICE, WESLEYAN METHODIST UNION FOR: Founded in 1905 for the collection and study of social facts, the pursuit of social service, and the discussion of social problems and theories from the Christian standpoint, with the view to educate public opinion and secure improvement in the conditions of life. The membership totals about two thousand. Official organ, *Quarterly Magazine*. President, Rev. J. Scott Lidgett, M.A. *Secretary:* Rev. W. F. Lofthouse, M.A., Handsworth College, Birmingham.

SOCIOLOGICAL SOCIETY, THE: Founded in 1903. Object: To promote investigation, and to advance education in the social sciences in their various aspects and applications, and to afford a common ground on which workers from all fields and schools concerned with social phenomena may meet. The foreign correspondents of the Society include many eminent Continental and American sociologists. Membership, about four hundred. Official organ, *Sociological Review*, quarterly, 2*s*. 6*d*. President, Sir Edward Brabrook, C.B. *Secretary:* J. W. Slaughter, Ph.D., 24, Buckingham Street, Strand, London, W.C.

SOMERSET, LADY HENRY'S COLONY: (See under TEMPERANCE PROBLEMS.)

SOUTH AFRICA: The grant of self-government to the Transvaal marks an important epoch in the history of South African affairs. The new constitution, which was provided for by Letters Patent issued on December 6th, 1906, consists of a Legislative Council of fifteen members who are elected by the Governor, and a Legislative Assembly of sixty-nine members chosen by the registered voters of the Transvaal. The Legislature is elected for a term of five years, but may be prorogued or dismissed by the Governor. The executive is vested in the Ministers, whose number does not exceed six, and who are appointed by the Governor. Municipalities have already been created in all the most important towns.

Consequent upon the termination of the war, eight million pounds was given by the Imperial Government as a grant in aid of expenses to the Transvaal and Orange River Colony, three millions of this being for free grants to burghers of the late republics to assist their restoration to their homes, two millions for grants to persons in respect of war losses, and three millions for loans to be advanced by the Colonial Governments to supplement losses, etc., under the two first-mentioned grants. The amount thus advanced by the Imperial Government to be repaid out of the first loan raised by the new Colonies. As regards the public debt of the Transvaal, by the South African Loan and War Contribution Act, 1903, the Imperial Government guaranteed interest at three per cent. and the sinking fund payments on a loan of £35,000,000, to be repaid within fifty years from April 1st, 1904.

The Asiatic Problem

The restriction of Asiatic immigration has for some time been a burning question in the Transvaal, and the early years of the new Government have been marked by considerable agitation in connection with the question of the registration of Asiatics, following upon the introduction of the Asiatic Law Amendment and Immigration Restriction Acts, the former of which passed its third reading on September 12th, 1906. The Government had decided that all Indians over sixteen living in the colony must register themselves, and be able to produce a registration certificate on demand or render themselves liable to arrest and deportation. The Indians, although not objecting specially to registration, took up a strong attitude on the further condition imposed as to the taking of finger-prints as a means of identification, and an agitation followed in 1907, which led to notable concessions on the part of the Legislature. The general sentiment was thus summarized by a correspondent of the *Times*: "The Asiatics resent the whole spirit of an Act which singles out their people for special treatment, while the educated men among them dislike being placed in a common category with coolie hawkers and others belonging to the lower classes of their compatriots." In the terms of the concession, the chief objections felt by the Asiatics to compulsory registration were entirely met. Further, Indians who had previously been registered, and, not having returned since the war, were by the Immigration Restriction Act prohibited from ever re-entering the country, had this restriction removed. Religious susceptibilities, which might have been offended by some of the questions as to parentage, etc., required by the regulations were to be respected by the registration officials, and in the case of educated Asiatics the finger-prints' system was dispensed with. Moreover, all sentences passed on those who had incurred penalties for refusing to be registered were remitted. These matters were fully dealt with in a blue-book issued in January, 1908, containing correspondence on the subject which had passed between the Transvaal and Imperial Governments. The compromise arrived at was followed by the immediate voluntary registration of practically the whole Asiatic community, which Lord Selborne, in his speech on the opening of the Transvaal Parliament at Pretoria on June 15th, 1908, estimated as numbering 9072 persons.

In a special article contributed to the London *Daily Express* of February 11th, 1907, Mr. W. T. R. Preston (Commissioner of Trade for the Dominion of Canada) argues that there lies greater wealth for the people of South Africa in its undeveloped agricultural possibilities than in all amalgamated mining interests. It is estimated, he says, that not one-twentieth of the arable land of Cape Colony is being cultivated. This is due (1) to the obsolete methods employed, incident, perhaps, largely to the isolated lives of the settlers; (2) to the lack of labour, for the native labour is either not to be had, or, where it is available, is of little value; (3) to the settler being satisfied at being able to harvest sufficient to keep the family larder filled.

Conditions in 1908

Sir Somerset French, who took up the duties of Agent-General of Cape Colony in February, 1908, on his arrival in London summarized the economic conditions obtaining in the colony as follows: "Business, perhaps, will be on a lower plane, but certainly on a wider and surer basis. The general situation is fairly satisfactory. Exports continue to exceed imports, and strenuous efforts are being made both by the Government and the people to develop the natural productions of the colony. Endeavours are being made to open up new markets and to develop those already existing, and the expansion of our local industries may, to a certain extent, affect our imports. The staple industries of wool, mohair, and ostrich feathers are flourishing. All the colonies are exporting mealies, and it is hoped that a substantial market in colonial-grown oats may be established in this country in the near future. In fact, almost every product of South Africa, mineral and agricultural, is being exported in increasing quantities. The farming industry is at present most prosperous, a result of a series of good seasons. In many districts mortgages are being paid off,

and on the whole the agricultural industry may be said to be in a better position than it has been for many years past. It is true that depression continues to exist in the large towns which benefited very largely from the abnormal and temporary prosperity of the war period. No doubt the process of readjustment is taking place, and, perhaps, for the moment deterioration is beyond control, but business is now on a thoroughly sound basis, and the foundation is being laid for future prosperity. So far as my own department—the Post Office—is concerned, the Savings Bank is fairly holding its own, and the postal receipts are satisfactory."

The *Times* of January 24th, 1908, contained an article by its Johannesburg correspondent on mining progress in South Africa, in the course of which he says: "The Transvaal Government have made, and are making, strenuous efforts to fill the places of outgoing Chinese with natives of South Africa, and up to the present they have made good their forecasts. Whether this can be continued is open to doubt. South Africa is passing through a severe depression. With the exception of the one great industry of mining there is little call for labour. Public works and private enterprises alike have cut down their demands, with the result that there is little or no competition for the black labour offering; but let a measure of prosperity return, and in all probability the mines will experience the same dearth as before. The question of crops also largely affects the native labour supply. For several years past only poor harvests have been gathered. Drought and the ravages of locusts leave the tiller of the soil with poor rewards, and the native population have had to supplement the food obtained from their lands and gardens by the aid of money gained by work. This year rains have been abundant over the whole of South Africa, the destruction of locusts by the different Governments has been on a much larger scale and has also been more effective, maize and Kaffir corn crops are good all over the country, and there will, therefore, after the harvest three or four months hence, be less pressure for natives to seek work. Steps, however, are being taken to provide against a shortage of labour, and there is every reason to believe that they will be successful. It has always been recognized on the Witwatersrand that if a small machine drill could be constructed which could be handled and operated by one man in a narrow stope, the labour problem would lose its terror."

Coloured *v.* White Labour

A Special Commissioner of the *Daily Mail*, writing from Johannesburg, under date March 16th, 1908, deals with remedies suggested towards a solution of the labour difficulties on the Rand, as contained in the majority report of the Transvaal Mining Commission, which he describes as one of the most important documents ever printed in that country. The Commission (he says) boldly tackles the problem which is the gravest of all South Africa's problems—the future of the white race in the sub-continent. The curse of South Africa in the past, and its gravest danger in the future, is the policy of relying upon coloured labour. Two and a half centuries ago the Dutch Council at the Cape decided that slave labour was preferable to white labour. It was resolved that the basis of South Africa should be coloured labour. That policy has never changed to this day. When the great exploitation of mineral wealth increased the demand for labour, there was no attempt to supplement the insufficient native supply by white men. Only coloured labour was sought for, and the dense population of Portuguese East Africa was tapped to run the mines of the High Veldt.

The report of the Mining Industry Commission recommends the adoption of the white labour policy. But it does not urge that the natives of British South Africa should be prohibited by law from competing with the white labourer. It does not place a premium upon the white man; With the exception of a recommendation that one white man should be employed upon every machine drill in the mines, all that it asks for is fair and open competition, both for the white worker and the native of British South Africa. To-day the Kaffirs of the British colonies find themselves crowded out of the labour market by the thousands of natives brought in from Mozambique. To-day the white man finds that the Kaffir is forced by law to stick to his work through the pass system—that the Kaffir has a sort of State guarantee that he will stick to his work for the contracted period.

The Commission asks for the restoration of ordinary working competition. It demands that the premium placed upon the employment of coloured men should not be maintained by the State. It declares that the Transvaal ought not to be flooded with indentured labour from other lands while the white population is diminishing and thousands of people are suffering acute privation. It proposes to stop gradually the importation of Portuguese natives and to get rid of the native pass law. The effect of these measures would be that the labour supply of British South Africa would have to be drawn from British South Africa, and that the native would be a free labourer like the white man.

These steps would admittedly produce a scarcity of native labourers, and thus the white man would be in more demand. It is impossible to enter now into the elaborate calculations made by the Commission in order to demonstrate that the mines of the Rand can be worked by white labour as cheaply as they are to-day by Kaffirs and Chinese.

But the broad question of doing something to increase the employment of white men in South Africa is of vital importance to the future of these colonies. Coloured labourers will not fill the vacant houses or restore the prosperity of the shops, or revive the moribund Stock Exchange, which if things do not improve may have to be closed.

STAGE SOCIETY, THE INCORPORATED: Founded in 1899. Object: To promote and encourage dramatic art, and to serve as an experimental State theatre. Membership, over fourteen hundred. President, Dr. C. E. Wheeler. *Secretary:* Mr. A. E. Drinkwater, 9, Arundel Street, Strand, London, W.C.

STANSFELD TRUST, THE: Founded in 1896. Object: To promote the equality of men and women before the law of the land. A Scrutineer is appointed to examine and report upon Parliamentary Bills so that nothing affecting the legal status of women shall pass into law unobserved. In addition to these Public and Private Bills, the Scrutineer reports on all Bills relating to children and education, and adds information concerning the progress of Bills through both Houses. *Hon. Secretary:* Miss E. C. Harvey, 16, Mays Hill Road, Shortlands, Kent.

STATE REGULATION OF VICE, INTERNATIONAL FEDERATION FOR ABOLITION OF: A British Committee was founded in 1875. Object: The abolition of prostitution as a legalized or officially tolerated institution, regarding such control as an official sanction to immorality, a grave hygienic mistake, a great injustice to women and a moral and legal wrong, involving the subversion of individual liberty and of the principles of constitutional government. The British Committee specially endeavours to apply the principles of the Federation in the United Kingdom, in India, and the British Colonies. Official organ, *The Shield*, monthly, 1*d*. Chairman, Mr. Henry J. Wilson, M.P. *Hon. Secretary:* Professor Stuart, LL.D., M.P., 17, Tothill Street, Westminster, London, S.W.

SUICIDE: There is a steady growth in the number of suicides. In the United Kingdom during 1907, 3400 persons took their own lives. One of the most recent efforts inaugurated by the Salvation Army is the Anti-Suicide Bureau, which completed the first eighteen months of its work in July, 1908. The object is to keep "open house" for would-be suicides, and, fantastical as at first the scheme seemed, about fifteen hundred persons have sought the advice of the Bureau instead of committing the final act. The actual figures are available for the twelve months' work to January, 1908, which show that 1125 men and ninety women have been dealt with. These figures apply to the London Bureau only, but there are branches in the provinces, in New York, Chicago, Melbourne, and other great cities. With regard to the men, the causes to which they attributed their distressing condition are as follows: (1) Financial embarrassment or hopeless poverty, 609 = 54 per cent.; (2) Drink, drugs, and disease, 121 = 11 per cent.; (3) Melancholia, proceeding from loneliness and other causes, 105 = 9 per cent.; (4) Crimes such as embezzlement, forgery, and the like, 54 = 5 per cent.; (5) General causes, such as accidents, sickness, and other misfortunes, 236 = 21 per cent. Total: 1125 = 100 per cent.

A recent article by Professor Westermarck, published in January, 1908, in the *Sociological Review*, promulgates the professor's belief that suicide will come to be more and more regarded as a permissible way of taking leave of life.

SUNDAY CLOSING ASSOCIATION, CENTRAL: Founded in 1867. Object: To secure public-house closing on Sundays and also at an earlier hour on week-days. Official organ, *The Sunday Closing Reporter*, quarterly, 1*d*. President, Sir Robert W. Perks, Bart., M.P. *Secretary:* Mr. J. Woodford Causer, 9, Palace Chambers, Bridge Street, Westminster, London, S.W.

SWADESHI MOVEMENT: (See under INDIAN.)

SWARAJ MOVEMENT: (See under INDIAN.)

SWEATING: The conditions under which comparatively unskilled workers labour, more particularly in regard to hours and wages, constitute one of the most complex of present-day problems, forming the main issue of the movement for the prevention of sweating, as it is among this class of worker that the sweating system is most prevalent. An exhaustive epitome of the general history of sweating in various parts of the world will be found on page 1178, and some earlier data with regard to the position in the United Kingdom is included. Questions of hours of work and remuneration are dealt with under the heading of the Woman Worker (unskilled labour section). It is therefore proposed in the present article to deal more particularly with the efforts of social reformers and legislators to grapple with the problem.

Lord Milner made a notable speech on the topic at Oxford on December 6th, 1907, as follows:—

"This matter is one of great national importance, because the sweated workers are numbered by hundreds of thousands, and because their poverty and the resulting evils affect many beside themselves, and exercise a depressing influence on large classes of the community. What do we mean by sweating? I will give you a definition laid down by the Parliamentary Committee of Inquiry: 'Unduly low rates of wages, excessive hours of work, and insanitary condition of the workplaces.'

"My view is, that the sweating system impoverishes and weakens the whole community, because it saps the stamina and diminishes the productive power of thousands of workers, and these in their turn drag others down with them. It means an industry essentially rotten and unsound. Because an industry which does not provide those engaged in it with sufficient to keep them in health, is essentially unsound. Used-up capital must be replaced, and of all forms of capital the most fundamental and indispensable is the human energy necessarily consumed in the work of production. A sweated industry does not provide for the replacing of that kind of capital. It squanders its human material. It consumes more energy in the work it exacts than the remuneration it gives is capable of replacing. The workers in sweated industries are not able to live on their wages. As it is, they live miserably, grow old too soon, and bring up sickly children. But they would not live at all, were it not for the fact that their inadequate wages are supplemented, directly, in many cases, by out-relief, and indirectly by numerous forms of charity; the community has to make good the inefficiency that sweating produces. If a true account could be kept, it would be found that anything which the community gains by the cheapness of articles produced under the sweating system is more than outweighed by the indirect loss involved in the inevitable subsidizing as indicated of a sweated industry. That would be found to be the result, even if no account were taken of the greatest loss of all, the loss arising from the inefficiency of the sweated workers and of their children, for sweating is calculated to perpetuate inefficiency and degeneration.

"The question is: Can anything be done? Of the three related evils, it is evident that the first applies equally to sweated workers in factories and at home, but the two others are to some extent guarded against, in factories, by existing legislation.

Fixing a Limit

"An increase of wages, then, is the primary condition of any real improvement in the lives of the sweated workers. So the point is this. Can we do anything by law to screw up the remuneration of the worst-paid workers to the minimum necessary for tolerable human existence? I know that many people think it impossible, but my answer is that the fixing of a limit below which wages shall not fall is already not the exception but the rule in this country. Take the case of the State, the greatest of all employers. The State does not allow the rates of pay, even of its humblest employés, to be decided by the scramble for employment. The State cannot afford, nor can any great municipality afford, to pay wages on which it is obviously impossible to live. In the case of the staple industries, rates of remuneration are fixed, in innumerable instances, by agreement between the whole body of employers in a particular trade and district on the one hand, and the whole body of employés on the other. But in sweated industries this is not the case. Sweated industries are the unorganized industries, with no possibility of organization among the workers. Here the individual worker, without resources and without backing, is left, in the struggle of unregulated competition, to take whatever he can get. Hence the extraordinary inequality of payment for the same kind of work and the generally low average of payment, which are the distinguishing features of all sweated industries.

"I shall probably have your concurrence therefore when I say that the proposal that the State should intervene to secure, not an all-round minimum wage, but the same wages for the same work, and nothing less than the standard rate of his particular work for every worker, is not a proposition that the State should do something new, or exceptional, or impracticable. It is a proposal that the State should do for the weakest and most helpless trades what the strongly organized trades already do for themselves. I cannot see that there is anything unreasonable, much less revolutionary or subversive, in that suggestion.

"The rates of remuneration arrived at would be based

on the consideration of what the employers could afford to pay and yet retain such a reasonable rate of profit as would lead to their remaining in the industry. Such a regulation of wages would be as great a protection to the best employers against the cut-throat competition of unscrupulous rivals as it would be to the workers against being compelled to sell their labour for less than its value.

"I have only one word more to say. I come back to the supreme interest of the community in the efficiency and welfare of all its members, to say nothing of the removal of the stain upon its honour and conscience which continued tolerance of this evil involves. I feel no doubt that, whether by the adoption of such a measure as we have been considering, or by some other enactment, steps will before long be taken for the removal of this national disgrace."

The Select Committee

For the purpose of considering and reporting on the question of sweating in trades in which there was home work, and to discuss the possibilities of establishing a Board for fixing wages-minima in various trades, a Select Committee of the House of Commons was formed in 1907, and issued a report on July 28th, 1908. Sir Thos. Whittaker was the chairman, and their conclusions may be summarized as follows :—

(1) That there should be legislation with regard to the rates of payment made to home workers who are employed in the production or preparation of articles for sale by other persons.

(2) That such legislation should at first be tentative and experimental, and be limited in its scope to home workers engaged in the tailoring, shirtmaking, underclothing, and babylinen trades, and in the finishing processes of machine-made lace. The Home Secretary should be empowered after inquiry made to establish wages boards for any other trades.

(3) That wages boards should be established in selected trades to fix minimum time and piece rates of payment for home workers in those trades.

(4) That it should be an offence to pay or offer lower rates of payment to home workers in those trades than the minimum rates which had been fixed for that district by the wages board.

(5) That the delivery and collection of work done at home should be done by persons in the direct employ and pay of the employer. Where that was not done, the amount which a worker could earn in a specified time should be calculated on a basis which included the time spent in fetching and returning the work as time occupied in doing the work.

(6) That all home workers who are employed by other persons in producing or preparing articles for sale should be required to register their name, address, and class of work at, and receive a certificate of such registration from, the offices of the local authority, and that the keeping of accurate outworkers' lists by employers should be strictly enforced.

(7) That it should be an offence for any person to employ any home worker to produce or prepare any articles for sale by another person unless the worker produce a certificate of registration.

(8) That the provisions of Section 9 of the Public Health Act, 1875, with regard to factories and workshops which are not kept clean or are ill-ventilated or overcrowded should be extended to rooms in which home work is done, and power should be given to sanitary and factory inspectors to inspect them and secure the enforcement of the law.

(9) That the full protection of the Truck Act should be secured to home workers.

The Committee stated frankly that "sweating" as referring to work paid for at a rate which yields to the worker an income quite insufficient to obtain anything like proper food and living conditions, no doubt prevailed to such a degree as to call urgently for the interference of Parliament. The report continued—

"The problem which is presented by the fact that a very large number of people are unable to, or, at any rate, do not, earn more than a mere pittance, and consequently live under conditions which are conducive to anything but social, material, and moral well-being, is admittedly a many-sided and very difficult one. More or less similar conditions prevail, not only in all the great countries on the Continent of Europe, but also in the United States of America, and even in Australasia. All these countries have either already attempted to deal with the question in some way or other, by legislation, or are considering the best way in which they can do so."

Among the reasons given by the Committee, why the earnings generally are so meagre, were :—Much of it is sewing, which requires no previous training, and as it can be done at home at piece rates the supply of workers is large and elastic. Then there are the competition with machinery, the interference of the middleman, and the fierce rivalry among the employers in most of the sweated trades. Most of the home workers are women, and represent a helpless, unorganized class, which is powerless to resist a reduction in rates.

It was obviously the view of the Committee, after taking all the evidence into consideration, that the case of the oppressed home worker had been fully made out.

Discussing the report in detail, Miss Gertrude M. Tuckwell wrote in the *Commonwealth* for September, 1908—

"The report, as passed, cannot be looked upon as satisfactory, but is infinitely better than the draft report proposed. Not only were the main lines of the proposals extended and made clear, but many of the smaller changes effected by the Committee represent substantial gains over the draft report. All things considered, the report is singularly favourable."

In October, 1906, the then newly formed Anti-Sweating League (*q.v.*), called a National Conference of Labour Representatives. This conference took place in the Guildhall, London, and was formally opened by the Lord Mayor. At the end of deliberations extending over three days, the representatives of two million workers approved the policy of the League, and gave a unanimous vote to a resolution affirming the principle of a minimum wage.

Sweated Industries Bill

The effect was thus to give to the minimum wage proposal the large support necessary to transform it into practical politics, and thereupon a Bill was formulated under the title of the "Sweated Industries Bill." The proposal was introduced in Parliament by Mr. Toulmin, and passed its second reading on February 21st, 1908, when it was referred to the select committee on home work above referred to, who, in view of their report, did not consider its clauses, but reported the Bill without amendment to the House for consideration during the autumn session.

The speeches in the House of Commons on the occasion included one by the Rt. Hon. Herbert Gladstone, the Home Secretary, who referred to conditions in Germany as evidenced by a memorandum from which he quoted, and which was published in Germany on the Exhibition of Home Industries opened in Berlin in 1906. "The average hour's wage in the home industries represented at the exhibition worked out at about ten pfennigs, or about one penny, in the case of work which required no special skill. That would yield a pitiful wage of about six shillings a week. For making a lady's mantle the workers received two shillings, while the middleman earned seven shillings, and the selling price was five pounds. He approved of sending the Bill to the Select Committee. If the Bill was read a second time it would be referred to the Select Committee. In the opinion of the Government a case was made out for an inquiry as to the methods that should be devised to deal effectually with the evil of sweating in unorganized trades. He therefore accepted the proposal. The House would not be surprised to hear that this position was not to be considered as committing the Government itself to the principle of a compulsory minimum wage. The House would naturally accept that decision, because the Government set up this committee of inquiry last year. A Commissioner was sent out specially to Australia to report on the working there, and it was but natural and proper in these circumstances that, until the two reports were submitted to the House, the Government should reserve their judgment. He hoped that great profit would accrue from the report

of the Committee. The lot of these poor people was so hard, so full of wretchedness and misery, that, though evoking the sympathy of all, it might be extremely hard to provide a workable remedy. But that lot might justify experiments in legislation, which, if they failed, would do no harm, provided that they were carefully and prudently designed, but which, if they succeeded, might be profitably extended on a wider basis."

The Sweated Industries Bill, referred to, proposes that—

1. Wages boards shall be established throughout the United Kingdom for the trades specified: tailoring; dressmaking; the making, altering, trimming, finishing, and repairing of shirts, and shall act for such areas as the Secretary of State may determine.

The Secretary of State may, if he thinks fit, on application being made and an inquiry being held as hereinafter provided, direct that a wages board shall be established for any other trade in any district.

A wages board shall have power to make regulations fixing the minimum rate of wages to be paid to persons employed in their district in or about their trade.

2. Application for the establishment of a wages board for any trade in any district may be made to the Secretary of State by any trade union or trades council which represents persons employed in the trade in the district, or by any six persons who are either employers of labour or employed in the trade in the district.

On application being made as provided in this section, the Secretary of State shall cause an inquiry to be held into the desirability of appointing a wages board in accordance with the application, and the provisions of sections forty-five and forty-six of the Coal Mines Regulation Act, 1887, shall apply to the inquiry with the necessary modifications.

3. One half of the number of members of a wages board other than the chairman shall be representatives of employers and one half representatives of persons employed in the trade in the district.

The chairman shall be chosen by the other members, or in default shall be nominated by the Secretary of State.

4. The term of office of a wages board shall be five years, or such shorter time not being less than two years as the Secretary of State may in any case at any time determine.

5. The minimum rate of wages fixed by a wages board may be calculated either by time or by piece-work, or so as to give an employer the option of paying either by time or by piece-work, except that in case of work given out from a factory or workshop or other place to be done elsewhere it shall be calculated by piece-work only.

The minimum rate of wages may be fixed for any kind or kinds of work in a trade, and may be different for different kinds of work, and for different parts of the district, as the board think fit.

The minimum rate of wages may be fixed for any class or classes of persons employed in a trade, and may be different for different classes of persons employed, as the board think fit.

6. Regulations made by a wages board fixing a minimum rate or rates of wages for a trade in their district shall state the date from which the minimum rate or rates of wages shall be established, and the minimum rate or rates of wages shall be established for that trade in that district as from that date, and shall continue established until they are cancelled by the wages board or their successors.

7. A document purporting to be a copy of regulations under this Act, and to be signed by an inspector appointed under the Factory and Workshop Act, 1901, shall be evidence (but not to the exclusion of other proof) of the regulations and of the minimum rate or rates of wages fixed by them, and of the fact of the due establishment of the minimum rate or rates under this Act.

8. Where a minimum rate of wages is established in any district for any class of persons employed in any kind of work in any trade, any person carrying on business in the district who pays or offers wages, or on whose behalf wages are paid or offered, at a lower rate than the minimum, to any person of that class employed by him in that kind of work in that trade, shall be guilty of an offence against this Act.

If wages are paid or offered by time where the minimum rate established is calculated by piece-work, or if wages are paid or offered by piece-work where the minimum rate established is calculated by time, the wages shall be deemed to be paid or offered at a lower rate than the minimum.

Any person guilty of an offence against this Act shall be liable on summary conviction in case of a first conviction to a fine of not less than one pound or more than five pounds for each offence, and in case of a second or subsequent conviction within two years from the last conviction to a fine of not less than two pounds and not more than twenty pounds for each offence.

When a person has been paid wages at a rate less than the minimum rate fixed under this Act, and applying to him, he shall be entitled to recover the deficiency.

9. It shall be the duty of inspectors appointed under the Factory and Workshop Act, 1901, to enforce the provisions of this Act within their districts.

Effects of Boards

The effects of the creation of boards—states the Anti-Sweating League in its last annual report—would be direct and indirect. The direct effects would be shown in increases of wage of uncertain but often probably of considerable extent. The indirect effects of the boards would be equally important. In particular trades, and in particular districts, manufacture is leaving the workshop for the garret and the slum. The boards will have power to arrest so serious a tendency by putting upon the employer of outworkers in the shape of a higher piece rate the equivalent of the hundred burdens he now escapes.

Even if the boards did not differentiate against outwork, the mere enforcement of minimum wages would suffice to prevent its undue increase. The boards would tend also by their determinations to fix a general minimum standard of payment for women. Thus, the term sweating would be given sharper meaning, and fair wages clauses in the contracts of public bodies would begin to apply to women as well as to men.

Probably the most important effects of the creation of boards would spring from the power given to the Home Secretary to establish them in additional trades. In this provision the employer of the worst kind would find a continual restraint, since his failure to deal equitably with his workers might bring down upon him a Governmental inquiry, to be followed possibly by the creation of a board empowered to fix the standard of wages to which he would be compelled to conform.

At the great Co-operative Festival and Congress held at the Crystal Palace, London, in August, 1908, a resolution was adopted in favour of wages boards as a palliative to sweating, its terms being—

"That this conference views with the greatest concern the wide prevalence of sweating methods in the various industries of this country, and calls upon the Parliamentary Committee of the Co-operative Congress to do all in its power to secure the passing of any Bill now before Parliament (or that may be introduced) which has for its object the establishment of wages boards; and to urge the Government to legislate on the subject in the forthcoming autumn session."

According to Mr. Ernest Aves, the Wages Boards of Australia are not likely to be usefully imitated in Great Britain. Thus he, having investigated the subject at first hand, submits a conclusion wholly different from that of others who have lacked opportunities of local study.

An epitomized report appears under WAGES BOARDS.

T

TARIFF REFORM: The year 1908 saw the opening of the second half-decade of the tariff reform agitation, its most important feature being the issue of the report of the Tariff Commission upon the history and the existing position of Colonial preference and Imperial reciprocity. The question of the taxation of foreign manufactured goods had marked no distinctive advance, but its advocates claimed continued and growing evidence that the exigencies of Exchequer requirements would ere long lead to the inevitable resort to an industrial tariff as regards foreign trade relations.

The resolutions passed unanimously by the Colonial Conference of 1902 were reaffirmed at the second Conference held in London in 1907, all the Colonial Prime Ministers taking part, but the British Government dissented. In addition, further resolutions were passed regarding the commercial relations of the United Kingdom and the Colonies, and recommending that his Majesty's

Government should take into consideration the possibility of granting preferential considerations to all portions of the Empire on the dutiable articles in the British Tariff. The Conference discussions and resolutions indicated a willingness on the part of the Colonies to extend the preferences already granted to British trade, if in return some commercial advantage over the foreigner was given them in the markets of the Mother Country.

The Report of the Tariff Commission, referred to above, was issued on July 22nd, 1908. A brief survey of the facts and figures contained in the memorandum was given in a "Summary Statement" included in the report. Its main points were :—

The anticipations of Canadian statesmen in 1846 that the abolition of the English preferences would divert Canadian trade into United States channels were realized under the 1854–1866 reciprocity treaty between Canada and the United States, when the annual average interchange of commodities between the two countries rose from 11¼ to 84 million dollars.

During the period of this treaty and after its termination at the instance of the United States in 1866, Canadian statesmen again and again pressed upon British Governments the desirability of the readoption of preference adapted to modern conditions and arranged on a reciprocal basis as between the United Kingdom and the Colonies and as between colony and colony. Canada having adopted her protective tariff, Sir John Macdonald and his colleagues while in London in 1879 made a definite proposal for "a reciprocity treaty with England," which, however, went no further.

At each of the five Colonial Conferences, beginning with that of 1887, colonial proposals for preferential trade within the Empire had been submitted to British Ministers without result. Canada, Australia, New Zealand, and South Africa have embodied the principle of preference in their tariffs.

Colonial Reciprocity

As regards the reciprocity asked for by the Colonies at the Conferences of 1902 and 1907, it was admitted by British Ministers that great and increasing benefit had accrued to the industries of the United Kingdom from the colonial preferences in force, but they refused to accede to the preferential resolutions of the Conference in so far as these implied that it was "necessary or expedient to alter the fiscal system of the United Kingdom."

Colonial Ministers had indicated the general lines upon which they would be prepared to move towards inter-Imperial reciprocity. Their tariffs must be so designed as to bring in the revenue needed for administration, and they must have regard for colonial interests, as British Ministers must have regard for the economic interests of the United Kingdom. But beyond these primary objects colonial Governments were prepared in their tariff policy to go the fullest lengths to encourage importation from the United Kingdom rather than from foreign countries. The character of the trade of the Colonies and the structure of their tariffs provided a large margin for the extension of preference.

Meanwhile negotiations had taken place between Canada and foreign countries, and a treaty of commerce between Canada and France was concluded in the autumn of 1907, but awaited ratification, and was, therefore, not in force. That treaty, by bringing into operation certain rates of duty of the Canadian intermediate tariff and by special concessions, reduced the British preference on competitive goods.

Discussing that part of the report which refers to the capacity of food production within the Empire, the *Times* of July 23rd remarked :—

"There is a useful table showing the increasing dependence of this country upon other parts of the Empire for its staple food supplies. That change of base is forced upon us by market conditions and by the increasing consumption at home of countries upon which we used mainly to rely. But there is plenty of room for stimulation of food production within the Empire, coupled with equal stimulation of industry at home. In another section the Commission gives the operation of such preferences as the Colonies have voluntarily offered to us, and shows that in the decade before preference began we were losing trade, while after preference had begun to operate the loss was replaced by a great expansion of our exports. But, as is graphically shown, we have a great deal of leeway to make up, since foreign countries, thanks to our short-sighted policy, do much more business than ourselves with Colonies that would far rather trade with us if they could. They cannot, however, wait indefinitely upon this country. They are now great States fully conscious of their importance, and they cannot afford to reject the advantageous offers which other nations more farseeing than ourselves press upon them."

The new Canadian tariff introduced in November, 1906, indicated the Colonial views on the reciprocity question. In this Canada adopted—

(1) A general tariff, to operate against all foreign countries with whom she has no arrangement for reducing such tariff;

(2) A preferential tariff, the rates of duty in which are, roughly speaking, one-third less than those of the general tariff, to operate within the Empire ; and

(3) Between the general and preferential tariffs, an intermediate tariff, the rates of duty in which are less than those of the general tariff by roughly one-tenth, to be used for the purposes of negotiation with foreign countries. Australia, also, in 1907, introduced a new and strongly Protectionist tariff, which gave the United Kingdom a 5 per cent. preference over foreign competition in regard to a number of articles. South Africa and New Zealand give a preference of 25 and 10 per cent. respectively.

Indication of the growing tendency towards protective legislation is also claimed by supporters of this line of action, in the Patents Act passed in 1907. In introducing the Bill in the House of Commons, on March 19th, the Rt. Hon. Lloyd-George said : "I am not afraid of foreign competition so long as British trade is free to fight it, free from impossible conditions abroad, from equally stupid tariff systems at home. Many British industries have been completely wiped out by privileges conceded by our own institutions to foreigners."

Germany

On the other hand opponents of a protective policy point to the economic conditions prevailing in countries where such a system obtains, as a strong argument against its adoption. Figures are instanced in this connection on the increased cost of living in Germany, as shown in statistics compiled by the Prussian Civil Service Club at Breslau, consequent upon a proposal to raise the salaries of German civil servants. The tables set forth the increase per cent. in the general cost of living between the years 1896 and 1908 as follows :—

MEN'S CLOTHING, ETC.

	Per cent.
A. Hats	10 to 15
B. Underwear—	
Linen	33⅓
Cotton	20 to 25
Woollen	16⅔
C. Clothes—	
Suits	20
Overcoats	25
Woollen goods generally	60·3
Wages paid for making above clothes	50 to 66⅔
D. Boots	10 to 15
E. Other articles—	
Neckties	10 to 20
Kid gloves	28
Umbrellas	25
Hair-cutting charges	50
Shaving charges	50

Women's Clothing, etc.

	Per cent.
A. Hats	30
B. Underwear—	
Linen	33⅓
Cotton	20 to 25
Woollen	28
C. Clothes—	
Woollen goods generally	60·3
Wages paid for making clothes	50
Finished dresses	50
D. Boots	10 to 16
E. Other articles—	
Umbrellas	25
Kid gloves	28

Children's Clothing, etc.

A. Hats	10 to 25
B. Underwear—	
Linen	33⅓
Cotton	20 to 25
Woollen	28
C. Clothes—	
Dresses	20 to 50
Overcoats	30 to 35
Woollen goods generally	60·3
Wages paid for making clothes	50 to 66⅔
D. Boots	10 to 15
E. Other articles—	
Neckties	10 to 20
Umbrellas	25
Gloves	28
Hair-cutting charges	50
School fees	20 to 20·4
Books	5 to 10

Provisions.

Butter	13 to 36
Eggs	28
Potatoes	22
Flour	10
Fruit	14
Beans	43
Peas	27
Lentils	85
Rice	16
Groats	11
Semolina	4
Millet	45
Biscuits	17
Lager beer, in bottles	10
Herrings	20
Pepper	53
Onions	20
Meat (average increase)	19

Fuel.

Coals—	
Summer prices	15·3
Winter	22·2
Briquettes—	
Summer prices	12·3
Winter	17·7
Wood	21·4

Household Goods.

Iron kitchen utensils	15 to 20
Wooden kitchen utensils	
Bedsteads	
Mattresses	
Cupboards	
Tables	
Chairs	
Small articles	

Servants.

	Per cent.
Servants	25
Charwomen	33⅓

Washing.

Payment to washerwomen	33⅓ to 60
Soap	60

Washerwomen are employed in almost all families in Germany, the washing not usually being done at laundries. The average increase in the washing bill is put at 40 to 60 per cent. A considerable increase is also noted in doctors' fees, medicines, taxes, burial expenses and church fees.

German Records

In opposition to this, however, is set the report of Mr. Consul-General Schwabach, of Berlin, on the trade of Germany for the year 1906, in which he says: "The improvement of German trade and industry which, after the sudden but comparatively short depression at the beginning of the century, began at first but slowly, and then advanced with ever-increasing force, attained during the year under review what may be termed the high-water mark in the economic development of the German nation. The quantities of goods placed on the market at home and abroad by German factories have, almost without exception, assumed record figures. . . . Work-people of all classes were in strong demand and received employment without regard to nationality. As the dearth of workmen became accentuated in the course of the year working hours were lengthened, night shifts put on and overtime became the rule almost everywhere. The enormous deposits in the savings banks, which in Germany have steadily developed into collecting centres of national wealth, constitute an accurate gauge of the prevailing national prosperity."

Dr. Macnamara, M.P., in a letter to a constituent, dated September 4th, 1908, on the subject of the proposition to impose a small duty on foodstuffs, points out that these small taxes "have a remarkable knack of growing bigger and bigger as time proceeds," and he appends the tables given below as instancing this—

I.—Austria-Hungary.

			Per cwt. s.	d.
Duty on Flour	1882		1	6¼
Ditto	1887		3	9¾
Ditto	1906		6	4¾
Meat: Fresh and Prepared (Treaty with Italy)	1878		3	0½
	1887		6	1
Fresh	1906		12	8½
Prepared	1906		19	0¼
Tinned	1882		40	7
Ditto (Treaty with Germany)	1891		35	6
Ditto	1906		50	10

II.—France.

			Per cwt. s.	d.
Duty on Flour	1862		0	5¾
Ditto	1885		2	5¼
Ditto	1887		3	3
Ditto at the rate of extraction of 70 per cent. and over	1894		4	5¾
Ditto from 70 to 60 per cent.	1894		5	5¼
Ditto 60 per cent. and under	1894		6	6
Fresh Meat	1863		free	
Ditto	1881		1	2¾
Ditto Mutton	1903		14	3
Ditto Pork	1903		10	2
Ditto Beef and other kinds	1903		14	3

		Per head. s.	d.
Oxen	1863 ..	2	10½
Ditto	1881 ..	12	0
Ditto	1885 ..	20	0
Ditto	1887 ..	30	5

[Since 1892 the duty has been laid per cwt. live weight.]

III.—GERMANY.

		Per cwt. s.	d.
Duty on Flour	1879 ..	1	0¼
Ditto	1881 ..	1	6¼
Ditto	1885 ..	3	9¾
Ditto	1888 ..	5	4
Ditto	1892 ..	3	8½
Ditto	1906 ..	5	1¼
Duty on Bacon	1879 ..	6	1
Ditto	1885 ..	10	1½
Ditto	1906 ..	18	0
Duty on Meats (excluding pork, bacon, and tinned meats) ..	1879 ..	6	1
Ditto	1885 ..	10	1½
Meats: Fresh even. chilled ..	1906 ..	13	6
Frozen	1906 ..	17	6
Simply prepared	1906 ..	17	6
Prepared for the table ..	1906 ..	37	6

Against this, again, is placed the comparatively larger increase in wages as shown in the report of the Essen Chamber of Commerce on wages in Germany (Krupp's Factory), which gives the following tables:—

AVERAGE DAILY WAGES.

BEFORE PROTECTION.	s.	d.	AFTER PROTECTION.	s.	d.
1871	3	0½	1882	3	7
1875	3	10¾	1886	3	8½
1879	3	0¼	1894	4	0¾
			1895	4	1¼
			1900	4	9¼

The report, after giving particulars regarding food prices, concludes that "wages under Protection rose considerably more than the price of food." (See page 1190; also PROTECTION, FREE TRADE.)

TAXATION OF LAND VALUES: (See under LAND VALUES.)

TAXATION OF LAND VALUES, ENGLISH LEAGUE FOR THE: Founded in 1883. The League has seven district and local branches in England. Official organ, *Land Values*, monthly, 1*d*. President, Mr. Josiah C. Wedgwood, M.P. *General Secretary:* Mr. Frederick Verinder, 376, Strand, London, W.C.

TAXATION OF LAND VALUES, SCOTTISH LEAGUE FOR THE: Founded in 1890 with the object of achieving the removal of all taxation on industry and the earnings of industry, and the substitution of a single tax on the value of land, whether used, partially used, or held idle. Number of subscribers, fourteen hundred. Official organ, *Land Values*, monthly, 1*d*. President, ex-Bailie Fairlie, J.P. *Secretary:* Mr. James Busby, 13, Dundas Street, Glasgow.

TEACHING PROFESSION, THE: (See under WOMAN WORKER, THE.)

TEMPERANCE ASSOCIATION, BRITISH MEDICAL: Founded in 1876. Membership, about six hundred. Official organ, *The Medical Temperance Review*, quarterly, 6*d*. President, Prof. G. Sims Woodhead, M.A., M.D., F.R.S., Ed. *Hon. Secretary:* W. McAdam Eccles, M.S., M.B., F.R.C.S., 124, Harley Street, London, W.

TEMPERANCE ASSOCIATION, NATIONAL BRITISH WOMEN'S: Founded in 1876. Membership, 126,703. Official organ, *The White Ribbon*, monthly, 1*d*. President, The Countess of Carlisle. *Secretary:* Miss Gertrude Hunt, 47, Victoria Street, Westminster, London, S.W.

TEMPERANCE ASSOCIATION, ROYAL ARMY: Founded in 1893. Object: Promotion of temperance in the Army at home and abroad. Members, 23,900 at home and in the colonies; 28,880 in India. Official organ, *On the March*, monthly, 1*d*. President, H.R.H. the Duke of Connaught. Chairman, Earl Roberts, V.C. *Secretary:* Mr. Clare White, 47, Victoria Street, London, S.W.

TEMPERANCE BUREAU, INTERNATIONAL: Founded at the International Anti-Alcoholic Congress at Stockholm in 1907. Object: To serve as a connecting link between temperance societies the world over, and to collect and disseminate information on the various phases of the temperance reform. There are forty-one affiliated societies. President, R. Hercod, Litt.D. *Secretary:* Dr. Preisig, 24, Ave. Ed. Dapples, Lausanne, Switzerland.

TEMPERANCE COUNCIL, NATIONAL UNITED: Founded in 1896. The special work includes the retention of expert officers, learned in licensing laws; and opposition to the grant of new licences and other facilities, and the extinction of existing licences. Official organ, *United Temperance Gazette*, monthly, 1*d*. President, Mr. Arnold F. Hills, M.A., D.L. *Secretary:* Mr. Charles Pinhorn, 28, Memorial Hall, Farringdon Street, London, E.C.

TEMPERANCE FEDERATION, NATIONAL: Founded in 1884. President, Mr. A. Cameron Corbett, M.P. *Hon. Secretary:* Mr. Joseph Malins, J.P., C.C., 168, Edmund Street, Birmingham.

The Federation includes the following organizations:—

Anglo-Indian Temperance Association.—*Secretary:* Frederick Grubb, 36, Iveley Road, Clapham, S.W.

Baptist Total Abstinence Association.—*Secretary:* Rev. E. S. Hull, 119, Camberwell Grove, London, S.E.

Bible Christian Methodist Temperance Association.—*Secretary:* Rev. A. Hancock, 8, Mount Gold Road, Plymouth.

British Anti-Narcotic League.—*Secretary:* J. B. Davis, 25, Market Street, Manchester.

British Temperance League.—*Secretary:* Charles Smith, 29, Union Street, Sheffield.

Central Sunday Closing Association.—*Secretary:* J. Woodford Causer, 9, Palace Chambers, Bridge Street, Westminster, S.W.

Congregational Temperance Committee.—*Secretary:* Rev. W. Mottram, 279, Friern Road, East Dulwich, S.E.

Friends' Temperance Union.—*Secretary:* J. W. Harvey Theobald, 15, Devonshire House, Bishopsgate, London, E.C.

Grand Lodge of England, I.O.G. Templars.—*Secretary:* Edward Oliver, 168, Edmund Street, Birmingham.

Grand Lodge of Ireland, I.O.G. Templars.—*Secretary:* J. Haveron, City Chambers, Royal Avenue, Belfast.

Grand Lodge of Scotland, I.O.G. Templars.—*Secretary:* T. Honeyman, 204, St. Vincent Street, Glasgow.

Grand Lodge of Wales (English) I.O.G. Templars.—*Secretary:* A. H. N. Reddaway, 86, Richards Terrace, Cardiff.

Grand Lodge of Wales (Welsh) I.O.G. Templars.—*Secretary:* O. N. Jones, Gwyddonfa, Pwllheli.

Independent Order of Rechabites.—*Secretary:* Richardson Campbell, 26, Bury New Road, Manchester.

Irish Association for the Prevention of Intemperance.—*Secretary:* W. R. Wigham, 4 and 5, Eustace Street, Dublin.

Irish Temperance League.—*Secretary:* W. Wilkinson, 20, Lombard Street, Belfast.

Midland Temperance League.—*Secretary:* R. Mildren, Y.M.C.A. Buildings, Dale End, Birmingham.

National British Women's Temperance Association.—*Secretary:* Miss Gertrude Hunt, 47, Victoria Street, Westminster, S.W.

National Division Sons of Temperance.—*Secretary:* Walter Davies, Abbey Cottage, North Road, Clayton, Manchester.

National Unitarian Temperance Association.—*Secretary:* W. R. Marshall, 31, Birkhall Road, Catford, S.W.

National United Temperance Council.—*Secretary:* Charles Pinhorn, 28, Memorial Hall, Farringdon Street, London, E.C.

New Church Temperance Society.—*Secretary:* Thomas J. Barlow, 59, Ridley Road, Forest Gate, E.

North of England Temperance League.—*Secretary:* H. Patterson, Temperance Institute, Rutherford Street, Newcastle-on-Tyne.

North Wales Temperance Association.—*Secretary:* Rev. H. R. Davies, Hirrall, Bangor.

Primitive Methodist Temperance Society.—*Secretary:* Rev. T. H. Hunt, 14, Wentworth Place, Bolton.

Scottish Permissive Bill and Temperance Association.—*Secretary:* W. J. Allison, 108, Douglas Street, Glasgow.

Scottish Temperance League.—*Secretary:* James Gillies, 108, Hope Street, Glasgow.

Southern Counties (and Dorset) Temperance Association.—*Secretary:* Edwin T. Jenkins, 33, Victoria Road, Poole.

South Wales and Monmouthshire Temperance Association.—*Secretary:* Rev. Morris Morgan, 73, King Edward's Road, Swansea.

United Methodist Temperance League.—*Secretary:* Rev. John Thornley, 21, Filey Street, Sheffield.

Wesleyan Reform Temperance League.—*Secretary:* Rev. W. S. Goodwin, 74, Ryan Street, West Bowling, Bradford.

Western Temperance League.—*Secretary:* A. J. Barker, "Tintagel," Windsor Road, St. Andrew's Road, Bristol.

Women's Total Abstinence Union.—*Secretary:* Miss S. L. Boyd, 4, Ludgate Hill, London, E.C.

Workhouse Drink Reform League.—*Secretary:* W. C. Amery, 9, Temple Street, Birmingham.

TEMPERANCE LEAGUE, BRITISH: Founded in 1835. There are over one thousand members, with 245 county district and town societies affiliated. Official organ, *British Temperance Advocate*, monthly, 1*d*. President, Mr. Henry J. Wilson, M.P. *Secretary:* Mr. Charles Smith, F.S.S., 29, Union Street, Sheffield.

TEMPERANCE LEAGUE, IRISH: Founded in 1858. (Incorporated, 1900.) Temperance cafés and restaurants are operated, both for monied people and the working classes; also Farmers' Rests for the accommodation of farmers, their horses and vehicles. Official organ, *Everybody's Monthly*, 1*d*. President, Sir Algernon Coote, Bart., H.M.L. *Secretary:* Mr. W. Wilkinson, 16, Lombard Street, Belfast.

TEMPERANCE LEAGUE, NATIONAL: Founded in 1856. Official organ, *The National Temperance Quarterly*. The League does important special work among medical men, educationalists, labour organizations, etc., towards a better application of the principles of scientific temperance and other phases of the reform. There is a Research Scholarship effective. President, The Dean of Hereford. *Secretary:* Mr. John Turner Rae, 34, Paternoster Row, London, E.C.

TEMPERANCE LEAGUE, NORTH OF ENGLAND: Founded in 1858. Federated to the League are over one thousand societies, with an estimated membership above 100,000. Connected with the League is the Temperance Institute at Newcastle-on-Tyne, established as a meeting-place for trade and friendly societies, and other organizations of working men. The Institute held thirty-seven meetings during the first year, while for the year ending July 31st, 1908, the number had reached 1006, with an estimated attendance of fully 100,000 persons. Official organ, *The Temperance Witness*, quarterly, 1*d*. *Institute Secretary:* Mr. Walter Hayler, Temperance Institute, Newcastle-on-Tyne.

TEMPERANCE LEAGUE, SCOTTISH: Founded in 1844. The membership is eleven thousand, with 350 affiliated local temperance societies. Official organ, *The Temperance Leader*, weekly, 1*d*. President, Mr. Alex. P. Forrester Paton, J.P. *Secretary:* Mr. James Gillies, 108, Hope Street, Glasgow.

TEMPERANCE LEGISLATION BOARD, THE SCOTTISH: Founded in 1901. Object: To unite all sections of the country in an endeavour to obtain further legislation on the lines of Lord Peel's Report, and to secure the effective administration of the licensing laws. Hon. President, Lord Peel. *Hon. Secretary:* Mr. G. F. Barbour, 10, Albyn Place, Edinburgh.

GLASGOW: *Hon. Secretary:* Mr. R. L. Bremner, 208, West George Street.

TEMPERANCE LEGISLATION LEAGUE, THE: Founded in 1905. Among the special work done during 1908 was an extensive poster campaign in support of the Government Licensing Bill. President, Lord Peel. *Secretary:* Mr. A. F. Harvey, Parliament Mansions, Victoria Street, London, S.W.

TEMPERANCE PROBLEMS: By Lady Henry Somerset's work at Duxhurst, Surrey, there is being conducted a campaign, started fourteen years ago, for reclaiming inebriate women. The women on the colony come voluntarily for one year, and during the whole period are under no restraint, it being a matter of honour that they stay their period. Every patient enters the hospital first, sometimes for weeks, and her case is carefully diagnosed. Very often drinking habits are due to excessive fatigue, nervous debility, strain, or derangements, to bad digestion, diseased organs. The physical cause is traced wherever possible.

The colony is made up of several cottage homes. In one there are two large work-rooms, one filled with hand-looms of the Swedish pattern where beautiful linen, canvas, and towels are woven. Curtains, table-cloths and other stuffs are woven with tasteful designs and decorations. Outdoor work, fresh air, fresh employment, are all summoned to the aid of the inmates. Indeed, a large part of the success of the colony is due to the variety of occupation offered. The work includes a dairy, a large farm of 180 acres, poultry runs, bee-keeping, two long hothouses, in which melons, tomatoes, cucumbers, and so forth are raised.

Lady Henry Somerset, who personally superintends the work, believes that the cottage system is less expensive in the long run than the barrack system of massing together numbers of individuals whose habits it is sought to change, to whom self-respect must be restored, and a new basis created for character and conduct. To have patients in the mass, and not break them into small, manageable groups, she deems a fatal error. The institution spirit, in her opinion, is usually

fatal to success, the problem being largely psychological. A woman is not passed as cured until she has been two years away from Duxhurst in her own home. But even counting by this rather high standard, there are fifty-eight, sometimes sixty, per cent. of cures.

Another institution for the treatment of inebriety is the Norwood Sanatorium for Inebriates, where a scientific method, including dosage with red cinchona bark, gentian, strychnine, and atropine is in vogue. Of a typical list of 149 cases, sixty-four relapsed, seven were more temperate than formerly, and seventy-eight remained total abstainers. A sex division of the 149 cases showed: of the 111 males, 46, or 41·4 per cent., relapsed: 7, or 6·3 per cent., were improved; 58, or 52·2 per cent., remained abstainers. Of the 38 females, 18, or 47·4 per cent., relapsed; 20, or 52·6 per cent., remained abstainers.

Drug Treatment

One of the most recent movements is the True Temperance Association, formed in mid-August, 1908, and working on entirely different lines from those usually employed by total abstinence and temperance workers. They claim that to be really effective temperance reform must be inclusive, not exclusive, that it should enrol every temperate man and woman, and not merely the total abstainer. The highway to temperance, in their opinion, lies in the reform of the public-house.

The Rev. Dr. Paton, of Nottingham, is a strong believer in the creation of counter-attractions to the public-house. In the course of a lengthy interview he argued—

Counter Attractions

"There is one immense, dominant factor in this problem which has to be specially considered. Our vast industrial population everywhere are tired with the day's work, and they need some refreshment, some recreation for jaded bodies and minds, after the heavy work of the day. All of them also have social instincts and tastes, and desire in the leisure evening to have social intercourse and fellowship, to discuss the politics of the day, to have a game and chat with their neighbours or friends. Here, then, is a great, vital, human need on the part of a great mass of our working people both in town and country. It is a true, natural, instinctive need which somehow or other must be and will be met and satisfied. Now the publican caters for, provides for, this need; and so long as he does so alone, we may preach Temperance as long as we please, still the publican will laugh at our effort. This question is one specially concerning the leisure evening life of the people. Places must be opened quite near at hand in every district. The public-house is near at hand, and so must be the place that is to be its substitute. To offer effective counter-attractions, there must be many of them, and therefore they must not be costly.

"School Board buildings, when they are not used for evening classes, could well be utilized. There are in every town numbers of such buildings which are lying idle and dark at night. They have been erected by the people's money at very great cost, and ought to be used for the people's good, especially for objects like those of the Social Institutes that exist in various places to provide for the social and recreative needs of the people. Many of these school buildings have large halls which are without seats, which are well decorated and heated and beautifully lighted. Such halls could be immediately converted, by a little bright drapery and one or two bits of bright carpet, into splendid drawing-rooms for the people.

"On the question of counter-attraction, the fact that in the City of London tea-shops have become immensely popular has re-acted against the public-houses. During the year ending mid-August, 1908, taking only the shops of four middle-class tea-shop companies in the City of London, 65,000,000 customers were served, and in working-class refreshment rooms of other big concerns over 50,000,000. The adverse effect of this 115,000,000 users of tea-shops on the business of the City public-houses is undoubted. Indeed, as a licence-holder said: "Even allowing for the ladies who are served, and who did not use licensed premises, it is safe to assume that three-fourths of the people catered for would, in the ordinary course, have taken refreshment in the licensed houses if there had not been the counter-attraction."

See also THE CENTRAL PUBLIC HOUSE TRUST ASSOCIATION, etc.

TEMPERANCE SOCIETY, CHURCH OF ENGLAND: Founded in 1862. (Incorporated.) Object: Union and co-operation, on perfectly equal terms, between those who use and those who abstain from intoxicating drinks, by (1) The promotion of habits of temperance, (2) The reformation of the intemperate, (3) The removal of the causes which lead to intemperance. Membership, 624,929. Special work is done in the following departments: Police Court and Prison Gate Mission, Homes for Inebriate Men, Homes for Inebriate Women, Shelter Homes, Racecourse and Van Mission, and the Semi-Teetotal Pledge. Official organs, *The Temperance Chronicle*, weekly, 1*d.*; *The Illustrated Temperance Monthly and Hand and Heart*, weekly, 1*d.*; *The Young Crusader*, monthly, ½*d.* Presidents, The Archbishops of Canterbury and York. *Secretary:* Mr. Gerald A. Thompson, 4, The Sanctuary, Westminster, London, S.W.

TEMPERANCE SOCIETY, ROYAL NAVAL: Founded in H.M.S. *Reindeer*, 1863, to inculcate total abstinence principles in the Royal Navy. Number of members, etc., 27,000. Official organ, *At Home and Abroad*, monthly, 1*d.* President, Admiral G. F. King-Hall, C.V.O. *Hon. Superintendent:* Miss Agnes E. Weston, LL.D., Royal Sailors' Rest, Portsmouth.

TEMPERANCE UNION, WORLD'S WOMAN'S CHRISTIAN: Founded in 1891. The members total nearly half a million. The work embraces effort amongst women in every part of the world. Official organ, *World's W. C. T. U. Bulletin*, monthly, 1*d.* President, The Countess of Carlisle. *Hon. Secretaries:* Miss Agnes E. Slack, Greenhill House, Ripley, Derby, England; Miss Gordon, Rest Cottage, Evanston, Illinois, U.S.A.

TENANTS' HOUSING COUNCIL, CO-PARTNERSHIP: (Established under the auspices of the Labour Co-partnership Association.) Object: To aid in the solution of the housing problem by encouraging and promoting the establishment of Tenants' Co-partnership Societies; to give legal and other advice, and to centralize information as to plans, materials, cost of house construction, etc. Societies are now developing estates at Hampstead, Letchworth, Ealing, Harborne, Sevenoaks, Manchester, Oldham, Wolverhampton, and Leicester. The property of the various societies at the end of 1908 was about £350,000. In June, 1907, a federation of tenants' societies was formed under the title of Co-partnership Tenants, Ltd., with Mr. Henry Vivian, M.P., as chairman, and now (1908) includes eight of the largest and most active of these societies. *Hon. Secretary:* Miss Sybella Gurney, 6, Bloomsbury Square, London, W.C.

THAMES STEAMBOATS: (See under LONDON.)

THRIFT: In the contemplation of the enormous total of the annual national expenditure on strong drink and the vast sums which change hands in betting transactions, the fact is apt to be overlooked that thriftiness is one of the character-traits of the working classes of the United

Kingdom. It is an attribute that strongly commends itself to King Edward VII., who at the opening of the new building of the Hearts of Oak Friendly Society in London, May 28th, 1906, declared that :—

"The encouragement of habits of thrift and foresight and a spirit of independence and self-help—qualities which conduce in the highest degree to the welfare of a nation—is an object which must always have my deepest sympathy."

Sir Oliver Lodge has gone analytically into the question of thrift, its causes and powers, in his pamphlet on Wealth and Expenditure, published by the Fabian Society: "The objects of thrift, or personal saving, are twofold: (1) To provide for sickness, for old age, and for those who are dependent upon us, and whom we should otherwise leave helpless when we go. This is clearly the chief and especially forcible motive for saving: it is the mainspring and original motive-power. But there is also another not at all unworthy motive, though it is one less generally recognized or admitted, and to this I wish incidentally to direct attention.

"The second great motive for thrift and wise accumulation is to increase our own power and influence and effective *momentum* in the world. The man of wealth is recognized as a force in the world, sometimes indeed a force for evil, sometimes for good, but undeniably and always a power. People often complain of this and abuse the instinct which recognizes wealth as being a power. But it is inevitable. It does not indeed follow that great wealth need be concentrated in a few hands, or that one single individual shall have the disposal of it; but, whether in many hands or in few, wealth is bound to be a power; it is no use abusing what is inevitable, we must study and learn how to utilize the forces of nature. Wealth is one of those forces. Why is it so powerful? Because it enables its owner to carry out his plans, to execute his purposes, to achieve his ends. He has not to go cap in hand to somebody and ask permission; he can do the thing himself."

Coming from abstract reasoning to the practical argument of actual experience, an instructive lecture on Thrift, delivered in November, 1907, by Mr. J. D. Stuart Sim, Chief Registrar of Friendly Societies for Great Britain and Ireland, was printed in 1908, and then revised to contain the latest statistics. It is of much value as giving in detail concrete examples of the thriftiness of the British workmen, and it is therefore given somewhat fully—

"Broadly speaking, the whole of the functions of my office are exercised with the view of encouraging, so far as it is at present possible for the State to encourage, the desirable habit of thrift among the working classes of this country, in their respective degrees.

"It is common experience that a person who is thrifty in one direction is not likely to stop there, but, so far as his means permit, to avail himself of those other opportunities by which the self-denial of his earlier years brings increased comfort to his family, and a position of modest independence in his old age.

"A popular form of thrift-investment is the Friendly Society. The number of registered Friendly Societies, and branches of what are known as the Affiliated Orders—the Oddfellows, Foresters, etc., at the close of 1905 amounted to twenty-seven thousand different bodies, with an aggregate membership of nearly six millions, and accumulated funds amounting to forty-two millions sterling. Six years previously, while the number of societies and branches was practically the same, their membership was 5¼ millions, with funds amounting to nearly thirty-three millions of pounds sterling. During the period mentioned the membership of societies has increased by thirteen per cent., while their funds have increased by twenty-eight per cent., a gratifying testimony to the efforts of the members to improve the financial position, and consequently the stability of their societies.

Friendly Societies

"In addition to the above, Collecting Societies take an important position as regards membership; the forty-five Registered Societies having an aggregate membership of 7¾ millions—or a number far exceeding that of the whole of the first-mentioned classes. Their funds, however, average only about £1 per member, against £7 per member in the ordinary Friendly Societies and Branches. Collecting Societies, as a rule, provide for the payment of sums at death only; while the management expenses, consequent upon the system of collecting the members' contributions at their own houses, are necessarily high, being over forty per cent. of the income, against ten per cent. in the other classes referred to.

"Besides the above, several other classes of societies are admitted to registration under the Friendly Societies Act, *e.g.* Benevolent Societies, Medical Societies, Specially Authorized Societies (societies for any purpose which the Treasury Lords may authorize), Cattle Insurance Societies, Societies for the relief of members in case of Shipwreck, or loss or damage to Fishing Boats and Nets, Working Men's Clubs, and Shop Clubs. Altogether these societies number nearly twenty-nine thousand, their members 14¼ millions, and their funds over fifty-two millions sterling.

"The average contribution paid by members of Friendly Societies and branches combined amounted to £1 1*s.* 9*d.* per annum. Of each £1 received, 14*s.* 2*d.* is expended in benefits, 2*s.* 1*d.* in management, and 3*s.* 9*d.* set aside to meet the contingencies of the future. The member of the branch of an Order contributes £1 6*s.* 2*d.* per annum, and of each £1 of total income receives 13*s.* 10*d.* in benefits, while 2*s.* 3*d.* is expended in management, and 3*s.* 11*d.* saved.

"In ordinary societies composed of men, excluding Burial and Dividing Societies, the average contribution is £1 5*s.* per annum, while in similar societies composed of women the average contribution is only 13*s.* 1*d.* per annum. In the former societies, of each £1 of income, 15*s.* 2*d.* is expended in benefits, 1*s.* 7*d.* in management, while 3*s.* 3*d.* is added to the accumulative funds. In the latter societies the proportions are 14*s.* 10*d.*, 2*s.*, and 3*s.* 2*d.* respectively. Having regard to the comparative smallness of the average contribution in female societies, while the liability of the members to come upon the funds is greater than in male societies, the rate of benefits payable is necessarily lower than in societies composed of men.

"As a training school in thrift, Juvenile Societies occupy an important position, and much greater attention has, during recent years, been given to the encouragement of juvenile membership, the Act of 1896 permitting the admission of members of one year of age.

"The contributions of members of registered Friendly Societies and branches amount to upwards of six millions sterling per annum, while the interest on their invested funds amounts to nearly two millions. Four millions annually are applied to relief in sickness, £860,000 in sums at death, £430,000 in old age pay and other benefits of an individual nature. £370,000 is expended in various other payments to the advantage of the members; £850,000 in management expenses, an average of 2*s.* 10*d.* per member, while the remaining balance of 1¼ millions sterling is set aside to meet future claims.

"The most popular form of security among Friendly Societies is still that of land, buildings, and mortgages; nearly sixty per cent. of their funds being so invested. The various forms of investment and the amount invested may be stated thus:—

"In land, buildings, and mortgages upwards of twenty-five millions; in Government securities, including Savings Banks, nearly 6¾ millions; in local securities 5¾ millions; in railway stock 1¼ millions; the remaining balance being made up of cash in hand of nearly one million, and of other investments.

"The amount invested in land, buildings, and mortgages (including ground rents) by the societies may be stated as well over one hundred millions sterling, and shows how the savings of the working classes may be affected by hasty or rash legislation on these subjects.

"I next deal with Industrial and Provident Societies, more popularly known as Co-operative Societies. By far the largest and most important of the three sections into which the group is divided —(*a*) Industries and trades, (*b*) Businesses, and (*c*) Land Societies—is the first named. Out of a total of 2779 societies making returns last year, 2264, or eighty-one per cent., carry on industries and trades. The volume of business conducted by these societies amounted to one hundred millions, this sum representing the sales of goods during the year 1906, at a cost for salaries, wages, establishment, and other expenses of eight millions. Of this latter amount three millions were expended in productive expenses and five millions in distributive expenses. The number of members in 2264 societies exceeded 2¾ millions. The balance of profit on the year's transactions amounted to £10,000,000, or ten per cent. on the value of goods sold. The members have nearly thirty-one millions invested in share capital, or an average of £13 per member; while deposits and loan capital amount to fifteen millions, and the balances of profit and reserve carried forward to 4¾ millions.

"The value of land, buildings, and fixtures used by the societies exceeds fourteen millions, while the value of goods in stock represents eleven millions sterling. These, with the balances of cash in hand, show a trading capital of over twenty-eight millions. In addition, they have investments upon various securities amounting to 22½ millions.

"In addition to these societies there are 378 societies, comprising Financial Societies, Working Men's Clubs, and societies for various purposes, having a total membership of 98,000 and assets exceeding £970,000 (1906 statistics).

"The third section is that of Land Societies. Although numerically few, their operations in purchasing and developing estates for building purposes, to be acquired by the members, are of some importance. 137 societies with 17,700 members received during the year £597,000. They purchased during the same period land valued at £33,000, and advanced on mortgage security to the extent of £167,000. Their management expenses were £15,700, whilst the net balance of profit amounted to £21,000. The share capital of £642,000, represents an average

Land and Building Societies

of upwards of £36 per member, while the Loan Capital amounted to £713,000. The land held by the societies is valued at £478,000, while advances upon mortgage show a balance due of £753,000.

"The next subject is that of Building Societies. As defined by Section 13 of the Act of 1874, their purpose is to raise 'by the subscriptions of the members a stock or fund for making advances to members out of the funds of the society upon security of freehold, copyhold, or leasehold estate, by way of mortgage.' That these societies upon the whole fulfil their object may be gathered from the Abstract of Annual Returns to the end of the year 1906, when out of a total amount of assets of incorporated societies of £55,894,000, £52,323,000, or nearly ninety-four per cent., was due on mortgage securities. During the year the 1952 societies comprising this group received twenty millions sterling, and during the same period 1454 societies advanced upon mortgage security 8¾ millions. Assuming the average amount of each mortgage to be £300, it will be seen that 29,000 persons availed themselves, in one year only, of facilities given of becoming, probably in a large proportion of cases, the owners of their dwelling-houses. The average amount of share capital standing to the credit of the members is about £68 each. In addition to this, their holding in the societies, as depositors, is very considerable.

"Another department of working-class thrift is the Trade Union. To Trade Unions the advantages of registration were extended by the Act of 1871. At the close of the year 1876, 159 Trade Unions upon the register furnished returns showing a membership of 309,000, and funds amounting to £467,616. At the close of 1906—taking ten year intervals—the number of unions had increased to 645, their members had increased to nearly 1¾ millions, while their income exceeded 2½ millions per annum; the balance of funds standing at £5,864,000."

After thus dealing in detail with the various channels which working men use to put their savings to profit, Mr. Stuart Sim summed up the cumulative results of national thrift by giving numerous tables, the totalled returns for which show (1) that 34,652 Registered Provident Societies had a membership of 19,546,586 with funds £184,149,732; and (2) that the 49,949 Banks (Railway, Trustee, and Post Office) held £426,605,383, the savings of 31,700,963 depositors. Thus the tangible proof that the working-classes as a whole possessed in no small degree the virtue of thrift was the fact that they had accumulated savings to the enormous total of £610,755,115.

A White paper issued October 1st, 1908, gives the latest returns available as to the Trustee Savings Banks in the British Isles, showing that at the year ending with November, 1907, there were 222 banks open, in which 1,780,214 accounts were running, having an aggregate total owing depositors of £52,153,594, of which £51,963,231 was invested. The actual number of deposits for twelve months was 3,629,778, and the withdrawals 2,005,625. The average amount to the credit of each depositor came to £29 5*s.* 11*d.*

TOLSTOYAN SETTLEMENT: A Tolstoyan settlement was founded as an asylum for Russian refugees in 1901 at Christchurch, Hants, by an old friend of the author, M. Tchertkoff, who was exiled from Russia in 1897. Countess Olga Tolstoy, a daughter-in-law of the great writer, has taken up her abode at Christchurch, and the colony, which fluctuates in numbers, generally averages about fifty members. All the food required, which is entirely of a vegetarian character, is grown on the surrounding land, and as various industries have been started the community is practically self-supporting. Many of the members of the settlement are engaged in propagandist work, lecturing, and taking other share in the activities of the Free Age Press, a feature of which is that none of its publications are copyrighted, this practice being followed so that its methods may be in sympathy with Tolstoy's desire regarding his own writings. (See also page 1222.)

TOTAL ABSTINENCE UNION, WOMEN'S: Founded in 1893. Object: To form a union or federation of women's temperance societies, and to promote the formation of others. Federated with the Union are societies for specializing on Nurses, Deaconesses, Teachers, Laundresses, Girls, and Babies. Official organ, *Wings*, monthly, 1*d.* President, Mrs. Servante. *Secretary:* Miss S. L. Boyd, 4, Ludgate Hill, London, E.C.

TRADE DISPUTES: (See under TRADE UNIONISM.)

TRADE RETURNS: Amplifying the statistics given elsewhere on various countries, the trade returns, to June 30th, 1908, show that Great Britain is still in front of any other country, and well ahead of her own record in 1906. Germany shows a fairly steady position, but the fluctuation in the trading of the United States is indicative of the periods of stress through which America had been passing.

In the tables, in which no exact comparison can be made, it is shown that the imports of British India were £39,878,000 in the first five months of 1908, an increase of £6,000,000, while the exports diminished by about £15,000,000, to £42,842,000. Canada's imports in the similar period fell away by some £7,000,000, while her exports rose by £1,250,000. The imports of South Africa declined from £14,311,000 in the first five months of 1906 to £10,881,000 in 1908, but the exports rose from £16,731,000 to £18,343,000, the latter figure being £1,250,000 lower than 1907. Taking imports first, we get the following results for the first six months of the last three years:—

	1906. £	1907. £	1908. £
U.K. ..	256,131,000	276,807,000	259,010,000
Germany	198,287,000	213,603,000	204,554,000
U.S. ..	132,783,000	156,516,000	108,844,000
France	113,949,000	127,388,000	121,944,000

The percentages of increase and decrease of the four countries in the trade of the first six months of 1908 compared with 1907 and 1906 are as follows:—

	Compared with 1907.	Compared with 1906.
United Kingdom	− 6·4	+ 1·1
Germany	− 4.2	+ 3·1
United States	− 30·4	− 18·0
France	− 4·2	+ 7·0

It will be seen that the United States not only shows a marked decline compared with 1907, but also compared with 1906.

The exports for the same periods are as follows:—

	1906. £	1907. £	1908. £
U.K. ..	180,594,000	206,317,000	189,993,000
Germany	140,478,000	162,581,000	160,805,000
U.S. ..	175,957,000	192,833,000	180,153,000
France	100,957,000	111,325,000	104,327,000

Decreasing Trade

With regard to the figures for the United Kingdom as compared with previous records, the summarized returns for July, 1908, show decreases—

	For month ending July 31. 1908.	1907.	Decrease.
	£	£	£
Imports	46,773,035	52,207,774	5,434,739
Exports	33,705,725	40,452,331	6,746,606
Re-exports, foreign and Colonial merchandise	6,310,928	7,388,291	1,077,363
Total	86,789,688	100,048,396	13,258,708

TOTAL 1908 TRADE TO AND INCLUDING JULY.

	1908.	1907.	Decrease.
	£	£	£
Imports	345,190,878	380,592,344	35,401,466
Exports	223,681,784	246,769,800	23,088,016
Re-exports, foreign and Colonial merchandise	45,607,259	58,937,547	13,330,288
Total	614,479,921	686,299,691	71,819,770

The Board of Trade returns for August, 1908, show a continuation of the decline. Imports fell by £6,544,396 to £42,746,051, while exports of British goods fell by £7,012,368 to £30,342,676. The loss of one working day in August, 1908, only slightly modifies these figures. The loss in exports for the eight months, January to August, now amounts to £30,000,000, made up thus—

LOSS IN EXPORTS IN 1908.

January	£700,000
February	100,000
March	1,900,000
April	3,700,000
May	5,800,000
June	4,100,000
July	6,700,000
August	7,000,000
Total fall in eight months,	£30,000,000

Analyzing the imports by great classes we get—

IMPORTS IN AUGUST AND IN THE EIGHT MONTHS ENDED AUGUST.

(Values inclusive of freight and insurance.)
(In millions of £.)

	August.			Eight months ended August.		
	1906.	1907.	1908.	1906.	1907.	1908.
Food, drink, and tobacco	21·4	21·8	18·4	157·3	159·6	156·8
Raw materials ..	14·0	14·7	12·9	133·7	163·4	133·5
Manufactures	13·3	12·6	11 4	105·3	105·3	96·0
Miscellaneous	0·2	0·2	0·2	1·7	1·6	1·5
Total imports ..	48·9	49·3	42·8	398·0	429·8	387·8

The serious fall in the imports of materials will be noticed. In August it amounted to £1,800,000; in the eight months it amounted to £29,900,000. That is evidence of a great loss of employment, whether for home or export.

On the export side of the account we get—

EXPORTS IN AUGUST AND IN THE EIGHT MONTHS ENDED AUGUST.

(Values do not include freight and insurance.)
(In millions of £.)

	August.			Eight months ended August.		
	1906.	1907.	1908.	1906.	1907.	1908.
Food, drink, and tobacco	2·6	2·3	2·1	12·6	13·8	13·3
Raw materials ..	3·8	4·9	4·3	28·3	35·4	34 7
Manufactures	27·3	29·5	23·4	203·1	230·9	202 2
Miscellaneous	0·5	0·6	0·5	3·6	4·1	3·7
Exports of goods previously imported ..	6 9	7·4	6·8	57·4	66·3	52·4
Total exports ..	40·4	44·8	37·1	304·9	350·4	306·4

Here the fall is chiefly accounted for under the heading of manufactures, and it is spread over practically all branches of industry.

Iron	Fell £1,037,000
Other metals	,, 240,000
Machinery	,, 238,000
Cottons	,, 1,853,000
Woollens	,, 851,000
Chemicals	,, 175,000
Apparel	,, 140,000

In the eight months the fall in manufactured exports fell by £28,696,000.

Taking imports and exports together, an extraordinary fall in purchasing power both at home and abroad is evident.

A more comprehensive comparison, taken back to the previous trade boom of 1900, gives us the following figures :—

AUGUST TRADE, 1900-1908.
(In millions of £.)

	Imports.	Exports.
1900	42·1	24·9
1901	40·9	24·2
1902	40·4	24·3
1903	42·8	25·7
1904	42·4	26·4
1905	46·9	29·5
1906	48·9	33·5
1907	49·3	37·4
1908	42·7	30·3

Imports in August, 1908, were thus very much on a level with those of 1900, whilst exports, it will be seen, are very much better than in 1900–1905.

The Board of Trade returns for September, 1908, however, indicated in various directions improvement in the trade of the United Kingdom. For the first time during 1908 the imports showed an increase on the month, and although a further fall was shown in exports the comparative decline in September was the lowest since March.

Appended are particulars of the over-seas trade of the month, compared with the corresponding months of 1906 and 1907. In the latter case it will be seen that there were increases in both imports and British exports :—

		− or + 1907.	− or + 1906.
Imports	£48,028,207 ..	+ £2,692,756 ..	+ £2,968,372
British exports ..	31,621,206 ..	− 3,535,114 ..	+ 1,096·053
Re-exports ..	5,287,814 ..	− 654,498 ..	− 232,949
Turnover ..	£84,937,227 ..	− £1,496,856 ..	+ £3,831,476

The volume of trade was about five millions more than in August, while the net decline, as compared with the corresponding month of 1907, had not been so low during the year. The bulk of the increase in the imports was in food, drink, etc., amounting to £2,139,002. Raw materials imported increased by £38,715, mainly owing to an increase of £385,337 in raw wool, while cotton fell off by £234,108. In manufactured articles the total increase was £516,184, the chief increases being in miscellaneous metals £284,413, leather goods £175,122, and in iron and steel £152,944. There was a drop of £140,773 in miscellaneous textiles, and another of £102,592 in machinery.

In British exports the total decrease in manufactured articles was £2,775,511, notwithstanding an increase in new ships of £1,077,217. The most serious decline was again in cotton goods, £1,043,076; the next in iron and steel, £771,070; followed by wool, £712,175. The raw material exports showed a total falling off amounting to £478,681, of which coal was accountable for £252,268. Food, drink, etc., exports were £289,216 lower.

The following table gives the totals for the nine months of the year, and comparisons with the two preceding years :—

	— or + 1907.	— or + 1906.
Imports	£435,798,328 ..	— £39,334,545 .. — £7,217,427
British exports ..	285,663,002 ..	— 33,618,162 .. + 7,608,757
Re-exports ..	57,714,780 ..	— 14,532,280 .. — 5,208,330
Turnover ..	£779,176,110 ..	— £87,484,987 .. — £4,817,000

The table shows that the average monthly decline, as against the year 1907, was over nine and a half millions, whilst that of September was under one and a half millions.

British trade was the topic of an address by Lord Brassey at the Annual Conference of the Associated British Chambers of Commerce at Cardiff on September 15th. Directing attention to the wider question of the relative efficiency of British and foreign industry, he said there was to-day contraction in every important centre of commerce, but our experience was universal. Our exports had fallen, not because our prices were excessive, nor because the quality of our goods was inferior, but because our best customers had not the means to buy. As manufacturers for export we had a long lead in 1907. Exports of manufactures from the United States had been computed at £1 14*s.* per head of population; Germany, £2 10*s.*; the United Kingdom, £5 10*s.*, in neutral markets. Germany, our keenest competitor in manufactures, had not yet come near us in the race.

TRADE AND LABOUR COUNCILS, THE YORKSHIRE FEDERATION OF: Founded in 1893. Including seventeen trades councils, with an aggregate membership of 80,000. A petition on old-age pensions was presented to Parliament in February, 1908, representing 799,750 workers. *Hon. Secretary :* Mr. W. H. Leach, 34, Rydall Terrace, Leeds.

TRADE UNIONIST TARIFF REFORM ASSOCIATION: Founded in 1904. Object: To strengthen the cause of Trade Unionism, to improve the condition of the workers in this country, and by employing the Tariff to protect them against unfair and unjust foreign competition. President, Mr. F. Hastings Medhurst. *General Secretary :* Mr. Ald. G. K. Naylor, L.C.C., 57, Chancery Lane, London, W.C.

TRADE UNION CONGRESS: (See under Trade Unionism.)

TRADE UNION CONGRESS, IRISH: Founded in 1894. Membership, 76,000, represented by a parliamentary committee of nine, elected at each Annual Congress to carry out the work remitted to them, with the full support of the Irish Parliamentary party. Chairman, Mr. Councillor M. Egan, J.P. *Hon. Secretary :* Mr. E. L. Richardson, J.P., Trades Hall, Dublin.

TRADE UNIONISM: At the Annual Trade Union Congress in September, 1908, 213 Societies, an aggregate membership of 1,776,000, were represented by 518 delegates. The total strength of Trade Unionism is shown by the return issued at the end of 1907 by the Labour Department of the Board of Trade, which gives details of 980 Employers' Associations, 1153 Trade Unions, 237 Trades Councils, ninety-three Federations of Trade Unions, six Federations of Trades Councils, three Parliamentary Committees appointed by Trades Union Congresses, 209 Conciliation and Arbitration Boards, and three Free Labour Associations. Of these, according to returns issued in 1908, by the Chief Registrar of Friendly Societies, 645 are registered, the membership being 1,750,000 and the income over two and a half millions sterling. At the end of 1906, continues the return, the balance of funds stood at £5,864,000. The total trade-union membership is approximately returned at two millions in September, 1908.

The ninth annual report of the General Federation of Trade Unions (*q.v.*), issued on June 18th, 1908, sho that 122 trade unions belong to the Federation, showing an aggregate membership of 689,674. Financially the Federation had made good progress, showing income £37,203 14*s.* 3*d.*, an increase of £7041 10*s.* 4*d.* over the previous year, whilst the Reserve Fund was £162,210 8*s.* 9*d.*, or £10,068 16*s.* 4*d.* more than 1907.

It is estimated that the number of workers capable of organization in the United Kingdom are represented as under—

Number.

	Men.	Women.	Together.	Percentage of workers.
In Industry, Trade, and Communication ..	4,600,000	1,600,000	6,200,000	86·11
In Agriculture	900,000	100,000	1,000,000	13·89
Totals ..	5,500,000	1,700,000	7,200,000	—

Trade Disputes

The Trade Disputes Act, which passed through Parliament in the autumn session, 1906, had the effect of protecting unions from litigation in consequence of members being called out on strike, thus reversing the Taff Vale decision in August, 1900.

It is argued in some directions that the striking diminution evidenced in the quinquennium period given below was due in some degree to the 1900 decision, and that this later enactment has set the pendulum swinging again in the other direction—

Five Years' Trade Disputes.

Year.	No. of trade disputes.	No. of workpeople affected.	No. of working days lost by the disputes.
1902 ..	442	256,667	3,479,255
1903 ..	387	116,901	2,338,668
1904 ..	355	87,208	1,484,220
1905 ..	358	93,503	2,470,189
1906 ..	488	217,773	3,028,816

How the Trade Disputes have been Settled.

Year.	In favour of the workers. (Per cent.)	In favour of the masters. (Per cent.)	By compromise. (Per cent.)	Indefinite. (Per cent.)
1902 ..	24	47	28	—
1903 ..	23	48	29	—
1904 ..	17	48	31	3
1905 ..	19	46	30	1
1906 ..	31	37	31	1

Parliamentary Representation

The question of the legitimacy of using Trade Union Funds for the furtherance, by propaganda, or payment of members, of their aims came acutely to the front in July of 1908, as a result of a decision of Mr. Justice Neville in the Law Courts. The point arose out of an action by a member of the Amalgamated Society of Railway Servants consequent upon a rule just previously made binding Parliamentary candidates adopted by the union to accept and sign the conditions of the Labour Party. The Court was asked (1) to hold the rule invalid on a technical point, and (2) to declare the policy of contributing to the Labour Party *ultra vires*. Mr. Justice Neville, in a considered judgment, decided in favour of the society on both points, the latter of which settled a

question of vital importance in trade union politics. In a leading article the London *Daily Chronicle* declared that "a decision in the opposite sense would have arrested, or impeded, the trend of trade unionism towards political and party affiliation. It would have confined the powers of trade unions to distinctively trade purposes, or, at any rate, to political action directly limited to the benefit of the several trades. The actual decision, declaring the affiliation and application of funds to be not *ultra vires*, leaves trade unionism at liberty to combine with, and financially to support, any political party it chooses."

Mr. Justice Neville gave his dictum thus: "Given the right to spend trade union money on representation in the House of Commons, how it was spent is a question of policy with which the Court would not concern itself."

International Aspect

According to the returns of the General Federation of Trade Unions issued June, 1908, the number of Trade Union members in industry, trade, communication, and agriculture in the countries enumerated are—

Trade Union Members.

Country.	In Industry, Trade, and Communication.				In Agriculture.				Together.		
	Men.	Women.	Together.	Percentage of Workers.	Men.	Women.	Together.	Percentage of Workers.	Men.	Women.	Together.

French Unions.

*According to M. Metin (*Chef Adjoint au Cabinet du Ministere du Travail*) there were in France, on January 1st, 1907, 5322 unions of workmen, with 896,012 members, of whom 79,260 were women; also 187 federations of unions, grouping 3675 unions and 752,362 members; and 131 labour exchanges, comprising 2586 unions of workmen with 455,790 members.

These figures showed that in twelve months the total number of Trade Unions had increased by 1130, and their membership by 149,240; the Labour Exchanges had added six to their number, while 105 more syndicats and 33,454 more members had been added to the total already affiliated to these exchanges.

The two sections of French Trade Unionism, the "reds" on the one hand and the "yellow" and Catholic on the other, lead existences entirely separate. The "red" Trade Unions are the most active and numerous, and are closest in resemblance to the Trade Unions of England. The "yellow" unions or syndicats are made up of "scabs," this appellation being applied in France to all those organizations which work in accordance with the will of the employers. They are not very numerous.

Among the societies which are not "red," there are also the Catholic syndicats, which are fairly numerous in certain regions. These associations are in general mixed bodies, in the direction of which the employers take a part, either directly or through the intermediary of the clergy.

In practice, the relations existing between the workers' organizations and the public powers in France are displayed in the following manner:—

At the Ministry of Labour there has been instituted the Upper Council of Labour, which is composed of representatives elected by the workers' societies and of delegates chosen by the employers, each of the two groups being composed of twenty-seven persons; five deputies are sent by the Chamber of Deputies, and three senators from the Senate. This Council, which is presided over by the Minister, passes resolutions and examines propositions relating to legislation for the working classes.

In Parliament there does not exist in France any Labour Party, properly called, as distinct from the Socialist Party. The majority of the working men representatives are divided between the two Socialist groups—the united or independent.

The principal parliamentary measures of interest to the working classes have been: The institution in October, 1906, of the Ministry for Labour and Social Reform (*prévoyance*); the reduction to nine hours of the Working-day in Mines; that for an extension of the powers of the ten-hour day enactment in general industries; the Approval of the Berne International Agreement, which forbids night work for women in the greater part of the States of Europe; the Suppression of the use of White Lead in Paints. Also, may be included, a system of old-age pensions, which are to be

obtained by levying two per cent. on the wages of the workmen, collecting a similar amount from the employers, with the addition of a bonus to be granted by the State, making a total pension, in normal times, of 360 francs (£16 4 *s.*) per annum.

International Agreements

The question of International Agreements on labour legislation was the topic of one of the discussions of the British Association at their annual Conference in September, 1908, at Dublin. The opener was Professor E. Francke. He said that the question how to effect by means of international conventions a uniform adjustment of the laws and regulations that are intended to serve for the protection of life, health, and morality of industrial workpeople is as old as the laws themselves for the protection of the working-classes. England was the country of origin of both. In the spring of 1890 the delegates of thirteen European countries—amongst them Germany, Great Britain, France, Austria, and Italy—met together at Berlin in order to consider conditions of labour. In August, 1897, a Workmen's Congress, held at Zurich, which was attended by representatives of a great number of countries, and another congress at Brussels in October of the same year, demanded the establishment of an international office for the protection of workpeople. This resulted in a representative gathering from many countries in 1900 at Paris in order to found the International Association for Labour Legislation (*q.v.*) for the legislative protection of workpeople. The seat of this Association is Basle, twelve countries as sections adhere to it—Switzerland, Germany, Great Britain, France, Italy, Austria-Hungary, Belgium, Holland, Denmark, Spain, and the United States of America. Every two years the delegates of the Governments and sections meet for the purpose of discussing labour questions—the latest taking place at Lucerne, September 27th to 30th, 1908, the subjects for discussion being prohibition of nightwork for youths; children's work and protection of children; regulation of home-industry; introduction of measures against dangers from the use of poisons (lead); international accident insurance; maximum length of workdays. On all these the aim is to procure the conclusion of new international treaties.

It will be seen, therefore, that industrial and trade-union questions have gathered added importance of late in the estimation of men of science, not only in their general economic aspect, but in regard to the workings of trade unionism in many industries. Several questions of outstanding interest in addition to that already referred to were brought forward.

Fair House

This term prevails in the printing trade to indicate a firm who employ Union men and pay "fair wages." In a case before Justice Grantham, which occupied three days in the hearing, and in which a firm of printers sued thirty-five men for leaving employment without notice, the case was decided in favour of the masters. The case hinged around a "fair house" dispute, the firm in question (Hammond & Co., London and Birmingham) employing both union and non-union men. It was contended by Hammond & Co. that the Compositors Union had endeavoured to coerce them into employing only union men and that the leaving of the men was part of the plan. Being unable, under the Trade Disputes Act of 1906, to obtain redress from the Union, they took action against the men individually and won, damages to the amount of £600 being awarded. One of the points of objection of Hammond & Co. was the rate of overtime. This they alleged was unfair to customers, and in support of their case included the following table (which is reproduced without comment) in a pamphlet, "Trade Unionism," which they issued to give their views on the question:—

"For overtime after 6.30 p.m. the Trade Union arrangements are as follows: for "half a night," that is, from six-thirty till twelve, we are required to pay 7*s.* 3*d.* which was got at in the following manner. From six-thirty till twelve is only 5½ hours, but the Trades Union do not recognize half-hours, so the 5½ hours have to be paid for as six full hours. From six-thirty till seven, however, the workman is required to have time for tea before starting on his overtime, which reduces the time to five hours, the man being entitled under the Union regulations to claim payment for the half-hour as work done while he was taking his meal. From ten till ten-thirty he was to have another half an hour allowed to him for supper as work done, and to be paid for, so that for the half night's overtime, there was 4½ hours net work for 7*s.* 3*d.*, which equals about one shilling and sevenpence halfpenny per hour. Assuming that the mail trains for certain publications required the men to work till either one a.m., this exceeded the half-night, when we had no alternative very often but to pay for the full night through owing to this single hour's extra work, and the price demanded for the full night was sixteen shillings and fourpence. Assuming the workman was only required till one a.m., which was often the case, we then got only 5½ hours' work for this 16*s.* 4*d.* The same 5½ hours' work, if done in the day time is worth 4*s.* 1*d.*, but on overtime, 16*s.* 4*d.*

A summary, therefore, of Trade Union charges for one hour's work, worked at different times of the twenty-four hours, shows—

	per hour. *s.*	*d.*
For work between eight a.m. and six-thirty	0	9
For work between six-thirty p.m. and twelve midnight	1	7½
For 5½ hours, six-thirty p.m. till one a.m., costing 16*s.* 4*d.*	3	0
If the Trade Union charge is 16*s.* 4*d.* till one a.m. and 7*s.* 3*d.* only till midnight, the one hour twelve till one a.m. costs ..	9	1
But as 4½ hours' day work at 9*d.* costs only 3*s.* 4½*d.* as against the 16*s.* 4*d.* for 5½ hours' night work, the difference is for the one hour	12	11½

The Trade Union retort is, of course, that the firm can employ the man for the whole night if they choose, or that they should employ more men and so, by obviating overtime, get their work done at the lowest "fair" rate.

Practical Questions

Sir Christopher Furness's offer, made in October, 1908, and referred to under PROFIT SHARING (lxvii), provoked much comment. The first alternative proposed that Trade Unions should acquire and run two of the shipbuilding works in which he was interested. Had the offer been accepted it would have formed a practical experiment of undoubted value, which would have been watched with much interest. Indeed, there are not wanting those who maintain that Trade Union Congresses might profitably consider the practical and administrative sides of industrialism, or, to use the words of one writer, "the craft side of their demands." This particular essayist continues his argument into other relevant issues. Thus he submits as legitimate questions:—

"They have in the past made clear their political necessities; let us now know what, in their view, are the best modes of efficient production. Ought the nation to continue the factory system or to return to the small workshops; are we getting the best work out of ourselves by our open market, or should we adopt measures of protection; is the unlimited use of machinery good for industry as distinct from capital; ought prices to be fixed or subject to incalculable fluctuation; should workshop control be in the hands of commercial travellers or of master workmen? These are the real problems of industrialism, and, problems, too, which no mere socialist can solve. For their solution the nation will have to depend upon the experience of Trade Unionists."

The general history and progress of Trade Unions are detailed on pp. 1224 to 1236, included in which is the position of trade unionism throughout the world.

PRINCIPAL TRADE UNIONS OF THE UNITED KINGDOM.

Compiled from particulars furnished, September and October, 1908.

Where statistical information is not given, such had not been furnished before closing for press.

Name of Society.	Number of Members.	Accumulated Funds.	Name and Address of Secretary.
		£	
Actors' Union	793		K. Blackmore, 49, Bedford Street, Strand, London, W.C.

TRADE UNION LEAGUE, WOMEN'S: Founded in 1874. Objects: (1) The organization of women into Trade Unions. (2) The advancement of legislation for the amelioration of the general working conditions of women. (3) The institution of a legal minimum wage. (4) To help in the administration of existing laws for the protection of women's labour. Official organ, *The Women's Trade Union Review*, quarterly, 6*d*. President, Miss Gertrude Tuckwell. *Secretary:* Miss Mary R. MacArthur, Club Union Buildings, Clerkenwell Road, London, E.C.

TRAMWAYS, ELECTRIC: No other branch, perhaps, of municipal enterprise has made such rapid progress during the last decade as tramway electrification. Birmingham was the first city to obtain general powers to lay tramways (1861), and Huddersfield the first to obtain Parliamentary sanction to work them on their own account. Glasgow is often quoted as being a model of municipal tramway running and administration. That this traffic is profitable may be gathered from the fact that in 1906 a total of £240,041 was paid over to relieve the rates, and this sum is substantially increasing each year.

In London (*see* LONDON) the conduit system prevails, but in the provinces, except in the few cases where the stud system is installed, the municipalities have, in by far the greater majority of cases, adopted the overhead system.

In Glasgow the municipality own the power plant as well as the track and stock. The trams have always been municipally owned. Up to 1907 they had laid and in operation 88·32 miles of route, with 543·98 average cars running. During the year they carried 224,063,098 passengers, the total receipts were £895,841 (£75,000 more than 1905–6), and contributed £35,000 to the rate fund.

In the Provinces

The tramways in the municipalities of Wales are fewer in comparison, but in Cardiff there is 17·61 miles in successful operation, carrying (1907) 24,438,164 passengers at a net profit of £4405, which, however, was not applied to rate relief.

Manchester is progressing rapidly, and expects to ultimately have seven hundred cars running. In 1907, although construction only started in 1901, it had 95·89 miles of street route working, carrying 143,264,501 passengers, producing £719,673, which gave £107,039 surplus after paying interest and charges. Of this, £87,827 was applied to depreciation and reserve funds, and £59,212 for the relief of the rates.

Although the Corporation of Birmingham obtained general powers to lay trams in 1861, it leased lines to private companies until January 4th, 1904, when the first municipal electric tram ran; and from then to January, 1907, electrification actively proceeded, with the result that over fifty-six miles of track was then in operation, and options were held for ten miles more, the leases of which fall in in 1911. Accounts for the year ending March 31st, 1907, which, however, only included three months' working of the full system, showed receipts £117,122, and working expenses £64,778. On January 1st, 1908, the traffic receipts had risen to £5500 per week from 270 cars.

Twenty-three distinct routes are in operation in Liverpool; and Parliamentary powers obtained for forty miles more single track. The streets-length covered in 1906-7 was 57½ miles, the passengers carried during the year 122,094,528, and the total receipts £571,216. This resulted in £27,586 being contributed to the rates.

Considerable discussion has taken place on the stud system owing to a decision in July of 1907 by the London County Council to use it for a three-mile length of double track from Aldgate to Bow, whereas the remainder of the council's trams are on the conduit system. The stud system is in successful operation at Wolverhampton and Torquay, and is also working in Paris. It is argued that a construction saving of £5000 per mile is effected by this method. The experiment was not so successful in London as elsewhere; indeed, within a few weeks of the line being opened in the late summer of 1908, the council decided to revert to horse traction, pending conversion to another electrical system.

The Stud System

TRAMWAYS OF LONDON: (See under LONDON.)

TUBERCULOSIS: Many authorities have pointed out the intimate connection between poverty and this disease. It is noted that while poverty is perhaps the chief predisposing cause of consumption, the disease is in turn a great cause of poverty, as it is most prevalent between the ages of fifteen and forty-five or fifty, the working and wage-earning time of life when the chief supporter of the family, whether male or female, ought to be at the best. Out of four thousand consumptive paupers under the care of Dr. Nathan Raw, in Liverpool, into whose history he made careful inquiry, sixty per cent. became paupers because they were phthisical, and not phthisical because they were poor. The direct and indirect loss to the country is almost incomputable.

The Local Government Board have been strenuous in combating the spread of consumption, and on September 30th, 1908, they decided to issue an order compelling all poor-law medical officers to notify sanitary authorities of all cases of phthisis occurring amongst parochial patients. Previously it had not been included in the list of notifiable infectious diseases. It is now the duty of poor-law medical officers to report to medical officers of health, as the representatives of the sanitary authorities, in cases of consumption among paupers.

This new order also renders it obligatory on other poor-law officials to notify changes of address of parochial patients. A difficulty has been the want of adequate provision for the congregate treatment of consumptives, so that patients may be drawn from their homes and thus a very prolific cause of spreading the disease removed. But little has been done so far, apart from the large institutions, such as Ventnor, the open-air sanatoria, such as the King's experiment at Caterham Valley, and the Central Sick Asylums Board's institution at Hendon.

New Steps

There are two existing methods of dealing with consumption. The first is by sending the patients in the early stage to the sanatoria which have been established in different parts of the country, and the second is through the medium of the workhouse infirmaries.

A suggestion has been made to use the Carshalton Southern Hospital, originally a convalescent home with eight hundred beds and belonging to the Metropolitan Asylums Board, for such a purpose. Another factor making for diminution of infection-danger is the recent general byelaws against expectoration in public vehicles, etc.

Deaths from this disease exceed those of all other forms of infection put together. In England and Wales alone there are sixty thousand deaths annually from consumption and other forms of tuberculosis. In Ireland, according to returns published August 25th, 1908, no less than 11,679 deaths occurred in 1907 from phthisical diseases, out of 77,334 deaths from all causes, an alarming percentage. In Scotland for 1907, in eight principal towns only, there were 6901 deaths from consumption.

Deaths

Notwithstanding the still very high death-rate, a vast improvement has taken place during the last forty years. In addition to more scientific methods and improved medical knowledge, this may be attributed to the better disinfection of dwellings wherein the afflicted have lived and died, and generally speaking, better housing; ample

space, with sunlight and ventilation; abundant wholesome, well-cooked food; abstinence from stimulants; and better habits of domestic and personal cleanliness.

Decrease

In his report issued August, 1908, the Registrar-General of Births, Marriages, and Deaths refers thus encouragingly to the decreasing mortality from phthisis: "The continuous decline of phthisis (consumption) mortality has been adverted to frequently in the annual reports, and the present research shows that most of the occupations have in varying degrees shared in the decline. Even clergymen and farmers, who have experienced an extremely low mortality from this disease in the previous decennial, experienced a still lower mortality in the recent period."

In Germany the matter is dealt with on a wider and more practical scale. A large number of sanatoria are built and supported entirely by the insurance societies, they having discovered that it is cheaper to keep their policy-holders in health.

According to German official returns, more than £1,650,000 has been utilized for the organization of sanatoria in connection with the invalidity insurance, and more than £8,000,000 in the construction of hospitals and convalescent homes among other ameliorative achievements.

TURKEY: Reference is made elsewhere to the Young Turks' movement which resulted in the restoration of a Constitution by the Sultan, by an Iradé issued on July 24th, 1908, ordering the Valis to proceed immediately to the election of members of a Chamber of Deputies. An Imperial rescript was also published on July 26th, pointing out that, owing to the condition of things previously prevailing, the Constitution could not then be applied; but, now that the time had arrived, the Sultan expressed his pleasure at being able to apply it, and his hope that the people would co-operate with Parliament in assisting the Government and their Sovereign. The rescript ended with an expression of his Majesty's thanks for the popular manifestations of loyalty. A general amnesty was also proclaimed.

A new Ministry, with Kiamil Pasha as Grand Vizier, was appointed on August 6th, replacing the old nominees of the Sultan by Ministers more in keeping with the liberal spirit animating the Government. Active schemes of administrative departmental reform were at once proceeded with, a determined attempt being made to cut down expenditure to the necessary minimum by the abolition of sinecures, the prevention of pension frauds, and the reduction of the pay of many of the higher officials, who were receiving larger salaries than those paid to the Ministers of any other European State. It was decided to suppress the subventions to foreign newspapers and the funds for political espionage, formerly entrusted to the Ottoman representatives abroad. Further, the military service was thrown open to all citizens of the Empire without distinction; and a higher military board was formed for the preparation and application of new army regulations and schemes of national defence. An official announcement was also made stating that the Sultan had agreed to contribute to the cost of construction of new Houses of Parliament from the Civil List. Important reductions were made in the household of the Sultan, and lands and moneys improperly acquired by ex-favourites and ex-Ministers were restored to their rightful owners. An important step, and one which created the best possible impression in all circles, was taken by the Government in ordering the Minister of Police to re-arrest all bandits, robbers, and those condemned for crimes at common law, who had been liberated by the previous Ministry.

Educational Campaign

One of the principal difficulties confronting the Young Turks lay in the profound ignorance of a large portion of the Mohammedan population of the Empire, which was entirely incapable of realizing the significance of the political transformation, and in some instances appeared to believe that the new state of things implied the virtual cessation of all government. To meet this difficulty the Young Turks organized an educational campaign for the purpose of enlightening the multitude in regard to the benefits of the Constitution and the privileges which they were now called upon to exercise, a number of emissaries being despatched to preach the gospel of constitutionalism in the Asiatic Provinces and in various parts of Albania and Macedonia.

The financial position of the country naturally gave occasion for considerable misgiving, and the *Hellenic Herald* in August thus summarized the situation:—

"The Treasury is empty. It is hoped, nevertheless, that by raising loans and effecting economies, it will be possible to find the sums urgently needed for the expenses of administration till the meeting of Parliament, to which a statement of the financial situation will be submitted. While the suppression of abuses will certainly benefit the revenues, the increase will be more than counterbalanced by the necessary expenditure of the revenue-earning administrations. The Cabinet hopes that the finances will in time be put on a sound basis by improvements in the method of collecting revenue, the revision of certain commercial treaties, and the development of agriculture and commerce, schemes for which will be laid before Parliament."

Regarding the floating debt, the *Times* of August 28th said:—

"The question of what is the total floating debt of Turkey is becoming one of considerable importance in view of the possibility of a foreign loan in the near future and the certainty that proposals to this end will be submitted to Parliament by the Cabinet. The Ministry of Finance is understood to estimate the floating debt at £7,000,000, but this estimate, though double of that favoured a few days ago in official circles, is regarded as far below the mark by competent European authorities."

The thirty-second anniversary of the Sultan's accession was made the occasion of great popular demonstrations of loyalty, and the Turkish press congratulated the Sultan upon the fact that the illumination and decoration of the houses and streets, which were formerly compulsory, had become a voluntary expression of the nation's loyalty. An important change in the attitude of the Sultan towards the Heir-Presumptive, Reshad Effendi, took place. The latter had been practically a prisoner, but under the new *régimé* he was desired to begin to make himself acquainted with the affairs of State, show himself in public, attend military manœuvres; in a word, act like a constitutional prince.

U

UNEMPLOYMENT: The problem of the unemployed continues to be treated as one of great importance. In an article in the *Contemporary Review* for April, 1908, Mr. W. H. Beveridge analyzed in an exhaustive manner the economic causes by which there continued to be so large a total of workless workmen, and outlined a plan which, in his estimation, would contribute to a diminution of the alarming total of the unemployed.

"Not only," postulates Mr. Beveridge, "in the last few years, but over the whole period for which accurate economic records are available, there has been a rise in the standard of wealth and of production. Wages

have increased ; the consumption of raw material in all the principal manufactures has grown more rapidly than the population ; the average income and the average productivity of the individual citizen are higher than they ever were before. The terrors of over-population—of a rate of births out of all relation to the rate of industrial expansion, of each fresh comer finding room only at the cost of diminishing the room of others—have been laid to rest by the apparently limitless improvements of manufacturing methods and organization. Industry still expands not less rapidly but more rapidly than the population. Each fresh comer finds on an average not less but more working and living room than his predecessors. Yet with all this there comes the perpetual cry of some who find no living and working room at all. While the number of those who can and do obtain employment rises endlessly, the number of the unemployed never falls to zero.

"The suggestion is inevitable, that there can be no such thing as genuine unemployment. If there are not too many workmen in the country, every man who really wants work must be able to obtain it. Those who fail to find room while fresh room is opening out all around them must be men either unfit or unwilling to do so. They must be 'unemployable'—the inefficient, the lazy, the sick and infirm. This suggestion, however, runs counter to facts at least as incontestable as those of the growing wealth and productivity of the nation. It cannot be supposed that the thirty thousand members of highly skilled and organized trades who at the present moment are returned as unemployed, and for the most part in receipt of out-of-door pay from their unions, are all unemployable. It cannot be suggested that the employers who write to distress committees, as they do write in hundreds and thousands, giving the characters of men now out of work but formerly employed by them, are all in a conspiracy of deceit. Unemployment is not to be explained away as the idleness of the unemployable. As little can it be treated as a collection of accidents to individual workpeople or individual firms. It is too widespread and too enduring for that. There is no general want of adjustment between the natural increase of the people and the expansion of industry, between the rate of supply of fresh labour and normal growth of the demand for it. There are specific imperfections of adjustment which are the economic causes of unemployment.

"The organization of the labour market is not a complete remedy for unemployment. Yet the question may fairly be asked whether every other

One Remedy

of the remedies commonly applied or proposed is not either impossible or useless or dangerous without it. The elaboration of this question would extend the present article beyond all due limits. It must suffice to repeat and to summarize in the fewest words possible the principal services which an efficient system of labour exchanges may be expected to render and the objects for which it appears indispensable.

"1. The organization of the labour market, by public or private action, by voluntary agreement or under legal compulsion, is necessary for the de-casualization of employment. It is not possible for each business to employ only regular men. It is possible and necessary for every business to take all its irregular men from some common exchange in touch with other businesses, and administered with the object of giving all its clients a sufficiency of work, if not under one employer, then under many in succession.

"2. The organization of the labour market, though it cannot in times of depression make work, can even in such times reduce unemployment by abolishing all unemployment that is merely local in character. It can prevent men from being out of work in one place while employers are vainly seeking them elsewhere.

"3. The organization of the labour market is necessary for any drastic treatment of vagrancy. The excuse of the habitual vagrant is that he is looking for work. A national system of labour exchanges, using the post office, the telephone, and the railway, will gradually relieve the habitual vagrant of the excuse, and the decent workman of the demoralizing necessity, for going blindly on the tramp.

"4. The organization of the labour market is indispensable as a test of unemployment in the mass and in the individual. It alone can prevent measures for the relief of temporary distress from encouraging men to remain in trades or places in which they are not wanted, and so becoming measures for the perpetuation of chronic distress. It alone can record accurately the beginning, end, and depth of industrial depressions. It alone by putting every man at once in touch with all the work that is to be had can safeguard against abuse of systems of insurance against unemployment or of honourable assistance to the unemployed in any other form.

"5. Labour exchanges in direct connection with the elementary schools are needed in order to organize and to guide the entry of boys and girls into industrial life, to give each a wider choice of the work for which he or she is best fitted, to study and to influence the character of the demand for youthful workers, to accumulate for the formation of public opinion or the framing of laws information as to the careers offered by various occupations.

"From some points of view the organization of the labour market is the logical extension of principles advocated by many different schools of

Market-places for Labour

thought. If the principle of the living wage means anything, it means not simply a minimum rate of pay per hour, but also a minimum average number of hours in the week and year. If the attack upon unorganized charity and casual relief is not to be wasted, it must be repeated in the industrial sphere ; the process by which indiscriminate giving produces a race of beggars has an exact parallel in the manufacture of casual labourers by the offer of casual employment. If there is economic advantage in having known market-places for corn or wool or stocks, there must be the same sort of advantage in having such market-places for labour. Labour is the only commodity in the world which still finds a buyer only, or as a rule, by being hawked from door to door. The wastefulness of this antiquated method is obvious where, as is the case in skilled trades, an employer has sometimes to wait for a suitable workman. The waste is even greater, though unfortunately less obvious to the employer, in those occupations in which as many men as are wanted can be got at once wherever they are wanted, *i.e.* in which all the waiting is done by an immense unorganized reserve of men.

"From other points of view the organization of the labour market will be decried as a mere palliative. Yet those who are prepared so to describe it cannot do better than assist the palliative to demonstrate its own insufficiency. For the organization of the labour market at least differs fundamentally from most palliatives, in that its effect must be not to cover up, but to bring into stark prominence, the real problem, whatever that may prove to be. If those Tariff Reformers and Socialists are right who assault the existing industrial order at the one point at which it appears to the naked eye impregnable ; if, in fact, the root of the disease is that industry does not grow fast enough, and needs stimulating by the removal of foreign competition, or enlarging by the suppression of private enterprise, they can best prove their case by supporting a proposal which will force into the open the growing surplus which industry cannot absorb. If those are right who find the root of the disease in personal inefficiency, they cannot but welcome a plan for abolishing the half-places of industry into which inefficiency slinks, and in which it is perpetuated. The proposals

here made are first steps upon which all or nearly all may agree, however they differ as to the next step."

The 1905 Act

An experimental attempt by Parliament to cope with the unemployed problem was made in 1905 by the Unemployed Workmen Act, passed August 11th, 1905. The Act provided for the establishment of a distress committee of the council of every metropolitan borough in London, consisting partly of members of the borough council and partly of members of the board of guardians of every poor-law union within the borough and of persons experienced in the relief of distress, and a central body for the whole of the administrative county of London. Provision was also made for the formation of similar committees for provincial areas. The main terms of the Act were as follows :—

The distress committee shall make themselves acquainted with the conditions of labour within their area, and when so required by the central body shall receive, inquire into, and discriminate between any applications made to them from persons unemployed : provided that the applicant has resided in London for not less than twelve months immediately before the application.

If the distress committee are satisfied that any such applicant is honestly desirous of obtaining work, but is temporarily unable to do so, and consider that his case is capable of more suitable treatment under this Act than under the poor law, they may endeavour to obtain work for the applicant, but the distress committee shall have no power to provide, or contribute towards the provision of, work for any unemployed person.

The central body shall superintend and, as far as possible, co-ordinate the action of the distress committees, and aid the efforts of those committees by establishing, taking over, or assisting labour exchanges and employment registers, and by the collection of information and otherwise as they think fit.

Expenses may be incurred by the central body in aiding the emigration or removal to another area of an unemployed person and any of his dependents ; and expenses may be incurred by the central body in relation to the acquisition, with the consent of the Local Government Board, of land for the purposes of this Act.

No such contribution by a council shall in any year exceed the amount which would be produced by a rate of one halfpenny in the pound calculated on the whole rateable value of the borough, or such higher rate, not exceeding one penny, as the Local Government Board may approve.

The provision of temporary work or other assistance for any person under this Act shall not disentitle him to be registered or to vote as a parliamentary, county, or parochial elector, or as a burgess.

The Local Government Board may make regulations for carrying into effect this Act, and may by those regulations, amongst other things, provide for facilitating the co-operation of any body or committee having powers under this Act for any area with any other body or committee, or with any local authority, and the provision of assistance by one such body or committee to another ; and for applying, with the necessary adaptations, to a distress committee having the powers of a central body regulations relating to a central body ; and for the holding of local inquiries by the Local Government Board for the purposes of this Act, and for requiring returns to be made to the Board by any body or committee having powers under this Act.

It was determined that the Act should continue in force for three years from the date of the passing thereof, and no longer, unless Parliament otherwise determined.

The Act also applied to Scotland and Ireland.

Notwithstanding the fact that it was his own Bill, the Rt. Hon. John Burns made a promise on behalf of the Government to amend the Act, which in practical working had been found to present certain difficulties desirable of alteration. On being called into question in the House of Commons on March 27th, 1907, in this respect, he explained that he "told the House fifteen months ago, and again eight months ago, that pending the report of the Poor Law Commission expected at the end of 1908, whose business it was to see whether the Act should be renewed or not, the Government thought that the best thing to be done, especially as they had had no experience of the Act, was to provide the money and the means by which the Act might be carried along during its experimental period and while the subject was under the consideration of the Poor Law Commission. They, therefore, decided not to amend the Act, but to provide £200,000 with which to work the Act ; and, so far, of that amount £106,000 had been disbursed. There was no single distress committee that had a scheme of work but had had more money than was necessary for the purposes of that scheme. All of them had at this moment a small balance in hand, and nearly all had refused to use their rating power to the extent they ought to have done, in order to bring local activities into relationship with Imperial help."

The Funds Available

In regard to the expenditure of the funds provided by the Parliamentary vote of £200,000 above referred to, made to the committees under the Act in 1906, it may be noted that during the following winter the central body organized eight schemes which provided work for 3500 men for varying periods from eight to sixteen weeks at a cost of £50,000. The reports of the whole of the distress committees for the four winter months, December 1st, 1906, to March 31st, 1907, showed that a total of 51,422 applicants were given employment relief amounting to an aggregate of 522,321 days, or 10·1 days per head per month ; the wages earned amounting to £79,614, or £1 10*s.* 10*d.* per head. At March 31st, the names of 8130 applicants for employment stood on the books of the distress committees. Speaking generally, the figures given did not include a large percentage of skilled workmen, of whom an average of about 30,000 were out of work in the same period.

During the ten months from December 1st, 1906, to September 30th, 1907, the number of applicants registering for employment at the fifty Metropolitan and Provincial Labour Bureaux was just upon 120,000. Of these the Bureaux found occupation for over 30,000, and were the means of directing many more to likely quarters of employment.

The Queen's Interest

One of the features of the unemployed problem has been the interest taken by Queen Alexandra, who has always evinced a keen practical concern in the Mansion House scheme, by which employment has been found in Royal parks and public open spaces in Municipal and Government improvements, so as to, in some measure, alleviate the distress. The special "Queen's Fund" during the time of distress in 1907 received and disposed of £150,000 in private relief and employment.

Speaking on employment on February 7th, 1908, the Rt. Hon. Winston Churchill discussed various methods put forward for dealing with the unemployed question. In his opinion the question of unemployment was the greatest of the day. The people never complained without terrible cause, and they had to solve the question of the crying need of a man who found himself unable to get employment. They had, however, to fight wild and deluded remedies, but must not stop their ears to the real cry which rang through it all.

"Right to Work" Bill

The reference in this speech is doubtless to a remarkable Bill introduced by the Labour-Socialistic party, which was popularly termed "The Right to Work" Bill. This was before the House of Commons on March 11th, 1908, but rejected by a majority of 241 against ninety-five. Arguments which led to its rejection may be

summed up by saying that the consensus of opinion was, that the remedy proposed would have been as bad as the disease it was desired to cure. By "the right to work" clause, which was characterized as "the kernel of the Bill," every workman registering himself as unemployed would have had to be provided by a local authority with work at Trade Union rate of wages, or failing that with money enough to maintain himself and family.

The debate in the House of Commons was very long and heated. A summary of the principal speeches follows—

Mr. P. W. Wilson, in moving the second reading of the Bill, said that the Bill established regular unemployment committees for all authorities, and thus a uniform policy was applied to the whole of the country. The first duty of the committees was to register the unemployed, and that register would be in itself almost a ready-made universal system of labour exchanges. The work clauses dealt with two fairly distinct classes of work—work done by the national authority and work done by the local authority.

Mr. Ramsay Macdonald, seconding the motion for the second reading, said that this was the first time the problem of the unemployed had been faced from top to bottom. This Bill, like the Trade Disputes Bill, had behind it the combined forces of labour throughout the country. He wished to say at once that from the point of view of the Labour Party—by which term he included all organizations of labour—the kernel of the Bill was Clause 3. This clause provided that—

"Where a workman has registered himself as unemployed, it shall be the duty of the local unemployment authority, subject to conditions hereinafter to be imposed, to provide work for him in connection with one or other of the schemes hereinafter provided, or otherwise, failing the provision of work, to provide maintenance should necessity exist for that person and those depending on that person for the necessaries of life: Provided that a refusal on the part of an unemployed workman to accept reasonable work on one of these schemes, or other employment upon conditions not lower than those that are standard to the work in the locality, shall release the local unemployment authority of its duties under this section."

The movement for dealing with the unemployed must go more and more in the direction of Clause 3. In 1907 the applications received under the 1905 Act from unemployed numbered 87,001. Of the 60,416 who passed the investigation, 36,000 were given employment. This was miserably inadequate.

Opposing Views

The Rt. Hon. John Burns said, that to see whether the Bill was popular with those who knew most about it, the Tottenham Urban Council sent circulars to all local authorities throughout the country with regard to it. What was the response? Resolutions in support of the Bill were received from three town councils out of 322, from sixteen urban district councils out of 818, from four rural district councils out of 671, and from one board of guardians only out of 657. The Central Poor Law Conference was practically unanimously against it. The Bill was impossible, unworkable, and a delusion and a snare, and he asked the House to vote against it.

The Prime Minister (Rt. Hon. H. H. Asquith) said "the real issue before us is whether the House is going to recognize, for the first time in the history of Parliament, this principle of the right to work and the obligation to provide work. If you once recognize it, I venture to say it will lead to conclusions little dreamt of or suspected by many people to-day, and which, if carried to their practical consequences, will be prejudicial to no class in the community more seriously than to the working class."

A further Bill on similar lines will be brought forward in the early session of 1909, or possibly before then.

Mr. G. R. S. Taylor, writing in the *New Age* of March 21st, 1908, respecting this rejected "Unemployed Workmen Bill," which was its official title, argued that it laid down that the only real remedy for unemployment is work, and that "it is an essential duty of the State, whether through local councils or central officials, to find an opportunity of useful labour for all those citizens who are ejected from the labour-market by the working of economic laws over which the individual has no control. Work or maintenance—there is the irreducible minimum which Socialists demand shall be made the legal, as it is now the moral, right of every citizen."

Speaking on March 17th, 1908, to the Association of Municipal Corporations, the Rt. Hon. John Burns said the municipalities spent 140 millions a year, and were the largest employers of labour. It seemed to him that that 140 millions was spent mostly on works of building construction, or engineering. It was mostly spent in the building and kindred trades, which did not suffer from foreign competition; and yet, curiously, were more liable to depression and fluctuation than any other trade. Much of that work was done, in his judgment, when the private trade was busy and when municipal work ought not to be carried out. Without damage to the public interests, without damage to the public health, with no disadvantage to the community, he believed that the local authorities, by better organization, by better distribution and allocation of work, might, if they co-operated with the Imperial authorities, who also spent 140 millions on other work, produce a result which would be of the greatest benefit to all. He asked them seriously to consider that suggestion. If they carried it into effect, he was convinced that they would take one of the most practical and useful steps for mitigating the sufferings of the unemployed that had ever been adopted in our time.

Addressing the House of Commons on the occasion of the Local Government Board Vote on July 29th, the same speaker assured hon. members that "every loan he could facilitate, subject to the rules of good finance and the work being properly carried out, which would throw the work into the winter months, would receive his best efforts and attention. In fact, there was already a standing order that no loan should be kept back, the acceleration of which would give work from November to March that might in other circumstances be done from March to October. He was in communication with surveyors, engineers, railway managers, and the owners of docks so as to get them to do everything in their power to diminish casual labour, to reduce overtime, and to see that the amount of work to be done without overtime should be spread over the largest number of men. . . . The Government had supplemented the Unemployed Act with a grant and other legislative proposals. . . . They had arranged that the report as to coast erosion and afforestation should be published concurrently with the report of the Poor Law Commission. Apart from administration, however, the Government had done their best by small holdings, housing, and child legislation, and old age pensions to do their duty to the unemployed. He was convinced the House was satisfied with the administration of the Government and that it would pass the Estimates of his Department. Their administration of the Unemployed Act had been accompanied with sympathy and with reasonable moral courage."

Trade Union Congress, 1908

The unemployed question was dealt with on September 10th, 1908, at the Trade Union Congress at Nottingham, and was the occasion of some significant speeches. The fact that the question threatens to be a particularly serious one in many places during the coming winter, and that relief measures have already been decided on in Glasgow, Nottingham, Liverpool, and Sheffield, gave a very real interest to the debate.

Mr. J. Walker (Workington Steel Smelters) moved a resolution to the effect that the Unemployed Workmen Act had failed; that unemployment was now permanent even in busy seasons; that the Government must make provision for finding work of public utility for all sections of the unemployed; and that the Parliamentary Committee should heartily support Mr. P. Wilson's Unemployed Bill.

Mr. Pete Curran, M.P., said the industrial world was face to face with one of the most pathetic sights that had ever been experienced during the industrial history of this country. "We have trade in its normal state," he went on, "and at the same time, in the month of September, we have hundreds, nay, thousands, of men all over the country clamouring at the doors of municipal buildings and demanding that the local authorities shall do something to find them employment. If that state of affairs exists in September, what may we expect during December and January?

"If the Government is not prepared to do something there is a probability that owing to the indifference of the Government thousands of hungry men, anxious and willing to work, may attempt to do something for themselves. If anything of that character occurs we in the House cannot be blamed."

Mr. Will Thorne, M.P., said the resolution did not say a single word about the cause of unemployment. The reasons were the speeding-up of machinery and the introduction of new inventions. One of the best palliatives was a reduction of hours in all trades. Eventually, he said, the workers will have to tackle the question of machinery—not to destroy it, but to capture it, and have it worked and controlled for the benefit of the whole community. The Board of Trade returns showed that eight per cent. of skilled men were out of work. He had made careful estimates, which convinced him that for every artisan out of work there were at least three labourers unemployed.

Mr. Ben Turner (Batley Weavers) said the horrors of unemployment were best realized by those who had gone through them. The returns showed that ninety-five per cent. of the men who enlisted in the Army did so not because of their love for the flag, but because they were hungry and wanted work which would bring them bread. The Salvation Army returns showed that the chief cause of suicide was unemployment, and other figures showed that last year 2432 people became insane either owing to actual unemployment or the fear of it.

The resolution was submitted and adopted unanimously.

Mr. Bowerman, M.P., moved a resolution that the Government should consider the propriety of making grants in aid to trade organizations which, during periods of slackness, support their members by the payment of out-of-work benefit, and that Ministers should receive a deputation on the subject.

Eventually, on a card vote, the resolution was carried by 921,000 to 559,000.

Some approximation of the unemployed may be gathered from the monthly returns to the Labour Department of 273 principal trade unions, whose membership during 1907 increased from about 616,000 to 635,000. Upon these returns are based the published percentages of unemployed and the "employment charts" of the Labour Department. For the past ten complete years the mean annual percentages of unemployed have been—

	1897.	1898.	1899.	1900.	1901.	1902.	1903.	1904.	1905.	1906.	Ten years' mean.
Percentage	3·4	3·0	2·4	2·9	3·8	4·4	5·1	6·5	5·4	4·1	4·1

At September, 1907, 28,914 out of a total membership of 631,241 were out of work.

The monthly percentages of unemployed, 1906 and 1907 compared, reveal—

	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Nine months' mean.
1906	4·7	4·4	3·9	3·7	3·6	3·7	3·6	3·8	3·8	3·91
1907	4·2	3·9	3·6	3·3	3·4	3·6	3·7	4·0	4·6	3·81

It is calculated that the unskilled workers out of employment are two and a half times more than the skilled men dealt with in the above tables.

Government Returns

A return was issued by the Local Government Board on August 14th, 1908, of the work of the 117 distress committees' operations under the 1905 Act, for the twelve months ending March 31st, 1908, and of the Central (Unemployed) Body for London during the same period.

According to Board of Trade figures published on October 16th, 1908, 251 Trade Unions reported that at September 30th, 1908, out of a total membership of 593,000, there were no less than 55,793 out of employment, representing 9·4 per cent. of the above total.

The number of applications received to March 31st last, and entertained, was as follows:—

	Applications.	Entertained. Applicants.	Dependents.
London Committees	32,624	14,291	42,765
Provincial ,,	57,433	40,322	108,206
	90,057	54,613	150,971

The total of applicants was six per thousand of the population. The highest proportions in London are found in Bermondsey, Poplar, and Woolwich, in each of which the applicants were over twelve per thousand of the population, the average proportion for London being 6·9 per thousand. Outside London, the numbers in Sunderland, Edmonton, Erith, Tottenham, West Ham, Brighton, Norwich, East Ham, Barrow-in-Furness, Hastings, Reading, and South Shields were in excess of this figure, the average proportion for all districts outside London being 5·7 per thousand of the population. For the ten districts bordering on London, viz. Croydon, West Ham, East Ham, and Hornsey, and the urban districts of Edmonton, Erith, Leyton, Tottenham, Walthamstow, and Willesden, the number was 15,832, or 12·2 per thousand of the population.

Of the total number, 3032 were women. The total number of men who applied to distress committees in the year represented 2·1 per cent. of the working male population, as compared with a proportion of 1·9 per cent. in 1906–7, and of 2·4 per cent. in 1905–6.

London Figures

The increase has occurred chiefly in London, where the number of applications in the past year (32,624) was 4443 in excess of the previous year. The difference between the two years was over fifty per cent. in Poplar, and most of the boroughs show some increase. Outside London, on the other hand, many districts had fewer applicants. The most marked increase occurred in Sunderland, owing partly to depression in the shipbuilding trade and partly to industrial disputes. The building trade remained, according to the general account, in a depressed condition, and the engineering and kindred trades became affected. The shipping trade was also reported as being depressed. General labour was affected by the adverse conditions prevailing in the building trade and in the skilled industries.

In as many as 30,257 cases, or about one-third of the whole, the applicants had applied to a distress committee on a former occasion. Of the 90,057 applications

received, some 77,462 cases, or eighty-six per cent., were investigated. In 22,849 the applications were rejected or not proceeded with—3384 on account of unsatisfactory character; 4900 on account of receipt of poor relief within the preceding year; 3350 on account of assistance on relief works in two successive preceding years; and the remainder owing to removal from the district or the fact of the applicants having found work. Of the whole number of applicants, 54,613, or 66·6 per cent., were qualified for assistance under the Act. Nearly eighty per cent. were between twenty and fifty years of age, the largest group being between thirty and forty.

A classification according to occupation shows that 53·3 per cent. were general or casual labourers, 19·4 per cent. in the building trade, and 8·6 per cent. in the engineering, shipping, and metal trades.

Employment, either on relief work or on ordinary work, was offered to 41,459 persons, including 9167 in London. Of these, 5469 had already found work, or for various reasons did not take the work offered. Of distress committees outside London thirty-four reported that no work had been provided through them, but in several cases work was found with private employers.

In London employment was provided principally by the Central (Unemployed) Body, and men were, as in the previous year, selected by the distress committees from their registers to take up the work provided for them as opportunity occurred. The average number of men at work on one day in the winter on all the works thus provided by the Central Body was: On farm and labour colony works, 321; on work in public and other parks, etc., 1610. The usual rate of pay on works other than farm colony works was 6*d.* per hour, and the period of employment ranged from $1\frac{3}{4}$ weeks to $9\frac{1}{2}$ weeks. In addition, the Central (Unemployed) Body provided during the year workrooms for women in three districts—Camberwell, Poplar, and St. Pancras. The average number of women employed on one day in this manner was 104. The women had on an average from 12 to $13\frac{1}{2}$ weeks' work, and received payments at rates ranging from 10*s.* to 17*s.* 6*d.* per week, according to the number of dependent children.

The rate of pay in provincial districts was very commonly 5*d.* per hour. In London the average rate was 6*d.* per hour. The total amount earned in wages by the men and women employed on the various works provided by the Central Body, distress committees, and local authorities was £124,387, of which approximately £15,500 was paid to men and their families engaged on labour colonies.

On October 20th, the London County Council allocated £7800, out of funds received from the Local Government Board, to the Central (Unemployed) Body, arranged for extensive works in parks and open spaces, and passed estimates involving work on tramways to the amount of £281,265. In Parliament the Rt. Hon. H. H. Asquith stated, on October 21st, that the Government had increased the grant to the Central Fund under the Unemployed Act to £300,000, and had expedited £2,500,000 worth of works and contracts ordinarily considered much later. On October 26th, an animated debate took place in the House on the Unemployed question.

A few committees outside London, Southampton and Leicester especially, used their powers to rent land for work of cultivation. The London local labour exchanges registered during the year 116,034 persons, including 20,339 women. This was rather more than double the number of the previous year. The industrial quality of the workpeople using the exchanges during the year was reported to have improved. The number of situations filled through the agency of the exchanges during the year was 22,096, including 5340 situations for women. The cost of the employment exchanges in London amounted for the year to £8600.

Labour Exchange Registrations

The number of persons assisted to emigrate during the year was 6066, viz. 1321 men, with 3076 dependents, from London; and 437 men, with 1232 dependents, by committees outside London. The total cost of the emigration during the year amounted, in the case of London, to £30,996, and in the provinces to £11,784. 776 persons, including 557 dependents, were assisted to remove to other areas, including 508 persons from London.

The financial statement shows that £186,350 was received by London, and £91,108 by the provincial committees. Of this total of £277,458, £112,581 came from rates, £127,671 from Parliamentary grant, £11,354 repayments for work done, and £7833 from voluntary contributions. The expenditure was £225,687, including £38,392 for cost of work on farm and labour colonies, and £97,124 otherwise; £16,450 for cost of exchanges, etc., and £48,931 for emigration or removal.

UNITED KINGDOM ALLIANCE: Founded in 1853. Object: A general temperance propaganda, looking to the ultimate prohibition of the drink traffic by legislative enactment. Special work was done by the Alliance in connection with the Licensing Bill of 1908. Official organ, *The Alliance News and Temperance Reformer*, weekly, 1*d.* President, Mr. Leif Jones, M.P. *Secretary:* Mr. W. Williams, Broad Sanctuary Chambers, 20, Tothill Street, Westminster, London, S.W.

UNITED PATTERNMAKERS' ASSOCIATION: Founded in 1872. Membership, 6962. President, Mr. Arthur Pearson. *Secretary:* Mr. Wm. Mosses, 32, Street Lane, Leeds.

UNIVERSITY EXTENSION GUILD (LONDON): Founded in 1903. Membership, about five hundred. All residents in London interested in general higher education are eligible. Objects: To foster and strengthen the University Extension movement, by holding meetings of representatives of the centres for discussion of questions of general interest to University Extension workers, by affording information as to facilities for general higher education provided by the University Extension system to visitors from the British Colonies and Dependencies as well as from other countries, by arranging supplementary lectures, social gatherings, etc. President, Sir William Martin Conway. *Hon. Secretaries:* Mr. Ernest H. Short and Mr. Alfred P. Griffiths, 449, Birkbeck Bank Chambers, London, W.C.

UNIVERSITY EXTENSION, OXFORD: Work was established in 1878, but did not begin regularly till 1885. The lecturers on the staff number about sixty, and the audiences vary in number from thirty or forty in small country towns to one thousand in large industrial centres, the average being 150. A travelling library, containing from thirty to fifty volumes bearing on the subject of the lectures, is sent from Oxford in connection with each course. Examinations on the subjects of the courses (History, Literature, Art, and Natural Science) are held, and certificates awarded. Centres exist in nearly two hundred towns, and over 22,000 students are in regular attendance. A "Summer Meeting" is held biennially at Oxford, and is attended by over one thousand University Extension and other students, of whom nearly one-third come from abroad. *Secretary:* Mr. J. A. R. Marriott, M.A., University Extension Delegacy, Oxford.

V

VAGRANTS: (See under POOR LAWS.)

VALUE OF LAND IN THE UNITED KINGDOM: (See under LAND VALUES.)

VANDERVELDE, EMILE: Leader of the Labour Party in the Belgian Chamber; born in 1868. He is amongst the most learned of living Socialists. His recent publications upon agriculture in its relation to social reform include *L'Exode Rural et le Retour aux Champs* (Paris, 1903), *Essais sur la Question Agraire en Belgique* (Paris, 1903), *Collectivism* v. *Industrial Evolution*, etc. *Address:* Palais de la Nation, Rue de la Loi, Brussels.

VEGETARIAN SOCIETY AND ASSOCIATION, LONDON: Founded in 1883. Official organs, *The Vegetarian*, monthly, 1*d.*; *The Children's Realm*, monthly, ½*d.* Over 800,000 meals have been supplied to the poorest children in London under the Children's Dinner Fund. President, Mr. A. F. Hills, M.A., D.L. *Secretary:* Miss F. I. Nicholson, Memorial Hall, Farringdon Street, London, E.C.

VIGILANCE ASSOCIATION, NATIONAL: Founded in 1885, and incorporating the Minor's Protection Committee, the Society for the Suppression of Vice, the Belgian Traffic Committee, and the Central Vigilance Society. Object: The repression of criminal vice and public immorality, and the suppression of the "white slave" traffic. For the fiscal year ending April 30th, 1908, 1250 inquiries were made for young women as to the genuine character of those who were seeking their services; international cases dealt with were 2595, and repatriation cases, eight. The Association has branches in Manchester, Cardiff, Sunderland, and Hull and the East Riding. President, The Earl of Aberdeen. *Secretary:* Mr. William Alex. Coote, 161a, Strand, London, W.C.

VIVISECTION: The practice of vivisection has been extant since the time when Galen and the Alexandrian School practised it. In the nineteenth century, however, attention was called to the alleged needlessly cruel and frequent experiments conducted by vivisectionists, and in 1876 a Royal Commission sat, out of which evolved a Bill in 1876 for the better regulation of vivisection. Much has been done between that time and this. Anti-vivisection societies have sprung up, and a further Royal Commission which began its sitting in October, 1906, issued its report in the spring of 1908. Based on the evidence, a Bill has been drafted "To Prohibit Experiments upon Animals," and this may be expected to engage the attention of Parliament very shortly. The practice of vivisection has enormously increased during recent years. In 1881 there were 270 experiments, and in 1906, 46,073; and at date of writing they approximate fifty thousand. These figures apply only to England, Wales, and Scotland.

Among medical authorities who question the value of vivisection are Sir Frederick Treves, Sir Wm. Fergusson, and Prof. Lawson Tait. The case against vivisection may be summed up in the argument that it does not advance knowledge of human physiology, and is therefore a needless cruelty.

On the other hand, the majority of the medical profession argue that it is highly educative as to the internal functions and organs of the body, the course and condition of the blood, and the possibility of tracing the progress of a disease in the body of an inoculated animal. Sir Douglas Powell, President of the Royal College of Physicians; Lord Rayleigh, President of the Royal Society; and Frederick Taylor, M.D., Consulting Physician to Guy's Hospital, London, favour vivisection. (See ANTI-VIVISECTION SOCIETIES.)

VIVISECTION, BRITISH UNION FOR ABOLITION OF: Founded in 1898 by Frances Power Cobbe. Official organ, *The Abolitionist*, monthly, 2*d.* Vice-President, H.S.H. Princess Ludwig von Löwenstein-Wertheim. *Hon. Secretary:* Dr. Walter R. Hadwen, 32, Charing Cross, London, S.W.

VIVISECTION, THE INCORPORATED PARLIAMENTARY ASSOCIATION FOR ABOLITION OF: Founded in 1902. The Royal Commission on Vivisection was appointed in accordance with a request from one of the vice-presidents, and the Association led the way in giving evidence for the anti-vivisection party. The list of vice-presidents shows sixteen Peers and eighty-eight members of Parliament as supporters of the anti-vivisection Parliamentary movement. *Hon. Secretary:* Sir George Kekewich, K.C.B., M.P., Parliament Mansions, Victoria Street, London, S.W.

W

WAGE-EARNING CHILDREN, COMMITTEE ON: Founded in 1900. The Committee has agitated for the further regulation of child labour, the establishment of children's courts, and the appointment of special magistrates and probation officers for children. President, Mr. Stephen N. Fox. *Hon. Secretary:* Miss Nettie Adler, 6, Craven Hill, Hyde Park, London, W.

WAGES BOARDS: The establishment of legal wages boards in England is one of the leading features of the Sweated Industries Bill, which passed its second reading and was referred to a Select Committee on Home Work on February 21st, 1908. However, the Rt. Hon. H. J. Gladstone, in speaking on the Bill, said that the House were not to consider the proposal as committing the Government to the principle of a compulsory minimum wage. Until the report of the Select Committee and also that of the Commissioner sent to Australia to inquire into the conditions there had been received, the Government purposed to reserve judgment on that particular question as a whole.

The Bill provides that "Wages boards shall be established throughout the United Kingdom, for tailoring, dressmaking, and the making, altering, trimming, finishing, and repairing of shirts. And a wages board shall have power to make regulations fixing the minimum rate of wages to be paid to persons employed in the district such board is formed to control."

Sir Charles Dilke introduced the first Wages Boards Bill in 1900, and in 1906 another. In 1907 a Bill to establish Wages Boards was presented, which had the support of Sir Charles Dilke, Messrs. Percy Alden, Chiozza-Money, G. N. Barnes, A. Henderson, and D. J. Shackleton, among other members. It was read for the first time on February 15th, 1907.

Speaking in October, 1907, in Glasgow, at a Conference on Sweated Industries, Mr. Edward Carpenter discussed the matter from an employer's point of view and also that of the public—

"There is evidently a growing public opinion in favour of the constitution of wages boards and the establishment of some kind of legal minimum; and doubtless something will be done in that direction.

"It is generally tacitly assumed that a legal minimum, by raising wages in low classes of labour, will handicap the employer, make the realizing of a profit more difficult, and generally place a strain upon him. I want to point out that in many respects this is the reverse of what will happen. And I believe that quite a few employers are beginning to realize that this is so, and therefore are favourable to a legal enactment—though no doubt the majority still are opposed to it.

"The case in reality is very simple. Every one knows that the employer to-day has a most anxious time. The dread of competition, the continual fluctuations of prices, the fear of being undersold in the market, haunt him. At any moment a competitor may undersell him; and one of the commonest causes of such underselling is the employment of cheap labour.

"Now, we must contend that to rule out or prevent this operation by fixing a minimum below which the wage shall not go, is a benefit, not only to the employed, but to the employers themselves. It gives them at last some firm ground beneath their feet. It takes away one large cause of doubt and risk and uncertainty; and simplifies greatly for them the problem which they are handling.

"By the fixation of a minimum wage the financial ground beneath their feet will have been made comparatively solid, and the conditions so far equal for all.

Wage Minimum

"The truth is that, within limits, it does not matter to an employer if wages are high, provided all other employers have to pay equally high. It may matter to the public, of course (who may have to pay a higher price for the article), but not to the employer. We come, therefore, now to the question of the interest of the public.

"That the absence of a minimum wage (whether that minimum be obtained by trade unions or by wages boards) may mean a cheapening of price to the public, must of course be admitted. But I think no one will say that that in itself constitutes a sufficient reason. And in the case of the so-called sweated industries, there are reasons for supposing that the enhancement in price due to the minimum regulation would be almost imperceptible, as the wages often bear such a very small ratio to cost of materials, profits, salaries of superintendence, etc., that a rise of wages need make but little difference in the price of the article."

Mr. Ramsay Macdonald, speaking before the Women's Industrial Council in April, 1908, maintained that wages boards as a political proposition were not workable, and would lead to no important economic change.

In a leading article on the Railway Crisis and Wages Boards, the *New Age*, of December 21st, 1907, looking at the question from the Socialistic standpoint, thus commented—

"We repeat that wages boards are fortunately an experiment outside party dispute; but we repeat that they are an experiment to be watched with extremely jealous care. We may be quite sure that if they afford loopholes for escape from the responsibility of providing a living wage, and not merely a wage favourable to dividends, the railway companies will find that loophole.

"On its isolated merits a wages board may seem a useful enough device for regulating wages without strikes; but progress towards Socialism does not consist merely of getting rid of the necessity of strikes. We can conceive many modes of averting strikes. The mere avoidance of strikes may be extremely comforting to investors, but the method employed must be considered by genuine reformers. Even supposing that wages boards avert strikes—which is more than can be claimed for them—the question still remains: Do wages boards favour the economic revolution demanded by Socialists?

"We therefore beg all advocates of wages boards to reconsider their ground, to look well before they leap with the Liberal Party into a principle which, so far as we can see, is unable to abolish sweating, unable to secure a living wage; and, in addition, diverts the mind of trade unionism from its true political and economic path."

On the other hand, in their book, *Industrial Democracy*, Mr. and Mrs. Sidney Webb, both prominent social reformers, showed that the principle of a minimum wage was "neither theoretically unsound nor practically impossible."

On April 27th, 1908, a conference was held in London at the Society of Arts under the auspices of the Anti-Sweating League, at which M. Fontaine, Directeur du Travail in France, and M. Vandervelde, head of the Socialist Party in Belgium, read papers on "An International Minimum Wage." The papers proved that educated opinion abroad is rapidly being drawn in the direction of regulating wages, both M. Fontaine and M. Vandervelde, from their different points of view and different experience, having been driven to the conclusion that there is no other remedy at present available to check the ravages of industrial exploitation. Many distinguished German Economists, they said, are beginning to think the same. An international minimum wage law appeared impossible for the present, but the European Industrial States would watch with interest the result of the Wages Boards Bill, with the hope of introducing measures on similar lines.

The movement in favour of wages boards in the United Kingdom as a remedy for "sweating" resulted in the appointment, during the summer of 1907, of a Select Committee to inquire into the whole question of "home work," and the possible remedies. Mr. G. R. Askwith, the Board of Trade Arbitrator, told the Select Committee (August 1st, 1907) that there was a growing opinion among the best class of employers in favour of such boards. The report was issued in the autumn of 1908. (See SWEATING.)

Select Committee

Supporters of wages boards are at present divided in opinion between the New Zealand system with its judicial authority, and the Victorian system, more nearly resembling our own trade arbitration boards. Well-known authorities like Miss Clementina Black and Mr. and Mrs. Sidney Webb support the New Zealand system, whilst the Victorian system is supported by the Women's Trade Union League and Anti-Sweating League, and by Sir Charles Dilke, who made it a model for his own Bill of 1906 on Wages Boards, already referred to.

In a *Fabian Tract* (No. 128), dated April, 1908, was outlined the Fabian Society's estimate of the proper basis of a minimum wage law—

"The Act should aim at the fixing and enforcement of a wage sufficient to enable our workers to be maintained in healthy existence. Therefore, the wage should be calculated on what the worker requires for physical health and efficiency, and not on what the trade will bear. The latter method, obviously resulting in the fixing of different minimum rates for each trade, would come under the head of wage regulation, which, in the interests of industrial peace, may be extremely desirable, but is something quite apart from the establishment and enforcement of a national minimum wage in the interests of physical and industrial efficiency. The minimum wage would not replace 'standard' or 'trade union' rates where these were the higher amount.

"In the second place the law must be national: that

is, must apply to the whole country, in order that no district shall undersell another in the labour market at the cost of national vitality. Thirdly, since the last condition cannot be fulfilled by equal money wages all over the country, the Act must be drafted on the assumption that it is possible to determine a national minimum of real wages: that is to say, such a wage as, worked out in its cash equivalent will equalize all local variations in cost of living."

Discussing the benefits that would accrue from such a proposal becoming law, the *Tract* continues—

"What is the number of persons who would immediately feel the effects of the enactment of a legal minimum wage? If we take Mr. Rowntree's figures with regard to the primary poverty in York as fairly representative of the whole kingdom, we should have about five millions of people who are members of families that have incomes insufficient to maintain merely physical efficiency. Many of its members, it is true, would not be capable of earning even the low minimum suggested. These would become the unemployable. To the others, the largest proportion, an increased wage would give the increased mental and physical vitality which are a nation's real capital. There would be a gradual growth in the national dividend, arising from the greater power of production due to the increase of physical efficiency, and the share of each grade and each trade in the dividend would be increased accordingly. A minimum wage law cannot cure the evils which arise from the foolish spending of incomes small or great, but it would act as a palliative of those evils which arise from the existence of incomes that are insufficient for the barest necessaries of life."

Australasia

The Home Office, on July 10th, issued as a Blue Book a report by Mr. Ernest Aves to the Home Secretary on the Wages Boards and Industrial Conciliation and Arbitration Acts of Australia and New Zealand. Mr. Aves was appointed in January, 1907, to inquire into the systems of wages boards established in some of the Australian Colonies, the systems of compulsory arbitration in industrial disputes which have been established in Australia and New Zealand, and the working of the Acts for the regulation of hours of employment in shops. Mr. Aves's conclusions may be briefly summarized as follows:—

"For the most part the advantages claimed by their supporters with varying degrees of validity for special wages boards or for industrial arbitration courts are not peculiar to one system or the other, such as increased wages; improvement in conditions; the maintenance of industrial peace; the increased cohesion of the parties concerned; the ability to contract on an assured wage basis; the suppression of the incompetent employer; and the spread of a greater spirit of contentment. Similar claims might be and indeed are advanced on behalf of other systems resting on a voluntary basis, such as those secured by conciliation boards in England or by the adoption of the co-operative principle.

"As regards the particular methods of industrial settlement that have been examined, although the interest of the general public cannot be entirely severed from that of any trade or industry carried on in its midst, the point of view varies. It is obvious, for instance, that the public interest and the public concern differ in kind as to whether the railway or post-office service or, if there be a local monopoly, coal mining are affected; or, again, as representative of a second great group, the engineering or carriage industries; or of a third group, the lowest paid branches of shirt makers or cardboard box makers.

"In connection with the two first industrial groups to which allusion has been made, it has been assumed that customs are observed and wages paid which are at least compatible with the maintenance of some accepted minimum standard of living. There remains, as has been suggested, a third group of trades in which, or more often in parts of which, this standard is not maintained. They are in whole or in part the under-rate trades.

"The experience of Victoria, valuable and interesting though it is, is thus not conclusive, if only because too brief, too simple, and too exclusively connected with an era of prosperous trade. The problem, highly contentious even there, has differed from that presented in this country very fundamentally—in intensity, in scope, and in circumstance.

"The boards have helped both in the home and in the factory, and probably not simply in the trades under them, to set a more certain standard. They are also believed to mark out a point below which, should reaction come, wages will not, at least without greater difficulty, fall. The test of this period of decline has, it is true, not been reached, and should it come the determinations may break down. But while maintained, or sometimes even when exceeded, they are felt to be a source of strength. They affect sentiment—both public and private. They help to establish beneficial customs, and if character is not thereby weakened this is a great gain. They become, moreover, something which the conscience, not only of the trade, but also of the community, has to take into account.

"There seem to be at once great scope and need for the influence of fuller knowledge of the wider publicity of conditions held to be to the common welfare, and of appeal to sentiment and to sympathy, the whole to be combined with power to impose the pressure of more exacting restrictions or obligations, in proven cases of gross dereliction of social and industrial responsibilities But the lesson of experience does not appear to carry us further than this on the direct line of the legal fixation of wages.

"For various reasons, therefore, the evidence does not appear to justify the conclusion that it would be advantageous to make the recommendations of any special boards that may be constituted in this country legally binding, or that if this power were granted it could, with regard to wages, be effectively exercised."

The main features in the arbitration laws of Australia and New Zealand are given on page 61.

WEIGHTS AND MEASURES ASSOCIATION, BRITISH: Founded in 1904. Object: The defence, and, where practicable, the improvement of British weights and measures. The membership is composed of trade federations and others. The weights and measures of various countries are investigated with a view of securing that any reform recommended shall be on progressive and scientific lines. Official organ, *British Weights and Measures*, quarterly, 6*d*. President, Mr. Robert Kaye Gray. *Secretary:* Mr. George Moores, F.S.S., 12, Exchange Street, Manchester.

WELFARE AND PROTECTION OF CHILDREN, INTERNATIONAL CONGRESS FOR THE: Founded in 1888. Object: To hold triennial international congresses in various countries. The membership is about five hundred. The Congress in London in 1902, under the patronage of the King and of Princess Louise, introduced the question of probation officers and of special treatment of child offenders to this country; it also gave a practical turn to the movement for the regulation of street trading by children, and hastened the Government inquiries into vagrancy and the care of the mentally defective, members of the Congress being put on each of the Commissions and Committees. President, Sir William Bousfield. *Secretary:* Mr. William Gibson Lewis, 8, Wells Street, Gray's Inn Road, London, W.C.

WHITE CROSS LEAGUE, THE: Founded as a Church of England Society in 1883. Objects: Purity among men; a chivalrous respect for womanhood;

to preserve the young from contamination; to promote a higher tone of public opinion; to carry on rescue work, primarily among men, but also to support rescue work among women. Official organ, *The White Cross*, monthly, 1*d*. Presidents, The Archbishops of Canterbury and York. *Hon. Secretaries:* Rev. A. S. C. Harrison, M.A.; Col. R. Wynyard, M.V.O., 7, Dean's Yard, Westminster, London, S.W.

WOMAN WORKER, THE: The economic position of the woman worker is receiving increasing consideration from sociologists and Parliamentarians, it being upheld in many quarters that the disparity in the wage-earning capacity of men and women is not warranted by the difference in the quality and nature of their work. Indeed, it is contended that, in some branches of skilled and Government labour, the work is actually performed at least as efficiently by the small-waged woman as by the higher-salaried man.

In comparing generally the rates of wages earned by women in skilled trades with those earned by men an immense difference is apparent—that a woman's maximum is a man's minimum, or that a woman's skilled labour is remunerated at about the same rate as a man's unskilled labour. With very few exceptions this is true. It has been pointed out that men and women are so rarely employed on absolutely identical work that comparison of their earnings is difficult. But making all allowance for this, there still remains a glaring difference in the rates of remuneration.

Mr. Sidney Webb sums up the causes which operate to produce this state of things as—(1) the influence of custom and public opinion; (2) the lower standard of life of women as compared with men; (3) woman's lower productivity in the quantity or quality of her work; (4) woman's lack of protective power, owing to her weakness in combination into Unions.

An article in the *Westminster Review* for December, 1907, dogmatizes thus:—

"We shall find that the true explanation of the exploitation of the woman worker lies in the existence of the double-sex standard, which we have allowed to grow up in our minds, and which prevents us from either thinking or acting fairly and justly towards women. By a double-sex standard is meant here simply this: that where men are concerned, abilities and capacities, and consequently work, are, generally speaking, judged according to merit, but in the case of women, these are considered to be depreciated by the mere fact of sex alone. Hence, a woman's work is not placed upon the same level as that of a man, not primarily on account of any relative intrinsic inferiority, but solely and simply because she is a woman, and for this reason alone she is expected, and unfortunately herself expects, to have her work remunerated accordingly.

Double-Sex Standard

"Now, however much we may try to bring about reforms by legislation in the passing of regulative and restrictive measures, no real lasting remedy will be found so long as the mental attitude of the people remains unchanged; and one important point is continually being overlooked by our would-be reformers, that every attempt to impose restrictive legislation, which is based upon the sex of the worker, not upon the worker irrespective of sex, merely helps to bolster up in our minds this double-sex idea in relation to women and to women's work."

There are some 3¼ millions of unmarried women who work for their living in England, and nearly a million of married women.

The census taken in 1901 showed a remarkable decrease in the proportion of occupied women and girls; 31·6 per cent. of all females over ten years of age were returned as occupied, as compared with 34·4 per cent. in 1891. In 1891 there had been a very slight increase as compared with 1881. Of the total number of occupied women and girls the highest proportion are returned as occupied between fifteen and twenty years of age; among the married and widowed the highest proportion is between fifty-five and sixty-five years, and among the unmarried between twenty and twenty-five years. Although there has been an increase in the proportion occupied at the ages of fifteen to twenty-five years, there has been a decrease at every age-group above twenty-five years. There appears, therefore, to have been of late years a substitution of younger for older women.

Of all occupied women and girls about 40½ per cent. were employed in domestic and other service. The clothing trades (dressmaking, millinery, tailoring, etc.) occupied less than half that number, accounting for 16½ per cent. The textile industries employed fourteen per cent., rather less than the clothing trades. These three great divisions together accounted for seventy-one per cent. of all occupied women and girls.

The status of women workers divides naturally into two broad planes—skilled and unskilled labour, and these again must be subdivided to arrive at any comprehensive survey of the subject.

Among the various trades in which skilled workers are needed a wide range of wages exists, and even in any particular branch, local usage, competition, and other circumstances admit of much fluctuation. An all-round average, however, based on Board of Trade returns, gives the following:—

Skilled Workers

Tailoring, dressmaking, and millinery—
- Apprentices, 2*s*. 6*d*. to 5*s*. per week as "pocket money."
- Improvers, 7*s*. 6*d*. to 10*s*. per week.
- Bodice, skirt or sleeve hands, 15*s*. to 25*s*. per week.
- Cutters and fitters, best hands and forewomen (West End), £3 to £5 per week.
- Head milliners (West End), £2 to £3 per week.
- After four or five years an average girl will earn 15*s*. to 18*s*., and a clever girl 20*s*. to 25*s*. per week.

Corset makers, in the bespoke houses—
- Apprentices, 2*s*. 6*d*. a week (but some firms pay nothing).
- Competent hands, 15*s*. to 20*s*. per week.
- Cutters, 30*s*. to £2.
- The ordinary shop corset is usually made by unskilled labour.

Cotton trades—
- Range, taking all districts, £1 to 12*s*. per week.
- (Average in Lancashire and Cheshire 15*s*. 6*d*. per week.)

Woollen manufacture—
- Average, 13*s*. 2*d*. per week.

Worsted and stuff—
- Average, 11*s*. 5*d*. per week.

Upholstery—
- Apprentices, 3*s*. to 12*s*. per week.
- Machinists, 18*s*. to 20*s*. per week.
- Forewomen, 30*s*. per week.

Trade unionism among skilled women workers is growing. In September, 1908, at the Trade Union Conference held at Nottingham, Miss MacArthur stated that the Women's Trade Union League, of which she is Secretary, had affiliated to it upwards of 150,000 working women. Of the total number of women trade unionists in all industries, ninety per cent. are to be found in the textile trades, sixty per cent. of these being in the cotton weaving.

Mrs. Margrieta Beer avers that there is reason to believe that the number of children who enter a skilled trade on leaving school is steadily decreasing. In big towns, she contends, it is fatally easy for a child to enter an unskilled employment in which the initial wages are high, but which offers no prospects for the future.

In order to remedy this state of things the London

County Council has founded several trade schools for girls, where an actual trade training is given, which is intended to replace apprenticeships. The system has been working for some years on the Continent with very successful results. In these schools beside the trade training, general education is continued, and the artistic training which educates the eye and taste of the worker is not neglected. Dressmaking, ladies' tailoring, upholstery, waistcoat making, corset making, and laundry work are the trades taught in these schools.

In another sphere of skilled work may be enumerated Post Office and other Government officials, teachers, etc.

Post Office

According to Miss Mabel Hope, of the Postal Telegraph Clerks' Association, "the last fifty years has seen a remarkable growth in the number of women employed in official work. In 1861 only 0·5 women were employed as commercial clerks to every one hundred men. In 1891 it was eight to sixteen times that number, and the proportion is increasing every year, until at present (1908) there are nearly 33,000 women employed by the Post Office, being about one-fifth of the total staff.

"In 1871 (immediately after the State acquisition of the telegraphs) women were, generally speaking, confined to one Department—the Telegraph—numbering 972 in all. Since that year, however, the increase has been most rapid, the figures for the established staff of the Civil Service at the end of 1907 standing at: Women clerks, London, Dublin, and Edinburgh, 1770; Female telegraphists, London, 1900; Provinces, 5000. Female telephonists, London, 600; Provinces, 1330. Women sorters, London, 668. Government typists, London, 215."

As to the character of woman's work in this sphere, the Committee of Expert Post Office Officials reported some time since: "Testimony has been very generally given in favour of work done by the women. At all the ordinary duties of a telegraph office they are as useful as men, and the Department would gain financially and not lose in efficiency if the employment of women were considerably extended."

Notwithstanding the recognition of efficiency, the wages rule twenty-five per cent. less than men's. The mean wages increase to women during the period 1872 to 1897 was thirty-nine per cent. in London, and twenty-one per cent. in the provinces. Since 1897, although the cost of living has risen considerably, wages have been almost stationary. The report of the Select Committee on Post Office Servants issued in July, 1907, recommended among other things an appreciable increase in the average wage. A comparison is appended:—

Old and New Scales.*

	Women clerks.	Telegraphists.	Telephonists.	Sorters.	Government typists.
Old	£55 to £100 yearly	£46 16s. to £98 yearly	£44 4s. to £67 12s. yearly	£44 4s. to £78 yearly	£46 16s. to £65 yearly
Committee's scale.	£65 to £110 yearly	£52 to £104 yearly	£46 16s. to £72 16s. yearly	(increased yearly increment but no higher maximum)	(not included in scope of inquiry)

The teaching profession offers a vast field for the woman worker, not only in the Elementary Schools, but also in Secondary Schools. In the latter,

The Teaching Profession

remuneration is generally considered inadequate in view of the expense of the necessary education involved before teaching efficiency is attained. After her school life, which extends to eighteen or nineteen years of age, the parents of a girl who proceeds to Cambridge or Oxford without having obtained a scholarship must be willing to expend a sum of not less than £300 to £450 for the cost of a three years' course of study at either of these universities, and an additional £80 or £90 at least for one year's professional training at a Training College for Secondary Teachers. At the end of her college days, a young graduate of twenty-two or twenty-three, who has obtained a first class in a Tripos or Final Honours Examination, cannot usually command more than £100 to £110 as an initial salary, and, unless she should become a head mistress later on, will probably never have a salary of more than £200, and very possibly of never more than £150.

Two other great sections of women's work, which come within the category of skilled work, are general office employment and domestic service. With regard to the former, there is no fixed standard of remuneration. A typist and stenographer will earn from 15s. to 25s. per week, or perhaps 30s. if expert. A case in the Courts in September revealed a woman cashier receiving 8s. per week, and that after some years' service. Remunerated household work—domestic service—is not sought after with eagerness; the demand is greater than the supply owing to restrictions and other deterrent factors.

H.I.M. the German Empress, writing on the servant question, says: "To my mind the unsatisfactory condition of our servants is due to the fact that their mistresses fail to take sufficient interest in their welfare. The chief complaint of domestic servants is that they have too many hours of work and too little personal freedom. But if we were to allow them more freedom, we might expose them to serious temptation. We should, therefore, do all in our power to make our servants' leisure hours as attractive as possible within doors, particularly by giving them nice, cheerful bedrooms, which, I fear, is often far from being the case. I sincerely hope that architects will bear this in mind when designing houses. Besides, we ought, in various parts of the town, to establish homes for servants, where they can meet of an evening, and more particularly on Sunday afternoons, in order to discuss subjects of common interest, and, if possible, receive instruction in their domestic duties. But the chief question with regard to our female servants is their moral character, for who can exercise greater influence on our young children than servants who are daily in their company?"

Domestic Service

The position of the unskilled woman worker has become to be considered synonymous with sweating. Indeed, to quote a recent writer, "the mass of the sweated workers in the country are women." The question of sweating is dealt with in separate articles, and, therefore, the plans and projects extant for improving the condition of underpaid workers will be detailed with more appropriateness in that section. A few examples will be found on page 1181 of the microscopic earnings of these unhappy workers, and details could be added showing the extent and variety of the occupations into which sweating enters. In October, 1907, Miss Irwin, Secretary of the Scottish Council for Women's Trades, instanced shirtmakers, whose remuneration for making the garments throughout except buttonholing averages eightpence per dozen for flannelette, and 1s. 9d. per dozen for cotton shirts, a dozen taking twenty-one hours to make. The thread is supplied by the worker, and this costs twopence per dozen shirts. For boys' shirts the price averages 5½d. per dozen (seven hours' work). There is often also sewing-machine hire to be paid for. A significant sentence in Miss Irwin's report reads: "This family occupy two rooms, both very dirty and almost destitute of furniture. In this case, as in many others, the shirts on which the mother was engaged would, it is absolutely certain, be used as bedding for the

Unskilled Labour

* The above minimum scales are approximately obtainable at nineteen years of age.

family at night, and thus lend themselves as a medium for the dissemination of dirt, disease, and vermin amongst the purchasing public."

As indicated earlier in this article, shop-sold corsets are produced by unskilled labour. Mr. Chiozza Money, speaking at the Co-operative Congress, held at the Crystal Palace, London, in August, 1908, gave as an average remuneration: Making two dozen pairs of corsets at 1*s.* 7½*d.* a dozen, 3*s.* 3*d.* Deductions—(*a*) 1½ lb. of cane, at 8*d.*, 1*s.*; (*b*) two reels cotton, 6*d.*, 1*s.* 6*d.* Balance earned, 1*s.* 9*d.*, and this meant three days' work.

One of the largest box-making firms in the country, according to Miss Mary MacArthur, proposed to reduce, in the autumn of 1908, their piece-work rates in one department from 1*s.* 6*d.* per thousand to 1*s.*; in the cutting department from 1*s.* 3*d.* to 9*d.*; and in the glueing from 1*s.* 1*d.* to 4*d.* per thousand. The latter rate meant that the girls in that section could not earn more than 4*s.* a week, as against 11*s.* 11*d.* at the old rate.

Among groups of home workers excessively low wages are found to exist. Shirt finishers receive as little as 1*d.* to 1¾*d.* per hour. Pinafore making ranges from 10*d.* to 1*s.* 8*d.* per dozen, blouse making, 2*s.* 6*d.* to 3*s.* 6*d.* per dozen. In handkerchief hemming, umbrella-tab sewing, etc., still lower wages are obtained, whilst in match-box making, artificial flower making, conditions are as bad. The unskilled woman worker in factories is often, too, as poorly paid as the home workers referred to. Miss Gertrude M. Tuckwell told the Pan-Anglican Congress in London, in June, 1908: "The average pay of women has been stated, and I think fairly, at somewhere between 7*s.* and 8*s.* Rising in the great textile trades of the North to an average of over 15*s.*, it descends in the case of some home workers to precarious earnings of 3*s.* and 4*s.*"

In the course of the same address, Miss Tuckwell summarized the position thus: "The problem which confronts us is how to regulate the chaos of such inferior labour conditions as I have described; how to put the sweated worker in a position to bargain with his employer for a living wage. This cannot be reached as yet by the voluntary combination of a trade union; the sweated worker has sunk too low in the scale for that. The foresight which makes it possible to see beyond the day's struggle and the capacity for corporate action are gone; to demand a contribution to trade union funds from miserable earnings is to ask too great a sacrifice.

Regulating the Chaos

"The precedent for dealing with such a situation has been established by every law for the protection of the worker, from the old times when rulers considered it their business to obtain for the worker 'a convenient' wage, down to the Factory Law which, with its elaborate provisions for guarding children, young persons, and women, is a perpetual affirmation of the principle that the defence of its weaker citizens is the duty of the State. That regulation of wages which the great unions secure for themselves must be secured by law for those too weak to bargain."

A national aspect of one of the results of the exploitation of the woman worker was thus referred to by Mrs. George Cadbury at Manchester: "We need not look far for one cause of physical deterioration when we realize that all over the country children are growing up who are chronically underfed and insufficiently clothed, owing to the fact that their mothers are giving all their time and strength in return for starvation wages."

WOMEN AND CHILDREN, THE ASSOCIATED SOCIETIES FOR THE PROTECTION OF: An amalgamation of the Associate Institution for Improving and Enforcing the Laws for the Protection of Women, and the Society for the Protection of Women and Children, founded in the years 1844 and 1857 respectively. Amalgamated in 1892. Objects: To protect women and children in cases of neglect and other wrongs, by affording them advice or legal assistance; to strive for the improvement of the statute laws with a view to the more effectual protection of women and children. Patron, H.R.H. Princess Louise, Duchess of Argyll. *Secretary:* Mr. Arthur L. McIlwaine, Albion Chambers, 60, Haymarket, London, S.W.

WOMEN, CENTRAL BUREAU FOR THE EMPLOYMENT OF: Founded in 1898. Objects: To guide educated women in the choice of work; to promote the training of the unskilled; to maintain records of women desiring work, and of employers desiring workers; to collect, investigate, and circulate information as to employment. Official organ, *Women's Employment.* President, Countess of Bective. *Secretary:* Miss Mary G. Spencer, 9, Southampton Street, Holborn, London, W.C.

WOMEN'S CO-OPERATIVE GUILD: Founded in 1883 as a self-governing organization of working women connected with industrial co-operative societies. It has 502 branches, and 25,500 members. Special reforms which it advocates inside the Co-operative Movement include extension of co-operation to the very poor, minimum wage for women employees, Co-operative Health Departments, the representation of women on all boards and committees in the movement. *General Secretary:* Miss Llewelyn Davies, c/o Co-operative Union, 2, Nicholas Croft, High Street, Manchester.

WOMEN'S FREEDOM LEAGUE: A militant Suffrage Society, organized on a democratic basis. There are sixteen London branches, twelve Scottish, twelve provincial, and one Irish branch. The special work done includes a woman's suffrage caravan campaign and work at bye-elections in opposition to the Government. Official organ, *Women's Franchise*, weekly, 1*d.* Hon. Treasurer, Mrs. Despard. *Hon. Secretary:* Mrs. Edith How Martyn, A.R.C.S., B.Sc., 1, Robert Street, Adelphi, London, W.C.

WOMEN'S FREE TRADE UNION, THE: Founded in 1903, and affiliated with the Free Trade Union (*q.v.*). President, Mrs. L. Harcourt. *Hon. Secretaries:* Lady Frances Balfour and Lady Bamford-Slack, 8, Victoria Street, Westminster, London, S.W.

WOMEN'S INDUSTRIAL COUNCIL: Founded in 1894. Objects: To organize special and systematic inquiry into the conditions of working women; to provide accurate information regarding those conditions, and to promote such action as may seem conducive to their improvement. Conducted on lines strictly non-sectarian and independent of party. The membership is 250. Among the special work done is the promotion of a parliamentary Bill for the better regulation of home industries, and an inquiry into the effects, hygienic and economic, of the work of married women. Official organ, *The Women's Industrial News*, quarterly, 6*d.* President, Miss Clementina Black. *Secretary:* Miss Wyatt Papworth, M.A., 7, John Street, Adelphi, Strand, London, W.C.

WOMEN'S LOCAL GOVERNMENT SOCIETY, THE: Established on a non-party basis, for the United Kingdom. Object: For promoting the eligibility of women to elect to and to serve on all local governing bodies. President, Lady Strachey. *Hon. Secretary:* Miss Leigh Browne, 17, Tothill Street, Westminster, London, S.W.

WOMEN'S NATIONAL ANTI-SUFFRAGE LEAGUE: Founded in July, 1908. Objects: To resist the proposal to admit women to the parliamentary franchise and to parliament; to maintain the principle of the representation of women on municipal and other

bodies concerned with domestic and social affairs of the community. President, The Countess of Jersey. *Hon. Secretary:* Miss Gertrude Lowthian Bell, Caxton House, London, S.W.

WOMEN'S NATIONAL LIBERAL ASSOCIATION: Founded in 1892. Membership (August, 1908), 26,750. President, The Hon. Mrs. Henry Gladstone. *Secretary:* Miss E. E. Page, 138, Palace Chambers, Westminster, London, S.W.

WOMEN'S SOCIAL AND POLITICAL UNION, THE NATIONAL: Founded in 1903. Objects: To secure for women the parliamentary vote as it is or may be granted to men; to use the power thus obtained to establish equality of rights and opportunities between the sexes, and to promote the social and industrial well-being of the community.

During the twelve months ending October, 1908, the Union held nearly six thousand meetings, it has fought twenty-nine bye-elections, it has sold £750 worth of literature, and started a newspaper of its own. Up to October, 1908, the Union had made nine attempts to lay the case for their enfranchisement before the Government in the House of Commons and have suffered arrest and imprisonment to the number of over three hundred. Many women also have faced rough treatment at public meetings in order that they might put questions to Cabinet Ministers. The cash receipts for 1907–8 were over £7000 as against £3000 the year before; the number of subscribers has risen from six hundred to over two thousand. £20,000 has been raised for campaign expenses. The expenditure is £6500 against £2500 last year. Official organ, *Votes for Women*, weekly, 1*d*. *Hon. Secretaries:* Mrs. Pankhurst and Mrs. Tuke, 4, Clement's Inn, Strand, London, W.C.

WOMEN, SOCIETY FOR PROMOTING THE EMPLOYMENT AND TRAINING OF: Founded in 1859. Objects: To promote the employment of women in suitable occupations, by collecting and diffusing useful information on the subject. During the year closed March 25th, 1908, the Society interviewed applicants on 1431 occasions, and 120 visits of inquiry were made by the secretary. Regular engagements had been procured for twenty-one candidates, and those seeking temporary work were employed on 203 occasions. Chairman of Committees, Hon. Victoria Grosvenor. *Secretary:* Miss Gertrude J. King, 23, Berner's Street, London, W.

WOMEN'S SUFFRAGE: The Annual Conference of the International Council of Women, held at Geneva in September, 1908, under the presidency of the Countess of Aberdeen, gave strong evidence of the progress of the women's movement insomuch as it represented nearly seven million women belonging to societies for furthering the general interests of the sex. Delegates were present from Canada, Germany, Sweden, Great Britain and Ireland, the United States, Denmark, New South Wales, the Netherlands, New Zealand, Tasmania, Switzerland, Italy, France, the Argentine Republic, Victoria, South Australia, Austria, Norway, Hungary, Belgium, and Queensland.

In the United Kingdom, after the extraordinary activity displayed by militant advocates for the women's franchise in the earlier part of 1906, a strenuous period followed in which public notice was drawn to these propagandists by the persistent manner in which they endeavoured to extract opinions from prominent parliamentarians by putting questions at public meetings, and by mere clamant interruption. So successful were these advocates for female suffrage that the question quickly leaped into national notice, and came within the area of present practical politics. The question of women being accorded a vote is not, of course, a new one, many bygone statesmen having expressed opinions thereon, notably Disraeli, who said in the House of Commons, "I do not see on what reasons, if you come to right, women have not the right to vote." In 1907 progress was made by the grant of a power to women to become borough councillors, etc., *i.e.* the Qualification to Women (County and Borough Councils) Act. This received Royal assent August 28th, and enabled women to be elected and to act as county or borough councillors or aldermen, and to be elected as mayor.

Lady Trevelyan, in May, 1908, thus commented on the sphere of women's work opened up by the passing of the Act—

"The disappearance of this disability is another step towards the popularization of our local government system. The barriers which kept women from serving on county councils having been broken down, it is important to recall the reasons which make it desirable that suitable women should offer themselves for election on to them, and that the voters should consider their claims, and accept their services.

"As women form half the population, and have the same interests in good administration as have men, and as they pay their share not only of the imperial taxes but of local rates, it is right and just that they should be on the bodies which levy and administer the rates of their district, and which look after the interests of all the inhabitants; and further, women have certain interests to which men cannot, and do not, give adequate and proper attention.

"From the passing of the Act of 1902, till the Qualification Act of 1907, women, although previously eligible, were disqualified from election to the Education Authority. Now they can obtain full responsibility on the bodies which are the ultimate appeal to which Education Committees must refer, and which levy the rates and so provide the money for the education of the district.

"A large field of usefulness is here opened. During the long hours when the child is compelled to attend the elementary school, the State steps into the place of the parents. It has tried to be a good father, but the motherly element should also be present; and this can only be added by women taking their share in the administration of the education of the district.

"Apart from education, the scope of work undertaken and carried out by local governing bodies, is continually increasing, and a large part of their time and energies are spent on what may be called 'condition of people' questions. These grow in number and importance every year. It is notably in these matters that women are most competent to advise, and in which their help as responsible administrators can be most useful. A long list could be made of such powers invested in the County Councils and the London County Council especially. The Small Holdings and Allotments Act is deeply interesting to all interested in the welfare of rural districts and the suburbs of large towns. These matters require the presence of women on the sub-committees that administer them; and as responsible members of the councils they will now be able to have a voice in the general policy, and in the allocation of money grants, so necessary for all reform, and so important to distribute with wisdom and economy.

In Rural Service

"There will never be wanting women devoted to the cause of the young, the sick, the needy and the outcast. Individual effort will always have a noble and honourable place in social reforms, and is especially valuable in pioneer work. But the lifting of our people to the higher standard of civilization, happiness, and health, to which we now aspire, must in a large and increasing part depend upon the good administration by local governing bodies of the powers which Parliament delegates to them for this purpose. In this work women may now assist.

"George Meredith has said, 'Women are the practical sex.' They bring to local government work an all-

important love of detail, and they have often more leisure than men have to devote to matters which make for good and economical administration.

"Women are qualified to inquire into baby farms, to supervise midwives, to inspect female lunatics, and to direct the arrangements of cookery and laundry classes. Women may be presumed to have special qualifications for the organization and management of girls' and infants' Elementary Schools, of Training Colleges for women teachers, and of secondary schools for girls; whilst in the matter of finance we may fairly expect that they will watch over the rise and fall of the local rates at least as carefully as men do at present, and with fully as much appreciation of the important bearing on the prosperity of the community of their good administration."

As mentioned in Miss Christabel Pankhurst's article (see page 1301), the Bill introduced into the House of Commons on March 8th, 1907, was "talked out." A second Bill introduced on August 14th, and embodying more advanced ideas was not discussed.

During 1908 the suffragettes continued to be active in forcing their claims upon the notice of members of the Government, so much so that the intervention of the police, who had previously made many arrests, became more decided, with the result that some three hundred suffragettes were imprisoned for varying breaches of the peace, not the least conspicuous of which was the "raid" on the House of Commons on October 13th, 1908. The event was marked by the unique spectacle of a suffragette rushing up the floor of the House and shouting "Votes for women!"

A Bill to enable women to vote at Parliamentary elections, presented by Mr. Stanger, was read for the first time on February 3rd, and referred to a committee of the whole House after the second reading on February 28th, 1908. The Bill is to the same effect as the one proposed in March, 1907; its salient features are—

1. In all Acts relating to the qualifications and registration of voters or persons entitled or claiming to be registered and to vote in the election of members of Parliament, wherever words occur which import the masculine gender the same shall be held to include women for all purposes connected with and having reference to the right to be registered as voters and to vote in such election.

2. A woman shall not be disqualified by reason of marriage from being so registered and voting, notwithstanding the provisions of any law or custom to the contrary.

The Prime Minister

On May 20th, to a deputation of sixty Liberal members for the purpose of pressing upon the Prime Minister the desirability of granting a measure of women's suffrage, the Rt. Hon. H. H. Asquith said that his own position in regard to this matter was, as they would readily understand, a somewhat delicate one. He had not yet reached the state of grace in which all members of the deputation were no doubt firmly established. But that was neither here nor there. With regard to the practical side of the question, it must be perfectly evident to them all that, however excellent any measure might be, it was wholly out of the question for the Government to think of giving a week, or even two or three days, to any Bill which was not one of their own initiation. He took it that that consideration must be present to their minds, and that they did not press for facilities for a private Bill. They must also be aware that politics were full of surprises, and that sometimes unforeseen accidents occurred which were detrimental to plans, however carefully considered. But, that being said, he regarded it as a duty, and indeed as a binding obligation to the Government, that before this Parliament came to an end they should submit a really effective scheme for the reform of our electoral system. The present state of the law, with its artificialities, its unreasonable delays in obtaining the qualification for the franchise, its indefensible classification of the categories of voters, and, above all, the power of double voting, which was at present conferred upon the class which needed it least—all this urgently demanded reform. No Liberal Government, and no Liberal House of Commons, would be performing its duty if it did not make every effort to get rid of a system such as he had described. This being the Government's intention, it would clearly be within the competence of those present to seek to introduce by amendment, or by extensions, the object they desired. The Government could hardly resist such amendment, for the simple and sufficient reason that probably two-thirds of his colleagues in the Ministry were in favour of it. If it were approved of by the House it could not be any part of the duty of the Government to oppose such an amendment, and therefore the matter must be left to the decision of the House. He must give them one word of warning, however; it must be a distinct condition that any such proposed change must be a change upon democratic lines. Subject to that condition he could not oppose such an amendment, even if he desired to do so, having regard to the state of opinion in the Liberal Party on this question. In conclusion, he pointed out that a measure of women's suffrage such as he had touched on, to be accepted must have behind it the overwhelming support of the women of the country, no less than the support of men.

Mrs. Despard, of the Women's Freedom League (*q.v.*), is a strong believer in adult suffrage, and for long was not quite in unison with other leaders of women's suffrage, insomuch as she upheld that the legitimate channel whereby votes for women might best be obtained was by universal adult suffrage rather than by making the sex distinction. Latterly, however, whilst not relinquishing her views on the general question of the desirability of adult suffrage, she has directed her efforts to securing votes for women by means of a distinctly women's suffrage programme, as being the quicker means to the end aimed at of adequate sex representation.

Probable Benefits

Speaking in March, 1908, on The Economic Aspects of Woman's Suffrage, Mrs. Despard discussed at length the economic position of women, particularly of the workers, as at present existent, and proceeded to unfold how the possession of voting-power would tend towards the general benefit—

"Looking forward to the future, let us see how the possession of the Parliamentary franchise will affect the economic position of woman, and with her, of course, of the community. I do not expect an immediate revolution. I will take, first, the family; secondly, the workshop; thirdly, the State or nation, to each of which the woman undoubtedly belongs.

After dealing with the first section, she proceeded:—

"2. It is needless to urge that women are worse paid and less protected in their work than men. I believe that one of the economic results of the entry of women into politics will be that their long-standing grievances as workers will receive attention; and that consequently their value in the labour-market will rise, while sanitary and other regulations being enforced in places where they toil the strain on their nerves and life energies will be less.

"3. What effect will the emergence of women into politics have upon the inner life of the nation? I believe that the change, though it may move slowly, will be very great. When I speak of the inner life of the nation, I mean such questions as education, land, housing, industry, unemployment, peace and war, the incidence of taxation, and provision for the helpless old and infirm people and

children who have lost their natural protectors. For these matters form the substance of politics, and many of them are demanding treatment of a more drastic nature, perhaps, than has ever been given to them before. Women will go for measures rather than men, rather than party."

June of 1908 was conspicuous for the Women's Suffrage Meeting at Albert Hall, at which ten thousand believers in "Votes for women" were present, and a huge demonstration on June 21st in Hyde Park, London, which was attended by speakers and supporters from all parts of the United Kingdom. It was computed by the *Times* that nearly 500,000 persons were present on that occasion. Over twenty thousand meetings have been held in the United Kingdom since 1906.

A Bill dealing with Parliamentary franchise as a whole, and including franchise for women, married and unmarried, will probably be brought in early in 1909.

The attitude of the Independent Labour Party is favourable to Women's Suffrage, *vide* their resolution at the 1907 Conference: "That this Conference declares in favour of adult suffrage and the political equality of the sexes, and considers that the right of suffrage should immediately be extended to women on the same conditions as to men."

One of the latest developments is the Women's National Anti-Suffrage League (*q.v.*) formed July 20th, 1908, who maintain that Parliamentary suffrage to women would be "fraught with peril to the country."

WOMEN'S SUFFRAGE, EDINBURGH NATIONAL SOCIETY FOR: Founded in 1867. Affiliated with the National Union of Women's Suffrage Societies (*q.v.*). Membership, 410. Official organ, *Women's Franchise*, weekly, 1*d*. Hon. President, Miss Agnes McLaren, M.D. *Hon. Secretary:* Miss J. C. Methven, 25, Great King Street, Edinburgh.

WOMEN'S SUFFRAGE, LONDON SOCIETY FOR: Founded in 1867. Affiliated with the National Union of Women's Suffrage Societies (*q.v.*). The membership is about three thousand. Official organ, *Women's Franchise*, weekly, 1*d*. President, Lady Frances Balfour. *Secretary:* Miss Philippa Strachey, 25, Victoria Street, Westminster, London, S.W.

WOMEN'S SUFFRAGE AND LOCAL GOVERNMENT ASSOCIATION, IRISH: Founded in 1874. Object: To promote the extension of the Parliamentary Franchise and other civic privileges to qualified women on the same terms as men. *Hon. Secretary:* Mrs. Anna M. Haslam, 125, Leinster Road, Dublin.

WOMEN'S SUFFRAGE SOCIETIES, NATIONAL UNION OF: Founded in 1896. A union composed of forty-nine societies operating in various parts of England, Scotland, and Ireland. Official organ, *Women's Franchise*, weekly, 1*d*. President, Mrs. Henry Fawcett, LL.D. *Secretary:* Miss Margery I. Corbett, B.A., 25, Victoria Street, Westminster, London, S.W.

WOMEN'S TRADES, SCOTTISH COUNCIL OF: Founded in 1894. Object: To improve the industrial conditions of women and children, and to furnish statistics and other exact information concerning these conditions. Chairman, Rev. Prof. George Adam Smith, D.D., LL.D. *General Secretary:* Miss Irwin, 58, Renfield Street, Glasgow.

WORKERS' EDUCATIONAL ASSOCIATION: Founded in 1903. Object: To found a working alliance between the Universities and labour organizations. There are 925 affiliated societies, 5257 individual members, and fifty branches. Official organ, *The Highway*, monthly, 1*d*. Presidents, The Bishop of Birmingham, and Mr. D. J. Shackleton, M.P. *Secretary:* Mr. Albert Mansbridge, 24, Buckingham Street, Strand, London, W.C.

WORKING-CLASS MORTALITY: According to the yearly returns for England and Wales, issued June, 1908, by the Registrar-General of Births, Marriages, and Deaths, the death rate per thousand between the ages of twenty-five and forty-five was seen to be: all males, 8·38; occupied males, 7·84; unoccupied males, 36·31; between the ages of forty-five and sixty-five: all males, 25·03; occupied males, 22·73; unoccupied males, 57·01. The favourable percentage of deaths amongst workers is observable in above. A close estimate of the mortality among women occupied in industrial employment, has been attempted by the Registrar-General on more than one occasion, but several contingent circumstances render any precise tabulation difficult, and approximations could only be reached. Out of 502,138 deaths among women during 1900-02, eight per cent. only were returned as having an occupation, whereas an analysis of the 1901 census on the same basis revealed that 34·5 women were given as "occupied." From the data obtained by exhaustive inquiry, the conclusion was arrived at that cotton operatives and domestic servants were healthier at all age groups than other women on the average; charwomen up to thirty-five years of age showed higher than the average of mortality, but as age advanced a more favourable percentage prevailed. Seamstresses and shirtmakers are among the highest death-rates.

June, 1908, Returns

The quarterly return issued on August 20th, 1908, by the Registrar-General gives the total deaths for the United Kingdom for the three months to the end of June, 1908, as 160,895, which represents 14·5 of the estimated population. Of this total, 121,322 occurred in England and Wales, being 63,168 males, and 58,154 females. The ratio to the population showed per thousand, 14·8 males, 12·8 females, total 13·8, or 1·8 below the ten preceding March–June quarters. The violent deaths were 4969.

A comparative table showing death rates in various parts of the world to June, 1908, is given below, from which it is seen London is healthier than any of the towns mentioned except Antwerp.

	Highest per 1000 living.		Lowest per 1000 living.
St. Petersburg	30·8	Antwerp ..	12·6
Moscow ..	30·5	Chicago ..	13·4
Bucharest ..	25·6	Brussels ..	14·4
Trieste ..	23·7	Amsterdam ..	14·5
New Orleans	22·7	Christiania ..	15·0
Prague ..	21·5	Hamburg ..	15·1
Breslau ..	21·1	Berlin ..	15·2
		London .. 12·7	

Scotland

The annual report for Scotland issued in April, 1908, and dealing with vital statistics to end of 1907, gives the total deaths as 77,267, a rate of 16·178 per thousand, and an advance of 1682 on the previous twelve months. Of the total 38,267 were males, and 39,000 females. An analysis of the 1228 violent deaths which occurred in eight of the principal towns in Scotland — Glasgow, Edinburgh,

Dundee, Aberdeen, Paisley, Leith, Greenock, Perth—showed those which might be considered as resulting from industrial occupations to be—

In mines and quarries	1
Vehicles and horses	30
Ships, boats, docks (not drowning) ..	2
Building operations	2
Machinery	3
Weapons and implements	0
Burns and scalds	205
Poisons, poisonous vapours	54
Drowning	126
Suffocation (other than overlying) ..	101
Falls	32

Ireland

The latest annual return for Ireland is that issued in August, 1908, for the year 1907. The total deaths during the twelve months were 77,334, or 17·7 per thousand of estimated population. Of this total, 38,618 were males, and 38,716 females. The violent deaths were 1877, which is forty-three below the average for the last ten years. Of this number 1690 were by accident, of which the following represents the tables covering industrial employment.

	Males.	Females.	Total.
Burns, scalds, and explosions	181	242	423
Drowning	248	58	306
Vehicular	162	19	181
Falls	115	133	248
Suffocation (omitting 74 infants)	14	1	15
	720	453	1173

WORKMEN'S NATIONAL HOUSING COUNCIL: Founded in 1898. Object: To induce municipal bodies to provide houses for the workers at cost rents. There are 150 societies affiliated. Housing Bills are promoted in Parliament, and municipal bodies impelled to build. Official organ, *Housing Journal*, monthly, 1*d*. President, Mr. W. C. Steadman, M.P. *Secretary:* Mr. Fred Knee, 41, Cowcross Street, London, E.C.

Y

YOUNG LIBERALS, NATIONAL LEAGUE OF: Founded in 1903. In August, 1908, the League had one hundred active branches throughout the country, including fifteen in London. President, The Rt. Hon. D. Lloyd-George, M.P. *Hon. Secretary:* Mr. J. Aubrey Rees, 5, Duke Street, Adelphi, London, W.C.

YOUNG TURKS' PARTY, THE: At the beginning of the reign of Abdul Hamid II., Sultan of Turkey, it was supposed that a *régime* of progress would be initiated, and at a very early period a reforming party, led by the enlightened and liberal Midhat Pasha, introduced a scheme for the establishment of a Constitution which was endorsed by the Sultan. A Parliament was actually elected, which sat for a short time at Constantinople in 1876. But its demands and measures so displeased Abdul Hamid that he abruptly dissolved the assembly and exiled Midhat, who ultimately was strangled. The despotic policy of the Sultan grew more and more rigid, and corruption increased in every department of the administration. All the world was shocked by a series of massacres in Armenia and Macedonia. For fully a quarter of a century thereafter steady progress was made in their propaganda by the Liberals known as the Young Turks, whose leading spirits were exiles residing chiefly in Paris. These sent active emissaries throughout the Turkish Empire, and circulated great quantities of revolutionary literature. Some of the Sultan's own relatives were amongst the most active of these enthusiasts. The Sultan showed no alarm, nor did he attempt to make any concessions, until in the summer of 1908 he became convinced through a mutiny amongst battalions sent to subdue malcontents in Macedonia, and the refusal of others to attack these, that the army had been captured by the Young Turks. Major Enver Ahmed Bey of the army staff, though only twenty-eight years of age, is recognized as the military leader of the Young Turkey party. From his headquarters at Monastir in Macedonia he telegraphed to the Sultan in August, 1908, that unless a constitution was granted his forces would march into Constantinople to enforce one. The Sultan yielded quickly, the Government was dismissed, and the Young Turks assumed control. Immediately the whole situation was transformed as if by magic, a proclamation of absolute civil and religious liberty being issued. This Turkish revolution may be considered as part of the general awakening of the East. The outbreak was but a few months later than the upheaval in Persia (*q.v.*).

Z

ZIONISM: Arising chiefly out of the persecution of the Jews in Russia, a colony was inaugurated by the late Dr. Herzl, in 1896, in Palestine, for Jews. Largely through the instrumentality of Mr. Israel Zangwill, Dr. Herzl was induced to present his views to the Jewish public in 1896, before the Maccabæans, after detailing his plans in the *Jewish Chronicle* (*London*), on January 17th, 1896. Briefly the plan was to form a joint stock company for obtaining by purchase from the Sultan permission and land to settle in Palestine, and there form a Jewish commonwealth. In London the movement did not meet with gratifying commendations, but on the Continent such men as Max Nordau, Alex. Marmorek, and Max Bodenheimer, supported it. Later, Messrs. Holman Hunt, Hall Caine, and Rider Haggard were among the prominent men in England to express views favouring Zionism. The work and propaganda have steadily progressed until in 1908 there are some thousands of Zionist branches throughout the world. The British Government made the Zionists an offer in 1903 of land in British East Africa, but it was rejected at the Sixth Congress, in 1905 (Herzl having died in the interim), the delegates preferring to adhere to the original intention of purely Palestinian colonization. The active work of Zionism is in the hands of the Jewish Colonial Trust, who have founded, through the Anglo-Palestine Company, a colony at Jaffa, on similar lines to that started under the same auspices in Jerusalem in August, 1904. A Zionist school exists at Temir Khan Shusa in Daghestan. (See also ITO, ICA and JEWISH COLONIES.)

THE ENCYCLOPEDIA OF SOCIAL REFORM

A

ABANDONED FARMS: The growth of modern commercial centers, the development of factory towns, the increasing part played in economic life by the railroad, the general drift of population from the country to the cities (see CITIES) have led, in certain sections of the country, to the abandoning of farms. The extent to which this has taken place has been by some exaggerated, and the prominence given to the subject a few years ago led to investigations which have shown the exaggeration; nevertheless, the number of abandoned farms, at times at least, has not been small, and the fact has a significance of the most serious character.

ABBOTT, LYMAN: Editor-in-chief of *The Outlook* (New York); born at Roxbury, Mass., 1835. He was graduated from the University of the City of New York in 1853 (D.D., New York and Harvard; LL.D., Western Reserve University), and in 1860 was ordained Congregational minister. From 1860–65 he officiated as pastor in Terre Haute, Ind., and 1865–69 at the New England Church in New York. For three years (1865–68) he was secretary of the American Union Commission (Freedmen's). In 1869 Dr. Abbott resigned from his pastorate, and for several years edited the "Literary Record" of *Harper's Magazine*. He was associate editor of *The Christian Union* with Henry Ward Beecher, and in 1888 succeeded the latter as pastor of Plymouth Church, Brooklyn, resigning in 1898. In 1881 Dr. Beecher sold out his interest in *The Christian Union*, and Dr. Abbott became its editor-in-chief. Later its name was changed to *The Outlook*. Dr. Abbott believes that the problem of political economy is to seek a more equitable distribution of wealth, rather than to promote a larger accumulation of wealth; that social reform calls for a recognition of partnership relations between labor and capital, and the extension of the industrial functions of government. He holds that the principles of the spirit of Jesus Christ applied to social problems would furnish their solution. Among his works may be mentioned: "Christianity and Social Problems" (1897); "The Rights of Man" (1901); "Industrial Problems" (1905). *Address:* *The Outlook*, 287 Fourth Avenue, New York.

ABERDEEN, ISHBEL MARIA, COUNTESS OF: Born 1857. Throughout her varied life the countess has always been interested in the welfare of the people, and so far as she has been able, both in Scotland, and in Ireland and Canada, during her husband's viceroyalties, she has given of her wealth, her influence, and her personal service to the improvement of the conditions under which the people, especially women, live. She has been at various times president of the International Council of Women, the Women's Liberal Federation, Scottish Women's Liberal Federation, and the Women's Industrial Council. In 1900 she edited the "Report of the International Congress of Women." She is the author of "Through Canada with a Kodak." *Address:* Vice Regal Lodge, Dublin, Ireland.

ABOLITION MOVEMENT: Abolitionist is a term used in the United States specifically for those who favored and sought to effect the abolition of slavery. We here consider the subject simply in the United States. (For the general history of the abolition of slavery, see SLAVERY.) It should not be forgotten, however, that the abolition movement in the United States was but a part of this more general movement.

Two tendencies, one from Christianity, the other from French naturalism and revolutionism, contributed mainly to the abolitionist movement in America. Its first open expression was among the Society of Friends or Quakers. As early as 1671 George Fox, in England, had spoken against slavery, and in 1696 the Pennsylvania Quakers advised their members against the slave trade. In 1774 all persons engaged in the traffic, and in 1776 all who would not emancipate their slaves, were excluded from membership among the Friends. John WOOLMAN (1720–73) and Anthony Benezet (1713–84) were prominent in this stage of the movement. In 1774 a Pennsylvania Society for the Abolition of Slavery was formed by James Pemberton and Dr. Benjamin RUSH, and in 1787 was reconstructed under the presidency of FRANKLIN.

Early Abolitionists

The arguments of these earliest antislavery writers and workers were drawn mainly from general philosophic, humanitarian, and Christian principles. With Washington, Jefferson, Madison, Patrick Henry, and other Southerners, all of whom deplored and often spoke against, altho most of them practised, slavery, other reasons entered in. While not insensible to the humanitarian arguments, they based their position largely on the above-mentioned French political principles then spreading through this country, and thus regarded slavery as a giant evil, inconsistent alike with the principles of the Declaration of Independence and the spirit of Christianity. Other abolition societies were organized: In New

York (1785), Rhode Island (1786), Maryland (1789), Connecticut (1790), Virginia (1791), New Jersey (1792). The abolition of the slave trade by Great Britain in 1807, and by the United States in 1808, was a great advance. In 1777 Vermont formed a constitution abolishing slavery, and was soon followed by Massachusetts and other states, while many others gradually abolished it.

In 1819–20, the opponents of slavery made a stern resistance to the admission of Missouri as a slave state, but were defeated. The struggle, however, resulted in the so-called Missouri Compromise (1820), whereby slavery was legalized to the south of 36° 30′ N. Lat., and prohibited in all states that might be formed north of it (Mason and Dixon's line). California, however, tho lying partly south of this line, was admitted as a free state (1850), the Southern party obtaining in compensation the amendment of the Fugitive Slave Law, making it penal to harbor runaway slaves or to aid in their escape. But this is to anticipate. From 1801–47 there were various efforts participated in by Jefferson, Henry Clay, and James Madison, in the South, and Bishop Hopkins, Rufus King, President Harrison, and Dr. Channing in the North, to colonize the blacks in Africa. Liberia was declared independent in 1847. In 1831–32 the insurrection of Nat Turner in Virginia excited a strong desire for gradual abolition.

The first leader in *immediate* abolition was William Lloyd Garrison, a Massachusetts printer who (1829–30) worked with Lundy on his "The Genius of Universal Emancipation," published at Baltimore. In 1831 he began publishing *The Liberator* in Boston, and by 1832 the New England Antislavery Society was formed. In 1833 Garrison visited England and secured from Wilberforce, Zachary Macaulay, Henry Brougham, and others, a condemnation of the colonization societies. Garrison's principles were, in his own words—and they soon became the principles of all abolitionists, however they differed in method—that "the right to enjoy liberty is inalienable"; that "to invade it is to usurp the prerogative of Jehovah"; that "every man has a right to his own body, to the products of his labor, to the protection of law, and to the common advantages of society." He said: "We plant ourselves upon the Declaration of our Independence and the truths of Divine revelation as upon the everlasting rock. We shall send forth agents to lift up everywhere the voice of remonstrance, of warning, of entreaty, and of rebuke. We shall circulate unsparingly and extensively anti-slavery tracts and periodicals. We shall enlist the pulpit and the press in the cause of the suffering and the dumb. We shall aim at a purification of the churches from all participation in the guilt of slavery. We shall spare no exertions nor means to bring the whole nation to speedy repentance." Such were the principles, and such, at least in the earlier stages, were the methods of the abolitionists. Garrison was a firm believer in Christ. He proclaimed himself a follower of the Prince of Peace. Human life he came to regard as sacred above all things. Capital punishment and war, as well as slavery, were to him and to most abolitionists an abhorrence. Viewing the subject thus from the standpoint of morals rather than of any political expediency, slavery was to him a sin not to be gradually abolished, but to be left. In *The Liberator* (vol. i., No. 1, Saturday, Jan. 1, 1831), he wrote: "I will be as harsh as truth and as uncompromising as justice. On this subject I do not wish to think or speak or write with moderation. No, No! Tell a man whose house is on fire to give a moderate alarm; tell him to moderately rescue his wife from the hands of the ravisher; tell the mother to gradually extricate her babe from the fire into which it has fallen, but urge me not to use moderation in a case like the present! I am in earnest; I will not equivocate; I will not excuse; I will not retreat a single inch; and I will be heard."

Immediate Abolition

From the beginning, Garrison had declared for no union with slaveholders, and proclaimed the Constitution "a covenant with death and an agreement with hell." In Dec., 1833, the American Anti-Slavery Society was formed, with Beriah Green as president and Lewis Tappan and John G. Whittier, secretaries. Theodore D. Weld, Samuel J. May, and Wendell Phillips began lecturing. In 1833, Miss Prudence Crandall, in Connecticut, opened her school to negro girls. She was ostracized, the legislature forbade such schools, and she was imprisoned. Riots against abolitionists became frequent. Prices, ranging from $3,000 to $20,000, were reported to be set by the South on the heads of several of the leading abolitionists. The latter sum was offered by six Mississippians for Garrison's head, and the same amount, made up publicly in New Orleans, was offered for the person of Arthur Tappan. In 1837 a slave was burned to death over a slow fire in St. Louis; and for his words in denouncing this, Rev. Elijah P. Lovejoy, a Presbyterian minister who had established an abolitionist newspaper in Alton, Ill., was mobbed and killed. Garrison, in Boston, was seized by a mob, dragged by a rope half naked through the streets, and was only rescued by a *posse comitatus* and conveyed to the mayor's office. Abolitionist lecturers and sympathizers were denounced from the pulpit and subjected to every indignity. Judge Birney declared that "the American churches were the bulwarks of American slavery." Such were some of the obstacles that abolitionist "apostles" had to contend with. Yet while the majority of pulpits either denounced the Garrisonian agitation or else were silent on the subject of slavery, there were ministers in all denominations who were outspoken in their denunciation of this great wrong, and valiantly espoused the cause of the slave. In the Unitarian denomination alone 170 ministers signed a protest against slavery, many of them preaching fearlessly against it, and willingly sacrificing favor and popularity in the cause of freedom.

The American Anti-Slavery Society

As a not unnatural result of the popular prejudice and indifference, the Garrisonian wing now became very radical. They were accused of advocating every kind of innovation, from woman's rights to free love, and were freely denounced as "come-outers" and "infidels." Birney, the Tappans, Gerrit Smith, Whittier, John Jay, Edward Beecher, Thomas Morris, and others left the original organization of the Garrisonians, and in 1840 organized the American and Foreign Anti-Slavery Society. They felt that the time was come for the organization of a new political party, while the Garrisonians continued to radically urge their doctrines through all parties. As a result, in 1840, the Liberty Party

was organized, and in 1840 J. G. Birney was nominated for president, and Thomas Earle, of Pennsylvania, vice-president, polling 7,059 votes. In 1844 Birney and Morris polled 62,300 votes. These were drawn mainly from voters for Clay. As a result, Polk was elected, Texas annexed, and a vast amount of slave soil added to the United States. The policy then began to prevail in the North of advocating limitation of the slave area, and this led to the formation of the FREE SOIL PARTY. In this the Liberty Party was mainly merged, tho a few continued to vote a Liberty Party ticket to a much later date. In 1848 ex-President Van Buren was nominated as president by the Free-Soilers, and polled 291,363 votes.

Meanwhile, the agitation over the Fugitive Slave Law was coming to a head. The Constitution having recognized slavery by Art. iv., Sec. 2 of that document, it was declared that persons held to service or labor in one state under the laws thereof, and escaping to another, should be delivered up on claim of the party to whom such service or labor might be due. To this was added the amendment referred to above on the admission of California as a free state. The demand was made by the Free-Soil Party that this be repealed; yet in 1852 it polled a diminished vote. The same year Harriet Beecher Stowe published her "Uncle Tom's Cabin," which at once produced a remarkable effect in enlightening the people and arousing in them a sense of the injustice and evil of slavery. In 1855 Captain John BROWN went to Kansas to vote, and to fight as well, against the efforts of Missouri border ruffianism and squatter sovereignty to establish slavery in Kansas. The leading abolitionists were eagerly engaged in helping slaves to escape to Canada by means of the "underground railroad," or a series of houses whose inmates were willing to shelter and aid slaves in their secret flight to the North. In 1856 the Free-Soil Party was largely merged in the newly formed Republican Party, with Gen. John C. Fremont as standard-bearer. He polled, however, only 114 electoral votes to 174 by James Buchanan, the Democratic candidate.

In 1856, May 19th and 20th, Charles Sumner delivered his speech in the United States Senate on "The Crime Against Kansas." The speech was an exposure of the cruel injustice of the government of the United States toward the free citizens of Kansas, and was strong and fearless both in its argument and its invective. Whittier said that "it was the severe and awful truth which the sharp agony of the national crisis demanded." It caused intense excitement among the pro-slavery members of the Senate. After the adjournment of the Senate, as Sumner sat writing at his desk, he was assaulted by Preston S. Brooks, of South Carolina, and was so severely injured that it was four years before he could again take his place in the Senate, tho Massachusetts left it unfilled during his absence; he suffered from the effects of the murderous assault as long as he lived.

In 1857 the validity of the Missouri Compromise was rejected by the Supreme Court in the Dred Scott decision. (See DRED SCOTT.) In 1859 John Brown made his effort to rouse the slaves at Harper's Ferry, was captured, and on Dec. 2d, hanged.

In 1860 the success of the Republican Party led to the firing upon Fort Sumter (April 12, 13, 1861) and the opening of the war. The war was not begun to abolish slavery, but simply to put down the rebellion. But the antislavery feeling grew. The fugitive slave laws were abolished in 1864. On Jan. 1, 1863, Lincoln issued, as a war measure, his emancipatory proclamation; and finally, in 1865, Congress passed the amendment to the Constitution abolishing slavery in the United States. On April 9, 1870, the American Anti-Slavery Society disbanded, believing its work fully done. (See NEGRO; SLAVERY; PHILLIPS; GARRISON, etc.)

ABORIGINES PROTECTIVE SOCIETY, THE: An English society which is active on the CONGO QUESTION against the employment of the CHINESE in South Africa, and kindred questions. Secretary, H. R. Fox Bourne, Broadway Chambers, S. W., London, England.

ABRAHAM, WILLIAM: British member of Parliament; born 1842 in Wales; educated in the national schools at Carnarvon. Son of a miner, the lad was early put to the same work. Already in 1873 he was made the miners' agent to conduct their affairs and to mediate when necessary in all questions and disputes between the miners and the operators. He is known everywhere throughout Wales by the name "Mabon." In 1885 he was elected to Parliament to represent the radical interests in the Rhondda Valley, Glamorganshire, a seat he still occupies. He is also president of the Miners' Federation of Southern Wales. *Address:* Bryn-y-Bedw, Pentre, Rhondda, Glamorganshire, Wales.

ABSENTEEISM: The practise of absenting oneself from one's country, station, estate, etc. In sociology it is used mainly of landlords absenting themselves from their lands and letting them out to tenants, the landlords giving no time nor care to their possessions except to receive the rents, which they spend in other places and communities. It has been an especial evil in Russia, France, and Ireland; but it is becoming common also in the United States, where wealthy investors live on their rents, perhaps themselves residing in London or in Paris.

The evils of absenteeism are not hard to discover. There is, first, the loss of interest which a resident is apt to take in the things and persons about him. "It is not the simple amount of the rental being remitted to another country," says Arthur Young, "but the damp on all sorts of improvements." The absentee is also less likely to take account of circumstances (e. g., tenant's improvements), which render rack-renting unjust. He is less likely to make allowance for calamities which render punctual payment difficult. "Miseries of which he can see nothing, and probably hear as little of, can make no impression" (A. Young). He is glad to get rid of responsibility by dealing with a "middleman" or intermediate tenant. Without the softening influence of personal communication between the owner and the cultivator of the soil, the "cash nexus" is liable to be strained beyond the limit

of patience. There can be little doubt but that absenteeism has been one potent cause of the misery and disturbances in Ireland. The cruelest oppressors of the French peasantry before the Revolution were the *fermiers*, who purchased for an annual sum the right to collect the dues of absentee seigneurs; and this evil it is not hard to trace in American life. The proverbial hardness and harshness of the agent who collects rents for absent owners is not invariable, but is frequent. There is, too, the not-to-be-forgotten effect upon the absentee himself of collecting rents from strangers to whom he pays no duties. Sometimes it may be indeed for the good of a community that a rich and luxurious, and perhaps immoral, landlord be absent from it, but this brings us to another subject. (See LUXURY.)

Perhaps the safest generalization is that made by Senior, that "in general the presence of men of large fortune is morally detrimental, and that of men of moderate fortune morally beneficial, to their immediate neighborhood." It must be remembered, however, that to those who hold that land should be held only by those who use it, or that all land should be taxed to its full rental value, absenteeism is an evil incident to the present system that is to be overcome only by the overthrow of the present system. To others it is an evil to be overcome by the greater insistence upon the *duties* as well as the *rights* of wealth. A strong statement of a different but very real form of absenteeism we quote from a suggestive report of the Church League of Lowell, Mass., Oct. 9, 1893:

Industrial Absenteeism

"It is largely true that the labor of Lowell earns the dividends, but they are mostly spent elsewhere, because the stock of the mill corporations is owned elsewhere. Thus we are confronted by the worst kind of absenteeism. The profits earned here go from here, while the mass of poverty, want, and vice that accumulates in every large manufacturing center is dumped on the charity of our churches and the hospitality of our poorhouse. We see the dreary dwellings of the earners of scanty wages; we see the premature age and disability of those broken down by the rapidly increasing speeding of machinery; we confront the intemperance and vice that follow from the hard conditions and hopeless despair of their bettering. The notebooks of our ministers are filled with sad, sad cases of destitution, sickness, and death, made peculiarly sad by the life history of the mill operative."

Professor Hadley, in his "Railroad Transportation" (1886), p. 133, has some pertinent remarks on absentee shareholders.

ABSTINENCE, REWARD OF: An expression in political economy, first used by SENIOR to denote the profits which he considered to be the "natural" reward of the capitalist for the use of capital which he had abstained from using in immediate consumption. The phrase is called "well chosen" by Mill, and has been widely adopted, and undoubtedly contains some element of truth; but it is, nevertheless, considered to be inapt by most economists to-day, since it is at least in great danger of misleading. Thus, when Jevons says, in his "Political Economy Primer," that "Capital is the result of saving or abstinence," he either expresses a mere truism, or states what is very frequently not the fact. If he means that capital is wealth that has not been consumed in other ways, he says what goes without saying; but if he means that capital is the result of saving and abstinence, so that the capitalist deserves to be rewarded because of his self-sacrifice, he implies what is very often *not* the case. All capital is by no means the result of careful saving and economy. It is notoriously very often the result of shrewd and fortunate investment by those who have lived at the same time in the utmost luxury and self-indulgence. It is made frequently by speculation and financiering in the "bulling" and "bearing" of stocks, in the engineering of some corner or combination in the market, in land speculation, and in a hundred other similar ways. Many fortunes have been begun as the result, perhaps, of abstinence and economy at the start, but after this, have been made by the bold, shrewd, and fortunate investment of the little sum. If the reliance had been *simply* on abstinence and economy, there would have been no fortune. G. Bernard Shaw, in the "Fabian Essays," calls "reward of abstinence" that "gleam of humor which still enlivens treatises on capital."

ACADEMY OF POLITICAL AND SOCIAL SCIENCE, THE: See AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE.

ACCIDENT INSURANCE: Insurance against accidents is a recent growth, tho the Hanseatic League seems to have developed a form of mercantile insurance in 1541, and England against the casualties of warfare in 1665. Modern accident insurance was planned in England in 1845, and the Railway Passengers Assurance Company began business there in 1849. Two years earlier (1847) four health-insurance companies had been formed in Massachusetts. In 1863 James G. Batterson formed a Railway-Passengers Insurance Company in Hartford. To-day accident insurance in the United States protects at least a million men and their families, and pays $20,000,000 a year in claims. (See also INDUSTRIAL INSURANCE, and INSURANCE.)

ACCIDENTS IN INDUSTRY: The number of persons who are annually killed or injured in the United States as the result of industrial accidents is only approximately ascertainable in the present state of our vital and labor statistics. It is, however, a factor of such economic and social importance that in many other countries careful and comprehensive inquiry is made into the subject through factory inspectors, or other departments specifically charged with the duty of investigating causes and conditions detrimental to health and life in industry. The vital statistics of the United States census for the registration area contain, it is true, a statement of the number of deaths caused by accidents among occupied males; but there is no conclusive information available as to how many of the accidents reported under death certificates are specifically chargeable against industry or occupations on account of inherent or removable hazards or circumstances dangerous to human life. The nearest approach to an answer to the question as to the number and degree of frequency of accidents and injuries in American industry, is an estimate of the number of deaths occurring annually among all occupied males in the United States generally and in manufacturing and mechanical employments in particular. This, however, does not answer the equally important questions as to the probable number of workmen injured or incapacitated and

the degree of injury sustained, which require separate consideration, and regarding which our present state of statistical information is exceedingly unsatisfactory.

An approximate estimate of the annual loss of life from accidents among occupied males in the United States may be arrived at by the following method. Estimating the male population, ages fifteen and over, for the middle of 1906 as 28,322,000, and applying to this number the accident death-rate for occupied males, returned by the last census as 1.13 per 1,000, the resulting total is 32,004 fatal accidents in the mortality of the entire adult male population of the United States in 1906. In other words, it would appear to be safe to hold, upon the basis of this estimate, that from 30,000 to 35,000 fatal accidents occur annually in the United States among males of ages fifteen and over. An equally useful method is to first estimate the probable total mortality from all causes and then apply the normal percentage of deaths from accidents as determined by the last census for occupied males generally. For illustration, in the male population, as given above, at an annual normal rate of 15.0 per 1,000, as determined by the census, there occur approximately 424,830 deaths from all causes. Since in the mortality for occupied males 7.53 per cent are deaths from accidents, the probable number of such deaths is 31,990 per annum, or about the same as determined by the previous method.

General Estimate

In these estimates I have considered the adult male population as a whole and made no distinction between accidents in general and occupation accidents in particular. It is possible, however, to arrive at an approximate estimate as to the probable number of deaths properly chargeable to industry by the following method. In mercantile employments in which there are practically no occupation accidents, properly to be considered as such, the general accident rate is 0.46 per 1,000, as compared with 1.13 per 1,000 for males in gainful occupations generally. The excess or difference of 0.67 per 1,000 may be assumed to constitute the extra risk from accident in industry in general. If, upon the basis of the population as previously given, we estimate the number of accidents at the rate of 0.46 per 1,000, the annual number of deaths from accidents is 13,028. If this number is deducted from the total previously given, there remains an actual difference of 18,976 deaths from accidents, which would represent the result of employment or exposure in occupations or industries more or less hazardous and detrimental to human life. So that, restating the conclusion, it would appear to be a safe and conservative assumption that in the aggregate American adult male population there occur annually from 30,000 to 35,000 fatal accidents, and that of this number from 18,000 to 20,000 are the probable result of dangerous or hazardous employments.

Accidents, thus defined, comprehend the whole field of injury to men engaged in gainful occupations. *Industrial accidents* proper affect almost entirely those who are employed in factories and workshops or manufacturing and mechanical industries generally, including under this term all the trades and employments of a more or less mechanical nature, at which men work for wages and which require skill and ability beyond the grade of common labor. The number employed in this group, upon the result of the last census, is estimated for 1906 at 5,603,100. The general accident rate of this group, according to the census, was 0.88 per 1,000; and if this rate is applied to the number given, the probable annual accident mortality among adult males in industrial occupations generally is 4,931. Estimated by the percentage method, upon the basis of 6.44 per cent of fatal accidents among deaths from all causes among men in manufacturing and mechanical employments, the probable annual mortality from fatal accidents is 4,980, or almost the same.

In other words, approximately from 5,000 to 5,500 deaths from accidents occur among men in industrial occupations, and the remainder of the accident mortality among occupied males is generally chargeable chiefly against transportation, mining, shipping, fishing, and other dangerous employments. Since the accident mortality of men in mercantile employments is only 0.46 per 1,000, the probable excess in the accident death-rate of men employed in industrial occupations is 0.42 per 1,000, which, applied to the number employed, gives a total annual mortality of 2,353. So that, among men in strictly industrial employments in the United States, the average annual mortality from accidents is about 5,000 to 5,500, of which approximately 2,400 to 2,600 are chargeable against industry as a causative factor materially increasing the mortality from this group of causes.

Annual Average

For an estimate of the probable total number of accidents and injuries in American industry, only fragmentary data are available. The word "accident" has never been defined with sufficient accuracy, so that returns of one state are not strictly comparable with the returns of another. There is even less uniformity in this respect in the returns of different countries. The experience of accident insurance companies is also not useful for the end in view, in that for the protection of the companies against imposition and fraud the word "accident" is more strictly limited in the usage of accident insurance companies than in the returns of factory inspectors or bureaus of labor statistics. For this reason, the fact that, for illustration, the percentage of fatal cases to all accidents is about 1.3 in the experience of a large and representative company would not warrant the use of this figure in estimating the probable number of all injuries in American industry. Then, again, the experience of an accident company includes a large proportion of non-industrial risks on the one hand, and of extra-hazardous risks on the other.

Perhaps the most useful data are the accident statistics for the State of New York, which have been collected and published for the last four years. In the aggregate there have been reported 18,176 accidents during this period, of which 438, or 2.4 per cent, were fatal. If this figure is applied to the estimated number of deaths in industry, previously given as 5,000 to 5,500, the probable total number of accidents of all kinds in American industry upon this basis is from 200,000 to 250,000 per annum. It may be argued, of course, that the data for New York State are not sufficiently comprehensive and representative of American industry in general and that, therefore, the preceding estimate of approximately 250,000 accidents per annum is an overestimation of the facts. This may possibly be so, but, as I have previously pointed out, there is so wide a difference of opinion as to what properly constitutes an accident or injury of sufficient importance to come within the statutory requirements for reporting such accidents and injuries in industry generally, that no two estimates, upon whatever basis they may be adopted, are likely to agree. The New York State returns are in a large measure sustained by the corresponding data for Massachusetts, Wisconsin, and the United Kingdom. In Massachusetts, of the total number of reported industrial accidents, 2.46 per cent were fatal; in Wisconsin, 2.1 per cent; and in the United Kingdom 2.9 per cent. It would, therefore, appear to be a safe assumption that of all accidents in American industry 2.5 per cent are fatal; and if this figure is applied to the previous estimate of the accident mortality in industry, the resulting total is 208,300 industrial accidents per annum. This estimate includes all accidents of sufficient importance to cause at least a temporary loss of earnings, a loss of industrial efficiency, or a temporary suspension of labor.

New York

The data for New York are for twelve groups of industries, including metals and machinery, stone and clay, wood-work-

ing plants, leather and rubber, chemicals and explosives, paper and pulp, printing, textiles, clothing and laundry, food, tobacco and liquors, water, gas and electricity, and building. The space is not available for discussing these industries in detail, but the following table shows, first, the number of accidents in New York State during the four years 1901–4, according to degree of disability, and second, the estimated number of such accidents in American industry generally (5,600,000 male employees).

ESTIMATE OF ACCIDENTS IN AMERICAN INDUSTRY
1906

(Upon the Basis of the Data for New York State)

DEGREE OF INJURY	NEW YORK STATE (1901–4)		UNITED STATES (1906)
	Number	Per cent	(5,600,000 male employees) Number
Temporary disablement:			
Lacerations	3,315	18.2	37,911
Burns	1,136	6.2	12,915
Cuts	3,991	21.9	45,618
Bruises	3,277	18.0	37,494
Sprains	671	3.7	7,707
Fractures	1,219	6.7	13,956
Other injuries	1,069	5.9	12,290
Total temporary disablement	14,678	80.6	167,891
Permanent disablement:			
Partial loss of			
Eyes	94	0.5	1,042
Limbs	79	0.4	833
Hands, feet	136	0.7	1,458
Other parts	2,624	14.4	29,995
Total	2,933	16.0	33,328
Complete loss of			
Eyes	1	0.1	208
Limbs	3	0.1	208
Hands, feet	6	0.1	208
Internal injuries	66	0.4	833
Total	76	0.7	1,457
Total permanent disablement	3,009	16.7	34,785
Deaths	438	2.4	4,999
Not reported	51	0.3	625
Grand Total	18,176	100.0	208,300

I have every reason to believe that the foregoing estimate is conservative, and that the facts of actual experience will conform to the theory. In round figures, according to the preceding table, there occur annually some 200,000 accidents in American industry and industrial pursuits. Of this number some 5,000 are fatal and some 38,000 are of sufficient seriousness to cause either total or partial disability to perform remunerative labor. From an economic point of view, the problem of industrial accidents, in the light of these statistics, is a most serious one. The loss in industrial efficiency alone represents a vast sum of money, to which must be added the cost of illness, nursing, etc. How much of this waste of life and health is preventable cannot be discust without a lengthy consideration of the facts of each industry and occupation. In a not inconsiderable degree the solution of the problem lies with the workmen themselves, while much of it falls properly within the scope of preventive legislation and state control. Some industries are naturally more dangerous than others, while some are practically free from serious risk.

As a brief illustration of the degree of variation in risk, I have made an analysis of the Rhode Island occupation mortality statistics for the decade 1895–1904, and in outline the result is as follows:

Rhode Island

According to the Rhode Island returns for the ten years 1895–1904, there occurred among occupied males generally 18,403 deaths from all causes, of which 1,520, or 8.3 per cent, were deaths from accidents. Among women employed in industrial pursuits, there occurred during the same period 1,251 deaths, of which 43, or 3.4 per cent were deaths from accidents. The difference in the percentages is chiefly the result of a more general exposure of men to hazardous conditions detrimental to life and health. A discussion in detail of the Rhode Island statistics would far exceed the available space. I can only briefly touch upon the more important employments.

In general *mechanical industries* the percentages of deaths from accidents in the mortality from all causes were 7.1 for tool-makers, 6.8 for machinists, and 6.8 for mechanics generally. In the iron and steel industries the percentage was 7.6 and among molders 6.7.

In *general trades* and *industrial occupations* the information is available for seventeen different groups, in which the percentages of deaths from accidents vary between 20.0 for steamfitters and 1.3 for printers. For the separate groups the percentages are as follows: Steamfitters, 20.0; painters, 12.8; boilermakers, 9.7; masons, 9.0; tanners, 8.7; bakers, 7.6; stone-cutters, 7.5; tailors, 6.1; butchers, 6.0; rubber workers, 5.7; jewelers, 5.5; tin-workers, 5.1; plumbers, 4.7; barbers, 3.8; plasterers, 3.8; shoemakers, 2.9; printers, 1.3.

In the *textile industry* detailed returns are available for seven occupations, regarding which the respective percentages are as follows: Dyers, 11.4; carders, 10.5; weavers, 9.4; operators generally, 9.3; superintendents and overseers, 8.7; spinners, 3.1; wool-sorters, 2.6.

Among men engaged in *driving, teaming*, and allied occupations the percentages of deaths from accidents were: Teamsters, 14.7; hostlers, 14.3; cab and hack drivers, 14.3; drivers generally, 8.5; expressmen, 7.9; coachmen, 7.6; livery and stable keepers, 2.9.

Among men engaged in *contracting and construction* work, the percentages of deaths from accidents were: House-movers 60.0; roofers, 33.3; slaters, 25.0; carpenters and joiners, 9.2; and contractors and builders, 5.7.

The preceding occupations include most of the more important industrial pursuits. If the comparison were extended to include men employed in railway transportation, shipping, mining, etc., the less serious character of industrial pursuits would be more apparent.

In four selected groups of mercantile occupations the percentages of deaths from accidents were: For manufacturers, 2.0; merchants, 3.8; clerks and salesmen, 4.5; and storekeepers, 5.7. All these percentages are considerably below the general average, and this is equally true for farmers, with a percentage of 5.4, and gardeners with only 3.6.

While this analysis is limited to the mortality statistics of the State of Rhode Island, it is quite probable that the conditions in manufacturing states or industrial sections generally are about the same. The facts stated emphasize the necessity and social duty of a more qualified and scientific system of factory inspection and the rendering of uniform reports regarding accidents and injuries among persons employed in American industry. (See DANGEROUS TRADES; INDUSTRIAL INSURANCE; MINING; RAILWAY ACCIDENTS.)

FREDERICK L. HOFFMAN.

Dr. Josiah Strong has made some startling but significant comparisons in regard to accidents. He says in a tract, "Safety and Security for American Life and Labor" (1906):

Our peaceful vocations cost more lives every two days than all that we lost in battle during our war with Spain. It has been pointed out that the Pennsylvania coal-fields alone furnish "an industrial Bull Run" annually.

In these piping times of peace, we in the United States kill in four years some 80,000 people more than all who fell in battle and died of wounds, on both sides, during the four years of our Civil War. Records of the War Department show 67,058 killed in action, and 43,012 who died of wounds in the Federal armies; total, not including those who died from sickness, 110,070. Confederate records were largely destroyed, but it is believed that their losses were proportionately severe. Total number of enlisted men in the Union Army, 2,800,000. The War Department estimates total Confederate force at something over 1,000,000 men. This would make total Confederate killed and dead from wounds about 40,000—total, both sides, 150,000.

The number who died by accidents and violence in the United States in 1900 was 57,513. (See Census Bulletin No. 83.) That is, in the same length of time, we are now killing 53 per cent more people than two great armies could destroy equipped with all the weapons of death that ingenuity could then devise, and making destruction their eager business.

We are killing more than twice as many every year as perished by violence in both the French and English armies during the Crimean War. There are more killed and wounded on our railroads every year than the entire losses of the Boer War on both sides in three years.

The perfection of modern firearms rendered the late conflict in Asia exceptionally bloody. The entire losses of the Japanese in killed and wounded were 153,652; those of the Russians 180,134—a total of 333,786. This estimate was made by Gen. Tarker H. Bliss, of the United States General Army Staff, and is officially described as very nearly accurate. The above figures do not include the losses by sea fights, which, however, add only a few thousand.

The casualties of our industrial army are, without doubt, at least fifty per cent greater every year. Of course, the losses of war include many deaths from sickness. These are not considered here because we have no means of estimating the number of corresponding deaths in our industrial army, caused by death-producing occupations. There is, however, a long list of trades which cause premature death, none the less surely because gradually.

A record kept during a part of last year showed 2,555 fatalities in New York City in nine months, which was at the rate of 3,406 for the year—an average of more than nine violent deaths a day.

Without any increase of the annual rate reported by the government in 1900, there will be 575,000 killed every ten years, besides some 5,000,000 injured, even if our proportion of accidents to the population should prove to be no greater than that of France. This is like massacring every inhabitant in three cities the size of Indianapolis, Kansas City, and Denver, every ten years, and at the same time maiming and mangling every man, woman, and child in Washington, Oregon, California, Nevada, Utah, New Mexico, Arizona, Colorado, Wyoming, Idaho, Montana, and Oklahoma, and doing it every ten years.

Is it not time for the public to know the magnitude of these perils of peace? Is it not time to learn that this wounding and killing—more frightful than that of war—is largely unnecessary? Is it not high time to take some active measure to stop it?

Comparing accidents abroad with these in the United States, Dr. Strong says:

Among a given number of coal miners there are more than twice as many fatalities in this country as in Great Britain; the proportion being 2.64 here to 1.27 there. Of a given number of railway employees we kill nearly three times as many, and injure more than five times as many as Great Britain; we kill two and a half times as many, and injure five times as many as Germany; we kill more than three times as many, and injure nearly nine times as many as Austria-Hungary.

Nor must we imagine that accidents have been reduced to a minimum abroad. An investigation of 15,970 accidents in Germany showed that 53 per cent of them were avoidable. If among a given number of employees we have more than twice as many accidents as Germany, and if more than half of Germany's accidents are avoidable, it would seem probable that more than three-quarters of our accidents are avoidable.

ACCUMULATION OF WEALTH: See WEALTH.

ACTORS' CHURCH ALLIANCE: A society founded in 1899 by Rev. Walter E. Bentley, for the purpose of establishing closer relationship between the theater and the church. It appoints chaplains of all denominations to minister to the needs of the dramatic profession and agitates against Sunday performances and other evils of the stage. It has some 3,000 members, about half of these being of the dramatic profession. It is established in more than 400 towns of the United States and Canada, with local chapters in the larger cities, and is affiliated with the Actors' Church Union of England. President, Rt. Rev. H. C. Potter, D.D.; Secretary, Miss O. D. Drescher, 1431 Broadway, New York.

Mr. Bentley says:

One of the strangest facts in our complex civilization is that two of our greatest institutions, the Church and the theater, have been so far apart in sympathy and interest for so many centuries, and with the exception of a few feeble, spasmodic efforts, have not even tried to understand each other. This unhappy divorce has been injurious to both. The stage has lost the guidance and direction of the organized conscience of the community, while the Church in ignoring this great department of social action has lost that touch of nature which the stage supplies, and to that extent its grip on daily life. The Alliance seeks to correct this. It recognizes the stage as one of the greatest educational and ethical forces in society, potent to humanize, even while seeming but to amuse, and contributing so vitally for weal or for woe, to the character and destiny of the nation. It seeks to aid the Church at large in establishing closer relations with men and women following the dramatic profession, by making special provision for their needs and aiding them in any and every way conducive to their welfare. Clergymen of all denominations, Jewish and Christian, are appointed in every theatrical center, their duty being to visit members of the profession as temporary parishioners and to render them every service in their power. They also enlist the sympathies of local managers, and post Alliance calendars giving their names, churches, and services near the call board on the stage of every theater, signifying their willingness to care for any one who may be left sick in their town. Weekly notices are posted to the chaplains from the New York headquarters, giving, in advance, the arrival of the dramatic members, and thus the two are brought into immediate contact and are mutually introduced simultaneously all over the United States and Canada.

Another great aim of the Alliance is the effort to abolish Sunday performances, especially in the West. This is done not only on religious grounds, but also in justice to the actor, who, through this custom, is compelled to work seven days a week for six days' pay. Special Sunday services are provided by the chaplains, where the exigencies of traveling prevent the actor from attending the regular service; and social receptions are held whenever opportunity affords. Thus every effort is made to promote mutual good fellowship. Local chapters, consisting of the clergy, actors, and the public have been organized in about thirty-five of our largest cities, and everything possible is done to encourage and increase the support of the more wholesome drama and to bridge the chasm of misunderstanding between these two great departments of social life.

WALTER E. BENTLEY.

ACTORS' CHURCH UNION: A union formed in England, in connection with the State Church, at about the same time and along the same lines as the ACTORS' CHURCH ALLIANCE (which see). It is now established in about twenty-three metropolitan and 137 provincial counties in Great Britain. The Bishop of Southwark is its president. Honorary secretary, Rev. Donald Hole, 20 Woodview Gardens, Highgate, N. London, England.

ADAMS, FRANCIS: Writer in the cause of labor; born in Malta, 1862. He was educated for the civil service, but instead became a teacher and writer, issuing a volume of verse in 1884. In the same year he went to Australia for his health, and threw himself into the labor movement, issuing his "Songs of the Army of the Night," in 1887. In 1890 he returned to England, broken in health, yet continued to write for the cause of labor to the last, in *The Fortnightly Review* and elsewhere, and issued "The New Egypt" just before a final hemorrhage. On Sept. 4, 1893, he calmly and deliberately shot himself in the presence of his wife, and was buried "with clenched hands" in Margate Cemetery.

ADDAMS, JANE: Head of Hull House in Chicago; born at Cedarville, Ill., 1860; daughter of State Senator J. H. Addams. She was graduated from Rockford College in 1881, whereupon she traveled in Europe for two years. Together with Ellen G. Starr she founded Hull House in 1889, and has continued as its head ever since, developing its steady growth and large success and usefulness. Miss Addams has taken a promi-

nent part in almost every reform movement in Chicago, and even in the United States, especially in all that concerns women, children, and the tenement population. She was at one time appointed inspector of streets and alleys in the Hull House district, and introduced many reforms; and she has served also on numerous municipal and other public committees as well as on innumerable private ones. She has constantly been called upon to deliver commencement and other addresses, mainly upon some subject in social reform, from the standpoint of ethics and democracy; and she has written a large number of articles in magazines and elsewhere. Miss Addams is neither an avowed Socialist nor a Tolstoian, tho friendly to both those views and an active worker for many of their proposals. Her emphasis is upon the ethical side of the social movement, coupled with an insistence upon the democratic organization of industry, largely on socialist and trade-union lines. Among her writings may be mentioned: "The Subjective Necessity for Social Settlements" and "The Objective Value of a Social Settlement," in a volume entitled "Philanthropy and Progress," 1893; a contribution to "Hull House Maps and Papers," 1895; "Democracy and Social Ethics," 1902; "Newer Ideals of Peace," 1907. *Address:* Hull House, 335 S. Halsted Street, Chicago, Ill.

ADDERLEY, Hon. and Rev. JAMES GRANVILLE: Born 1861; educated at Oxford; first head of Oxford House, in East London. During the great dock strike he aided the dockers, raising £800 for them. He has officiated as curate or vicar in the parishes of Barking, Plaistow, Mayfair, and Marylebone, and since 1904 as vicar of Saltley, Birmingham; and he is on the Council of the Christian Social Union. Among his writings are: "Stephen Remarx" (1893), a Christian Socialist novel; "The New Floreat" (1895); "Christ and Social Reform"; "Looking Upward" (1896); "Francis of Assisi" (1901); "A New Earth" (1903); and "Behold the Days Come" (1907). *Address:* The Parsonage, Saltley, Birmingham, England.

ADLER, FELIX: Leader of the Society for Ethical Culture; born at Alzey, Germany, 1851; came to the United States in 1857; was graduated from Columbia College in 1870 (Ph.D., Berlin); professor of Semitic languages and literature at Cornell, 1874–76. In 1876 he founded the Society for Ethical Culture in New York City, and in 1879, under the name of the Workingman's School, he established the Ethical Culture School, which he still directs. Dr. Adler was a member of the Tenement House Commission in 1883, and in 1900 of the Committee of Fifteen. In 1902 he became professor of social and political ethics at Columbia University, the chair being especially created for him. He is chairman of the National Child Labor Committee, and gives much of his time to the work for children. Dr. Adler believes in democracy and in voluntary collectivism, but not in Socialism; in the sacredness of each person's individuality; and that the right democratic spirit will have been attained when the relations to equals, to those in the higher ranks, and to those in the lower ranks of life have been adjusted on an ethical basis. He is the author of: "Creed and Deed"; "Moral Instruction for Children"; "Life and Destiny"; "The Religion of Duty"; and "The Essentials of Spirituality"; and he was one of the founders of *The International Journal of Ethics. Address:* 152 West Street, New York City.

ADLER, VIKTOR: Physician; Socialist; born in Prague, 1852. Educated a physician, he gave up his profession for Socialist propaganda. In 1866 he started the *Gleichheit*, and succeeded in uniting the divided Austrian Socialist Party. He is now editor of the *Arbeiter Zeitung*, the organ of the Austrian Social Democratic Party; and is author of many Socialist tracts and short books on labor chambers, universal suffrage, etc.

ADMINISTRATIVE NIHILISM: A phrase first used by Professor Huxley in an address before the members of the Midland Institute, 1871, to describe the doctrine (which he opposed) of those who believe that the state should be limited in its functions to the protection of its subjects from aggression. The address has since been published under this name of "Administrative Nihilism." Professor Huxley quotes approvingly Locke's maxim, that "the end of government is the good of mankind," and defines the good of mankind as "the attainment by every man of all the happiness which he can enjoy without diminishing the happiness of his fellow men."

ADULTERATION OF FOOD: In political economy this means "the act of debasing a pure or genuine article for pecuniary profit by adding to it an inferior or spurious article, or taking one of its constituents away." In England, as early as the thirteenth century, the legislature attempted, tho with but partial success, to strike a blow against it, showing that it existed even then; but it is modern invention and still more modern commercialism that has mainly produced it. Between 1851 and 1854 in England a sanitary commission, instituted in connection with *The Lancet* newspaper, and most ably conducted by Dr. Arthur Hill Hassall, made revelations of so startling a character that parliamentary action took place; and this, tho at first ineffective, has been improved, till it is now somewhat effective, and has been followed by legislation in other countries.

I.—In the United States

It is in the cheaper grades that adulteration of food is commonly found. The greater temptation would naturally lie in debasing the dearer commodities, but those who buy the dearer commodities have obviously the means to make effective their demand for good qualities, and will not take the poorer. It is thus upon the working class that the burden of debased commodities mainly falls. Not all such deceptions are harmful to health; but they are all swindles, whether harmful or not.

Food Budget

The United States Bureau of Labor in 1904 analyzed the household budgets of 2,567 working-class families. They are not typical budgets, it must be said, but exceptional ones, since these families, averaging 5.31 persons each, had an average yearly income of $827.19. The average working-class family in America has nothing like this income. Fifty-one per cent of the unskilled shoe-workers of the nation receive less than $300 yearly. The general run of textile operatives receive but little more. The Pennsylvania bituminous-coal miners receive but $418.15, and the anthracite miners $684.78 (1904). The 1,300,000 railway workers, including all the salaried officials, average but $631 (1903–4), while the highly paid steel workers receive but $710 (1905). The normal working-class family, even allowing two bread-winners to

each, will probably not average more than $600 a year. The figures are of the utmost importance in considering the relation of household budgets to deceptive and debased foods; for the lower the income the more the family is rendered the prey of adulterations—the more it is forced to renounce the solid and nutritious foods wherein adulteration is least, and the more it is forced to have recourse to the less nutritious foods, including stimulants, condiments, and the like, wherein adulteration is greatest.

Meat, salt and fresh, furnishes 28.45 per cent of the value of the food consumed by these families. This is a high percentage, the actual one for all working-class families being more likely in the neighborhood of 20 or 23. Meat is not yet subject to substitution. But it is, in no slight degree, subject to debasement. If the reports of the special correspondent of the London *Lancet*, of Mr. Upton SINCLAIR, and of many other investigators are to be believed, meat slaughtered in the great packing-houses does not, by a large margin, meet the standard requirements. (See PACKING-HOUSES.)

Adulterated Articles

Lard, which claims 2.86 per cent of the value of the food budget, may be mentioned here, by reason of its supposed kinship to meat. It is very generally adulterated. Forty-nine per cent of the samples reported examined in the Connecticut report for 1903 were "grossly adulterated" with cotton-seed oil. There is also a thing called "compound lard"—tho it is not likely that the qualifying word is generally revealed by the dealer to the average consumer—which is made almost wholly of cotton-seed oil, tho occasionally paraffin shares its company. "Real lard," says the report, "is a minor constituent."

Milk, butter, and cheese form the second highest number in the food budget, 16.12 per cent of the total. The adulterations and debasements in this category are both so extensive and so intensive that space cannot be given for enumerating them. In spite of laws for the inspection of milk in most of the states, its "dosing" with formaldehyde and its adulteration are general. The cheaper grades of condensed milk are almost all frauds. Cheese is rarely the thing it pretends to be. Oleomargarin is still sold for butter, and a thing known as "renovated butter," temporarily transformed, according to Commissioner Blackburn of Ohio, from "unsalable butter in various degrees of putrefaction," is sold in large quantities. But a new process of "faking" butter, which is no more than the solidifying of skimmed milk, threatens an overflow of the markets, particularly in Canada, where it is now being unloaded.

Vegetables count for 9.72 per cent of the food budget. In their native form they are, of course, impossible to substitute. The canned goods, however, are very generally "freshened" or colored with chemical salts and preserved with boracic or salicylic acid. Peas, string beans, asparagus, corn, and tomatoes are all subject to this manipulation.

Sugar and molasses count for 5.34 per cent. Crystallized sugar is generally pure, but pulverized sugar is very liberally adulterated; and most, if not all, of the popular brands of maple sugar and sirup are substitutions. Molasses and fancy sirups are chiefly glucose.

Eggs count for 5.14 per cent and poultry for 2.90. Despite the apparent difficulty of fabricating eggs, the thing is said to have been done with a fair degree of success, tho it is believed that the business has declined. As for real eggs, the deception to the consumer is largely one of pretense as to comparative freshness. But "egg flake" and "bottled egg," which are, or until very recently have been, largely used by confectioners and bakers, are the product of putrid eggs deodorized by boracic acid.

Flour and meal claim 5.13 per cent, and bread 3.81. Not much can be alleged against the purity of ordinary flour and meal, altho the so-called gluten flour, which is generally sold, has been shown by repeated investigations to be largely fraudulent. The case against baker's bread is a much stronger one. Many of the grosser impurities have been reformed out of it, tho it is still freely "dosed" with alum.

Fruit comes to 5.05 per cent. Here is another commodity which in its ordinary form defies "doctoring." Canned or dried, however, it suffers a fate similar to that previously related of vegetables; while in the form of fruit-spreads it is subject to the most brazen and wholesale debasement or substitution.

Coffee and tea claim 4.90 per cent, of which tea represents about one-third. Virtually all sales of coffee to the consumer are fraudulent in one way or another. The average person who thinks he knows what he wants will almost invariably, when purchasing, ask his dealer for Mocha and Java, and it would be a queer sort of dealer who should reply that he had none. And yet, as 98.9 per cent of all coffee imported into the United States comes from Latin America, it is evident that very few persons in this country have ever tasted either Mocha or Java. In addition to this wholesale deception, coffee, especially when ground or pulverized, is very generally adulterated with beans, peas, barley, and other and less wholesome substitutes, while coffee "essence" and "coffee compounds" are almost invariably fraudulent. Tea is carefully inspected at the ports, and only a small quantity of really doctored leaves find their way here from abroad. But there is considerable "touching up" with graphite, adulterating, and even substituting within the country.

Fish is listed at 2.45 per cent. There is a good deal of seizing and destroying of superannuated fish by the health authorities (385,699 pounds in New York City in 1905), a good deal of transforming of one kind of fish into another by our restaurant keepers, and perhaps a certain amount of "touching up" for rejuvenating purposes by our market keepers.

Vinegar, pickles, and condiments are listed at only 1.26 per cent. No one acquainted with the food of the poor in a great city would accept these figures as typical. The real percentage—among the city poor at least—is considerably higher. The stinting of nourishing food develops an abnormal craving for acids, spices, and peppers, which the poor buy in large quantities. This whole class of commodities is subject to the most shameless adulteration and substitution.

A wide range of edibles is comprised in the final entry, "other food," with 6.24 per cent, or, including rice, 6.87 per cent. This total doubtless includes cocoas and chocolates, candy, cake, and ice-cream, breakfast foods and a host of articles such as baking-powders and cream of tartar. Cocoas and chocolates are very frequently adulterated, sometimes with no more than an excess of starch, wheat flour, or maize, but in other cases with foreign fats and insoluble matter. Candy, and particularly cheap candy, is largely adulterated. Said Dr. Lederle two years ago:

"It is, or was, hard to get pure candies. Years ago we found candies actually colored by poisonous colors, one of which was chrome yellow. Then terra alba, a white mineral, was used for 'loading' candy and cheapening it. So far as flavors are concerned, natural flavors have been almost entirely replaced by artificial compounds made by the chemist in the laboratory."

Much of the cake in the cheaper bakeries is unfit to eat, and as for the ordinary ice-cream it would be more appropriately named frozen starch and skimmed milk. Cream of tartar and baking-powder are variously adulterated or substituted, much of the former being nothing more than plain bicarbonate of soda. A report of the New York State Board of Agriculture in 1904 declared eight of seventeen samples to be substitutes.

Pure-Food Legislation

For something like seventeen years strong efforts had been made to induce Congress to pass a pure-food bill. Several minor measures, affecting a few commodities, had been passed, but it was not until the summer of 1906 that a comprehensive bill was enacted. This act, approved by the president June 30, 1906, provides for the fixing of standards in foods, drugs, medicines, and liquors, and prohibits after Jan. 1, 1907, the manufacture of debased or misbranded goods in the territories, the insular possessions, and the District of Columbia, and the introduction of such foods into any state, territory, or possession of the Union. The Secretary of the Treasury, the Secretary of Agriculture, and the Secretary of Commerce and Labor are designated to fix the standards and to "make uniform rules and regulations for carrying out the provisions" of the act.

Under the provisions of the act an article of food is deemed to be adulterated in any of the following circumstances:

(1) If any substance has been mixed and packed with it so as to reduce or lower or injuriously affect its quality or strength.

(2) If any substance has been substituted wholly or in part for the article.

(3) If any valuable constituent of the article has been wholly or in part abstracted.

(4) If it be mixed, colored, powdered, coated, or stained in a manner whereby damage or impurity is concealed.

(5) If it contain any added poisonous or other added deleterious ingredient which may render such article injurious to health.

A proviso, however, exempts certain commodities artificially preserved in cases where the preservative is removable by the consumer, and when instructions are given for its removal. The general tendency of the act will be toward compelling manufacturers to state the character of their goods by proper labels. Dealers who can establish a guaranty from wholesalers, jobbers,

or manufacturers, that goods handled by them are unadulterated or properly labeled, are exempt from prosecution.

W. J. Ghent.

II.—In Great Britain

There was practically no effective legislative control over the purity of the food supply in Great Britain until the year 1875, when the Sale of Food and Drugs Act came into operation. This act provided for the appointment by local authorities of public analysts whose duty it was to examine samples submitted to them by an official acting under the direction of a committee representing what was known as a vestry, a body of local administrators which has now given place to a borough or county council. The appointments are referred to the Local Government Board which to some extent controls the operations of the act. Before the act came into force the practise of adulteration was not merely fraudulent in kind but was fraught also with the gravest risks to the public health. People were not only cheated, they were poisoned. This state of affairs was exposed in a remarkable series of articles which appeared in *The Lancet* from 1851 to 1860, and the appalling conditions soon came to the notice of Parliament, chiefly by the efforts of the founder of *The Lancet*, Mr. Wakley, M.P. for Finsbury. Acts were passed in 1860 and 1872, but these were inefficient. However, since the Act of 1875 was passed, the condition of the food supply has steadily improved, till at last the adulteration of food was confined merely to fraudulent practises, while the use of poisonous substances was virtually stamped out. At the present time it is seldom that cases are brought to notice of poisonous substances having been found in the foods submitted to the public analyst. The Act of 1875 was further strengthened in 1879 and again in 1899.

Sale of Food and Drugs

Meanwhile, however, adulteration has become a fine art, and every conceivable opportunity is taken to deceive the public analyst.

Food is "faked" so cleverly as to defy detection by the ordinary methods of analysis, and this is particularly true in regard to butter. The criterion of genuine butter is a certain proportion of volatile fatty acids, a criterion which is readily satisfied by substituting foreign fats which yield volatile acids in quantity compensating for the poor percentage of genuine butter, if indeed any is present at all. The chief article of food examined in England is milk, and the result shows generally an amount of adulteration equal to 10 per cent of the samples examined. Milk showing less fat than 3 per cent is regarded as having had part of its cream abstracted. Drugs form but a small proportion of the articles examined, but on the whole the results of examination prove satisfactory. The standard for drugs is generally held to be the British Pharmacopœia. It must be confest that analysts in England do not give that attention which ought to be given to substances which involve an arduous examination. For this, however, the analyst can hardly be blamed, since as a rule the fees which he is paid do not compensate him for any special work. The average fee received by the public analyst is usually less than half a guinea per sample. This fee may remunerate him satisfactorily in the case of the analysis of milk or of coffee, but such a fee would not be consistent with a complete analysis of spirits or water.

Clever Adulterations

Recently proceedings have been taken under the Food and Drugs Act against the sale of brandy and whisky, the composition of which did not accord with that of the genuine articles made entirely from grape and malt. Standards for genuine brandy and whisky have been laid down, which depend upon the amount of by-products of fermentation and distillation other than alcohol found in genuine brandy and whisky. Convictions have thus been obtained under the operations of the Food and Drugs Act. The fact that it can be proved by analysis that both brandy and whisky are frequently nothing but spirit derived from grain in the patent still, has thrown the spirit trade into a condition nothing short of alarm. There is no doubt that substitution has been practised by this industry for a long time; and the general opinion is that a clear and accurate description of the spirit sold for consumption should be declared on the label.

There is no immediate prospect of any serious fresh legislation of a general kind being made in England in regard to the adulteration of food. It is probable, however, that extra steps will shortly be taken in order to protect the public from the extensive watering of butter that goes on, and also its sophistication with foreign fats. Under the name of milk-blended butter, a good deal of that article is sold which contains no less than 25 per cent of water, and this retailed at 1 shilling per pound. It is a clever ruse on the public, and will probably be dealt with by a special statute. The samples of food and drugs examined annually by public analysts number about 50,000, and generally a third of this number consists of samples of milk. The rate of adulteration for all samples is approximately 10 per cent, a figure which year by year has shown slight reduction. The extent of adulteration, however, is probably greater than this, since when samples are obtained in an unofficial way the percentage of adulterated ones rises considerably. In past years the penalties have been too trifling to deter offenders from repeating the offense; but recently the fines inflicted have been much heavier, and with a salutary effect.

Legislation

It is to be regretted that England is still without any definite statutes concerning the use of preservatives and coloring-matters. A special departmental Committee was appointed several years ago to consider this question, and its members issued in 1901 a report containing their recommendations. These recommendations have never become law, altho the opinion of the public analysts has been guided by this report, and prosecutions have succeeded on the strength of the conclusions of the Departmental Committee. Briefly, these conclusions were that preservatives and coloring-matters should be absolutely prohibited from being used in milk and all other articles of food intended for infants or the sick, that formaldehyde be prohibited altogether, that borax compounds be allowed in limited quantity in cream and in butter, and salicylic acid in wines, etc., to the extent of one grain per pint. The use of copper salts for greening vegetables was condemned.

On the whole it may be said that the Sale of Food and Drugs Act is working well, and certainly since its inception the quality of the food supply has greatly improved; but evidence is not wanting that the act requires amendment in several directions, and public attention is being drawn to the fact. Perhaps the weakest section in the act is that which allows a dealer to sell any adulterated goods so long as he declares the fact. There is little doubt that tho this disclosure is publicly made by a notice in the shop or on the label of the goods, the public in many instances are careless and pay little regard to such declarations, or else the announcement escapes their attention on account of its being printed in small letters or in an obscure place. Of course, when the inspector appointed under the act gets samples in this way, the defense is that the fact that the goods were not genuine was

Effects of the Act

disclosed at the time of the purchase in one of the ways indicated. In most of the public houses in England a notice commonly hangs in the bar pointing out that the spirits are diluted with water "in compliance with the requirements of the Food and Drugs Act"!!! In some restaurants it is even declared that the milk sold cannot be guaranteed to contain its full complement of cream. Such methods are calculated to defeat the aim of the act, which is to provide the public with food of good quality and to protect them against fraud.

S. Archibald Vasey.

ADVERTISING: In the early and middle ages signs and criers were used for this purpose, and the public crier gradually became a necessary and important officer. The first advertisement in the United States appeared in *The Boston News Letter*, a two-page paper (8 inches by 12), in 1704. The first number of advertisements appeared in *The New England Weekly Journal* (Boston, 1828), and pertained to books, coffee, runaway slaves, sale of negro girls, etc. The New York *Sun*, established in 1833, contained advertisements of various kinds, tho not as numerous as at the present time. The first newspaper advertising agency was established in Philadelphia in 1840, by Volney B. Palmer. To-day there are more than 600. Magazine advertising began with *Scribner's Monthly* in 1870.

Growth of Advertising in Newspapers and Periodicals in the United States

Year	Subscriptions and sales	Advertisements	Per cent
1880	$49,000,000	$39,000,000	44
1890	72,000,000	71,000,000	49
1900	77,000,000	95,000,000	54

It is this advertising which makes possible the educational work (good and bad) of the daily press and of the weekly and monthly magazines. The amount expended in newspaper and periodical advertising in the United States was put by the census (1900) at $95,861,127. Advertising on bill-boards, fences, etc., has been estimated at $1,250,000 annually; street-car advertising at $2,000,000; lithographing (folders, etc.) at $15,000,000. These estimates are probably far too low. The total has been estimated at $600,000,000 annually. Mr. Post spends $600,000 annually in advertising his food products. $1,000,000 was spent in 1893 in advertising the breakfast food known as "Force," and more than $1,000,000 is spent annually in advertising "Peruna." A soap firm gave a three-years' contract to a magazine for a one-page advertisement at $4,000 per month.

Socialists believe that much of the money spent in advertising is an economic waste due to competition; but $95,000,000 expended on newspaper and periodical advertising is less than 1 per cent of the commerce of the country, spent for making it known. Movements and societies have recently been started, making propaganda against the abuse of advertising in beautiful and historic places, as well as against immoral and indecent advertising. The best known of these is the London "Society for Checking Abuses in Public Advertising" ("Scapa"), 1. Camp View, Wimbledon Common, S. W. London. Some cities have passed ordinances on the subject. For the United States, see American Civic Association.

Total Africa	11,403,000	148,669,000	13	2,665,000	2,493,500	3,799,000	381,000	48,752,500	90,578,000

[1] Nile valley.

There are 14,178 miles of railroad in Africa, distributed as follows: Algiers and Tunis, 3,039; British Possessions, 3,671; Egypt, 2,885; Orange Free State, 596; other countries, 3,987. (See also Cape Colony.)

AGAPE: A love-feast, or feast of brotherhood and social communion, in the early Christian Church. The name comes from the Greek word *αγάπη*, signifying love. At these feasts the rich Christians presented their poorer brethren with gifts, and all sat around the tables and ate together as a token of their equality before God. The utmost harmony and fellowship prevailed. Prayer opened and closed the meeting, and a bishop or presbyter presided. A portion of Scripture was read, expounded, and discust; and during the feast spiritual songs were sung. If any communication had been received from another church, or from an absent member or bishop, it was publicly read. Money was collected for widows, orphans, prisoners, the poor, and those who had suffered shipwreck. At the close the members embraced, and a "philanthropic prayer" was pronounced. A spirit of practical sympathy

and benevolence prevailed. The participators did not seek for private spiritualities nor for personal enjoyment, but acted as "members one of another." In the second century persecutions checked the agape, and in the third and fourth centuries they degenerated into a kind of banquet, where the deaths of relatives and martyrs were commemorated, and where the clergy and the poor were guests. The increase of wealth at last rendered their original purpose abortive, and transformed them into positive evils, and too often scenes of iniquity. Councils denounced them for their riotousness and debauchery, and finally banished them altogether.

The agape have been revived by the Moravians, who hold solemn feasts where wheaten bread and tea are set before the participants, and where prayer and praise are offered up. (See GILDS.)

AGE OF CONSENT: The "age of consent" is the age of the female below which carnal connection, either with or without consent, is declared rape, and the male is liable to punishment therefor. In all the states of the Union and in sections under government control, as the territories and the District of Columbia, as well as in all civilized foreign countries, legislators have recognized the fact that innocence should be protected from the designs of vicious men. Therefore the statutes provide that below an age varying in different localities no maiden may legally consent to carnal connection with a male of an age of discretion, which is placed usually at seventeen years. Tho the maiden may consent, the law holds that the male is liable to punishment just as if she had resisted, provided she is below the age limit set.

According to the common law of England, a female becomes a woman at twelve years of age. Until the year 1885, the age of consent in Great Britain, therefore, was the end of the twelfth year. In 1885, by the Criminal Law Amendment Act, carnal intercourse with a female under the full age of thirteen years, was made a *felony*, punishable by penal servitude for life or for any term not less than three years, or by imprisonment for any term not exceeding two years, with or without hard labor. The act further provides that carnal intercourse with a female between thirteen and sixteen years shall be deemed a misdemeanor, punishable at the discretion of the court by imprisonment for any term not exceeding two years, with or without hard labor.

In Great Britain

As the laws of the United States are based on the English statutes, it follows that in all of the original states the age of consent was held to be twelve years. In one or two of them, however, it was fixed as low as seven years.

These facts, coming to the notice of earnest people whose hearts had been stirred by the agitation for moral purity, started and sustained by Mrs. Josephine Butler, Wm. T. Stead, and others, in England, efforts were put forth in several states to raise the age of consent from seven or twelve years to an age where greater experience and knowledge of the world would constitute more adequate protection.

This movement has become general; and in nearly every state the age of consent has been raised to sixteen or eighteen years, and in one state—Wyoming—to twenty-one years. The greater number have placed the age at sixteen years; and in some of these states it is not likely to be raised higher, as in them a girl of sixteen is allowed to marry without the consent of her parents; and legislators are not inclined to raise the age of consent above this point.

In the United States

According to a careful canvass the age of consent in each of the different states is as follows:

TEN YEARS: Georgia; Mississippi.

FOURTEEN YEARS: Alabama; Missouri; Nevada; North Carolina; South Carolina; Virginia; West Virginia.

FIFTEEN YEARS: Texas.

SIXTEEN YEARS: Arkansas; California; Connecticut; Illinois; Indiana; Iowa; Kentucky; Louisiana; Maine; Maryland; Massachusetts; Michigan; Minnesota; Montana; New Hampshire; New Jersey; Ohio; Oregon; Pennsylvania; Rhode Island; South Dakota; Vermont.

EIGHTEEN YEARS: Colorado; Delaware; Florida; Idaho; Kansas; Nebraska; New York; North Dakota; Tennessee; Utah; Washington; Wisconsin; the District of Columbia (Washington City), and territory under government control.

TWENTY-ONE YEARS: WYOMING.

Two States, Alabama and Delaware, have followed the method adopted in Great Britain of making the punishment more severe when the female is under ten or twelve years, and lighter between that age and fourteen or sixteen years. One State (Georgia) is reported to have no statute which exactly covers the case.

It is greatly to be desired that those states in which the age limit is below sixteen years will speedily amend their code so as to place the limit at sixteen or, better, eighteen years.

At present there are not sufficient data obtainable to accurately describe the conditions that exist in foreign countries relative to the age of consent. As legislation abroad is quite conservative and governed largely by precedent, it is not to be expected that the same advance has been effected as in this country.

O. EDWARD JANNEY.

AGRARIAN PARTY: A German political party, formed in 1869, under the leadership of M. A. Niendorf and Elsner von Gronow, to represent the interests of the landlords. The party has endeavored to abolish taxes on land, and to limit the importation of foodstuffs. Its influence is considerable, as it has largely dominated the conservative interests in the Reichstag.

AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS: The first agricultural school was founded by Fellenberg at Hofwyl, Switzerland, in 1806, and endured thirty years, educating 3,000 pupils. The Albert Institution, a great agricultural college, was founded at Glasnevin, near Dublin, Ireland, in 1838. In England a private experimental station was started at Rotham in 1843. The Royal College of Agriculture at Cirencester, England, was commenced in 1845, and a college of agriculture at Downton, in 1880. Various English colleges and universities have now agricultural departments. Grants of money in aid of agricultural education are made through the Board of Agriculture. Traveling-schools with dairy apparatus have been started. In Canada there is a successful agricultural college at Guelph, Ontario. Most of the Australasian colonies have agricultural colleges.

France has an elaborate system of agricultural

education under the national government, with the Institut National Agronomique at the head. There are three national schools of agriculture, with many secondary schools. Since 1879 instruction in agriculture, horticulture, and natural history has been obligatory in normal and primary schools. Belgium has developed a similar system. Denmark is giving much attention to this work, with an agricultural college at Copenhagen and numerous agricultural schools. Germany has no developed system, but many universities and industrial schools have agricultural courses. Italy, Sweden, Norway, and Russia are developing schools and colleges. Traveling instructors are employed in Norway and elsewhere. Germany has more than 100 experiment stations; France has 70; Austria 41.

In the United States the first agricultural college was established at Cleveland, Ohio, in 1855. Under the provisions of the acts of Congress of July 2, 1862, and Aug. 30, 1890, colleges having courses in agriculture are in operation in all the states and territories. In 1857 a bill was introduced by Senator Merrill of Vermont, who became a leader in the movement, and in 1862 a bill was passed donating land in each state for agricultural colleges. In 1887 Congress also appropriated $15,000 in each state for agricultural experiment stations. To-day there are sixty-six agricultural colleges, and there are experiment stations in nearly all the states and territories. Wisconsin started the first dairy school.

The total number of students in all departments of these institutions during the year ended June 30, 1904, was 53,161, of which number 6,726 were enrolled in institutions for colored students.

Of the students in the college departments, there were enrolled in regular four-year courses, as follows: Agriculture, 2,096; horticulture, 209; forestry, 26; mechanical engineering, 3,767; civil engineering, 3,222, electrical engineering, 2,936; mining engineering, 922; chemical engineering, 285; railway engineering, 3; sanitary engineering, 32; textile engineering, 95; general engineering, including unclassified first-year engineering students, 746; architecture, 227; household economy, 674; chemistry, 444; general science, 1,707.

There were enrolled in short courses as follows: Agriculture, 3,651; horticulture, 69; dairying, 673; mechanic arts, 1,145; household economy, 647; mining, 93.

The total income of the institutions, excluding the amount received for experiment stations, was $10,885,550, of which amount the several states and territories contributed $5,654,758, and the amount received from federal sources was $2,045,963.

The total value of all property amounts to $74,564,424, of which sum $28,388,826 is invested in interest-bearing securities.

The total income of the experiment stations in 1905 was $1,515,734, and they employed 845 persons. Of this work the Secretary of Agriculture says (1906):

The farmer will not fail the nation if the nation does not fail the farmer. He will need education to know the powers of the soil which are now hidden from him. The prospective yearly expenditure of $10,000,000 for educational and research work by nation and states, with such increases as may come from time to time, must have enormous effects. There may be agricultural schools for the small children, and agricultural high schools for the larger ones, and their education will be continued in the colleges.

The work of the Department of Agriculture has already had results which are valued at hundreds of millions of dollars annually, and yet the department feels that it has barely crossed the threshold of its mission of discovery and education. Cooperating to the same ends are 60 experiment stations in 51 states and territories, the 63 agricultural colleges, thousands of farmers' institute meetings yearly, many excellent agricultural periodical publications and new instructive books. Then there is a new line of work which is so productive of results that it is constantly extending, and that is the demonstration farm, the encouragement of individual farmers to change their agriculture so as to multiply their yields and their profits, and thus afford object-lessons to other farmers.

Thus it appears that forces are now at work which will very considerably increase the production of the farms within a generation, and which promise to continue the increase indefinitely.

In 1905 the secretary said:

Recent years have also witnessed the development of a great system of popular agricultural education for the adult farmer through the farmers' institutes which are now held throughout the country and annually attended by about a million men and women engaged in agricultural pursuits. With the growth of the research work of this department and the experiment stations it has become very evident that publications alone would not meet the demand for information regarding improved methods of agriculture and the ways in which the results of scientific investigation may be applied to agricultural practise. The absence of agricultural instruction in the schools and the coming on to the farms of millions of people from foreign lands, together with the wide-spread interest in the results of agricultural research, have made it necessary that means be devised for giving agricultural people instruction by word of mouth which will enable them to understand and utilize the information so largely given out in the publications of this department and the stations.

For this purpose the farmers' institutes established under public authority in the states and territories furnish an agency of great usefulness. It has therefore seemed highly desirable that this department should ally itself closely with the farmers' institutes, and make them efficient instruments for the wide diffusion of the knowledge gained by the department and other agencies for agricultural research. With this end in view a farmers' institute specialist was appointed two years ago in the Office of Experiment Stations, and efforts have been made to place at the disposal of the institute lecturers the information gained by the department in many lines.

AGRICULTURAL LABORERS: See AGRICULTURE; WAGES.

AGRICULTURAL ORGANIZATION SOCIETY, THE: Founded in England in 1901, by the amalgamation of the British Agricultural Organization Society with the National Agricultural Union. Its object is education and the development of cooperation in British agriculture. The society (*a*) advises with regard to the preliminary steps to be taken in the formation of a society; (*b*) supplies model rules giving societies a legal constitution without trouble or expense; (*c*) gives information concerning the working of other societies, with the object of mutual help and experience; (*d*) is in a position to negotiate with firms in a manner impossible for a local society; (*e*) institutes systematic methods of administration in order to secure good management. The number of societies affiliated with the Agricultural Organization Society in 1906 was 140. Secretary, J. Nugent Harris, Dacre House, Dacre Street, Westminster.

The Irish Agricultural Organization Society has 718 societies affiliated with it (see IRELAND) with 76,334 members. Secretary, R. A. Anderson, 22 Lincoln Place, Dublin.

AGRICULTURE: The importance of the part played by agriculture in the economic, commercial, and industrial life of man, and the gravity of the economic problems involved, it is impossible to overestimate. In most countries more people are engaged in agriculture than in any other class of occupation. In the United States (1900) it was 35.7 per cent; in Hungary (1900), 68; in Italy (1901), 59; in Russia (1897), 58; in Austria (1900), 58; in Sweden (1900), 49; in Denmark (1901), 48; in France (1896), 44; in Ireland (1900), 44; in Norway (1900), 41; in Germany (1895), 37; in Switzerland (1888), 37; in Holland (1899), 30; in Belgium (1900), 21; in Scotland (1901), 12; in England and Wales (1901), 8. These figures include those engaged in fishing.

This, however, shows only the direct importance of agriculture. Indirectly it influences all

occupations. If the agricultural population is prosperous, it must affect every other class, and vice versa. This is not only because every man and woman and child must consume the products of agriculture, but because the size of the farm population makes it the one great market for almost all manufactured articles which relate to the necessities of life, and because the agricultural element affects politics and furnishes the great bulk of materials of commerce. It was not until the tribes of the world first commenced agriculture and gave up their nomadic habits that civilization can be said to have really commenced. On the other hand, there is probably no occupation so affected by the varying social and political conditions of man as agriculture, because no occupation so depends for its life on settled habits, peaceful life, and general prosperity.

Indirect Influences

Yet, important as it is, agriculture to-day faces the most serious problems in the greatest countries of the world: the U. S., Russia, Germany, to a less extent in France, but in Great Britain most of all. The drift of population to the city, and of industry to manufacturing and trade, has meant to a serious extent the decline of agriculture. Mr. James J. Hill (see below) says: "Agriculture, in the most intelligent meaning of the term, is something almost unknown in the U. S." In Great Britain the agricultural problem has been acute for the last thirty years. In Russia a changing political condition, commencing with the freeing of the serfs, has driven millions from their former feudal tenures of land, without economic ability to get land or maintain independence. In other countries, tho less seriously, agriculture has also suffered by the movement toward the city and toward manufacturing and trade. In most countries, too, especially in the U. S., all that the farmer buys, and the transport and marketing of his crop, are passing under the control of the monopolist and organizer of trade, while agriculture itself is the most difficult occupation to organize, so that often the agriculturist seems to have to cope single-handed with a market under the bond of combination. To-day there is, however, a wide-spread revival of interest in agricultural development, and a very general effort at agricultural education. The farmers are beginning to cooperate in many ways, but theories of reform differ.

Early political economy, especially among the Romans, had much to say about agriculture. Cato, Cicero, Seneca, Pliny, Varro, and Colomella treat agriculture in a half patronizing, half dilettante way, but yet give some good suggestions and teach the importance of all men having something to do with agriculture, and recommend small farms and free labor. It is a sad comment on their lack of earnestness that Rome fell largely on account of its large farms, tilled by slave labor.

The period of the Middle Ages was too stormy to develop much thought on agricultural lines, tho many of the monasteries and some of the greatest monks and bishops gave good examples of Christian cooperation and community life in the tilling of fields with their own hands and for the common good.

Physiocrats

It is, however, the French Physiocrats, headed by Quesnay and Gournay, who have placed the greatest importance on agricultural production. With them agriculture (including mining, as, in a sense, the cultivation of the soil) is the only industry that produces wealth. Commerce and manufacture, they held, only change the form and place of wealth. All taxes, therefore, they taught should be placed on land; hence they are the true progenitors of the single tax. Their doctrine, too, fell in with the tendency to revert to nature and simplicity, taught by Rousseau and the "natural" school. Adam Smith brought thought back to more balanced views; but the rising industrialism, developed by the invention of machinery and steam power, drew men away from agriculture. There was a rush into industry, and agriculture was neglected. The land, in England especially, fell under the control of great landowners, who leased their farms out at will, usually to tenants, and left the agricultural laborer often as poorly paid and less cared for than the slave. Slaves cost money; laborers could be had for the asking. The chain-gang and the lash were common sights on English fields, and the homes of the English laborers were more rotten than slave pens. The more balanced views of Adam Smith were forgotten in carrying out his principles into the doctrinaire position of Ricardo and the orthodox school. Malthus's conclusion as to the law of population, that it was necessary that the poor perish, stilled England's conscience. To buy in the cheapest and to sell in the dearest market was considered a law of God. Labor was a commodity that must obey this "natural" law. The repeal of the Corn Laws marked an epoch in the development of agriculture and in the world.

J. S. Mill

J. S. Mill is the first writer to treat the agricultural question from both a moral and an economic basis; yet, in his economic teachings, as contrasted with his socialistic philosophizings, he scarcely departs from the orthodox position. He compares the English system of large farms owned by lords (*la grande culture*) with the French, Flemish, and Rhenish systems of peasant proprietorship, or small farms owned and operated by peasants, and draws a strong argument in favor of the latter, saying, "Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him a nine years' lease of a garden, and he will convert it into a desert." He shows also that small farms owned by their operators increase production, because more labor and more fertilizing are expended upon each farm than would be on the same land less divided. Following Mill, economic writers have taken one side or other of this question, either favoring *la grande culture* or peasant proprietorship, but, until very recently, for the the most part conforming to the view of Mill. *Metayage* (see METAYER), or the system of the peasant leasing and operating a farm on the condition of giving the landlord half of the produce—a system prevailing mainly in Italy and other southern European countries—has had some advocates, but not many.

"La Grande Culture"

Facts, however, are leading many minds to-day in another direction. It is being found that small farming does not pay. Mr. D. A. Wells said as early as 1889, "that the only possible future for agriculture, prosecuted for the sake of producing the great staples of food, is to be found in large farms, worked with ample capital, especially in the form of machinery, and with labor organized somewhat after the factory system, is coming to be the opinion of many of the best authorities, both in the U. S. and Europe" ("Recent Economic Changes," p. 460). Mr. Wells adds in a note:

An American practical farmer, the owner and manager of 7,000 acres (Mr. H. H——, of Nebraska), to whom the writer is indebted for many items of information, communicates the following additional review of this subject from the American (Western) standpoint: "The average Western farm is now recklessly managed, but capital will come in greater volume and set up processes which will displace these wasteful methods. The revolution is certain, even if the exact steps cannot now be precisely indicated. At present the hay, and much of the grain, and nearly all of the tools and implements are unsheltered; and more than 50 per cent of the hay is ruined for a like reason, while the animals themselves (I do not mean now on the wild-stock ranges, but even on the trans-Missouri farms) have no roof over their heads, except the canopy of heaven, with the mercury going occasionally 20° and even 30° below zero. These wasteful methods in farming are in part promoted by the U. S. Homestead law and the occupation of the hitherto inexhaustible expanse of cheap lands. When the ignorant, degraded, and impecunious can no longer acquire 160 acres upon which to employ their barbarous methods, and when the land already taken up

shall have risen from the low prices at which it now stands to $50 or more per acre, a new dispensation will arrive. Neither the cattle nor the food which the cattle consume will then be raised by any such methods as now prevail; neither will they be exposed to the elements in winter. True enough, the opening up of other virgin fields in Australia, South America, Africa, and elsewhere may retard this rise in the value of the land in the western part of our continent, and thus to a certain extent delay the passing of the land exclusively into the hands of larger capitalists and better managers; but it must be considered that not all climates are suitable for energetic, capable farming populations, and likewise that the best forage plants are restricted to temperate latitudes."

Already the process of displacing the small farms by large farms, operated by capitalistic labor, is far along in the U. S. (See HOMES.) Says a writer in the "Fabian Essays":

Capitalism

Even agriculture, that one occupation in which old-fashioned individualism might be supposed safe, is being subjected to capitalism. The huge farms of Dakota and California, containing single fields of wheat miles long, are largely owned by joint-stock corporations and cultivated exclusively by machinery. These huge farms, combined with the wheat "corners" in New York and Chicago and the great railway corporations of America, have played havoc with many of the small farmers of the Mississippi valley, as the statistics respecting mortgaged farms will show. And when it is remembered that the American farmer will be more and more obliged to meet the growing competition of the wheat of India, produced by the cheapest labor in the world, his prospects do not appear very bright.

For several years past, however, general trade conditions, connected with unusually large crops, have prevented disaster to the farmer in the U. S. He has been enjoying a period of unexampled prosperity, and has been paying off his mortgages, and accumulating wealth. Said Mr. James Wilson, U. S. Secretary of Agriculture, in his report for 1906:

Official Report, 1906

Economic revolution in the art and science of agriculture, which became noticeable in this country half a dozen years ago, has continued during 1906, with tremendous effect upon the nation's prosperity. Crops so large as to be beyond any rational comprehension have strained the freight-carrying ability of railroads. Directly and indirectly the farmer has set up a demand for iron and steel that has exceeded the productive power of the chief producer among nations. His contribution to the supply of loan capital has been beyond calculation and recalls the fact that the depression in the loan and investment market of 1903 was cleared away by the following crop.

Meanwhile the farmer has been a generous consumer, and has given powerful support to the market of the industrial producer, to the trade of the merchant, and to the wages of the workingman. The farmer has become aware of the importance of the place that he occupies in the republic, and in the pride of his occupation he is ready to offer this yearly account of himself to the people. . . .

Taken at that point in production at which they acquire commercial value, the farm products of the year, estimated for every detail presented by the census, have a farm value of $6,794,000,000. This is $485,000,000 above the value of 1905, $635,000,000 above 1904, $877,000,000 above 1903, and $2,077,000,000 above the census for 1899. Farm products continue to be so far beyond the national requirements that the farm still overshadows the mill, the factory, and the workshop in providing exports. With his surplus beyond the nation's need, the farmer has loaded the fleets of oceans. These products were exported to the value of $976,000,000 during the fiscal year ending June 30, 1906—enough to build a high-class railroad half-way around the earth. This is the largest amount ever reached by agricultural exports for this or any other country, and exceeded by $24,000,000 the extraordinary value of 1901, which had previously been the record year.

Principal among the items that make the increase over the fiscal year 1905 are grain and its products, chiefly wheat and flour, for which the gain was $79,000,000; packing-house products, for which the gain was over $37,000,000; cotton, $19,600,000; various seeds, $6,355,000; dairy products, $3,900,000; and live animals, $2,400,000. Products exhibiting a decrease were mostly inconsiderable. In hops, the decline was $1,355,000; tobacco, $992,000; vegetable oils, $726,000; fruits, $440,000.

Cotton maintains its long lead over other chief exports, with a value of $401,000,000 for 3,634,000,000 pounds, so that the latest year was exceeded only by 1898, 1899, and 1905 in quantity exported; but in value of exported cotton the figures for 1906 are $19,600,000 higher than for 1905, which was previously the record year, and $29,000,000 higher than for 1904, which was third in order in the value of these exports.

In his report for 1905 the secretary said:

Every sunset during the past five years has registered an increase of $3,400,000 in the value of the farms of this country; every month has piled this value upon value until it has reached $102,000,000; that portion of the national debt bearing interest is equaled by the increased value of farms in nine months, and this increase for a little over a year balances the entire interest- and non-interest-bearing debt of the United States.

Nevertheless, the problem remains. Mr. James J. Hill, president of the Northern Pacific and Great Northern Railroads, said in an address delivered at the Minnesota State Fair at St. Paul, 1906:

James J. Hill

There must be a national revolt against the worship of manufacture and trade as the only forms of progressive activity and the false notion that wealth built upon these at the sacrifice of the fundamental form of wealth production can endure. The first requisite is a clear recognition on the part of the whole people, from the highest down to the lowest, that the tillage of the soil is the natural and most desirable occupation for man, to which every other is subsidiary and to which all else must in the end yield. . . . Within forty-four years we shall have to meet the wants of more than 200,000,000 people. In less than twenty years from this moment the United States will have 130,000,000 people. Where are these people, not of some dim, distant age, but of this very generation now growing to manhood, to be employed and how supported? When the search-light is thus suddenly turned on we recognize not a mere speculation, but the grim face of that specter which confronts the unemployed, tramping hateful streets in hope of food and shelter. . . .

In the year 1950, so far as our own resources are concerned, we will approach an ironless age. For a population of 200,000,000 people our home supply of iron will have retreated almost to the company of the precious metals. There is no substitute whose production and preparation for practical use is not far more expensive. Not merely our manufacturing industries, but our whole complex industrial life, so intimately built upon cheap iron and coal, will feel the strain and must suffer realinement. The peril is not one of remote geologic time, but of this generation. And where is there a sign of preparation for it? . . . Only one half of the land in private ownership is now tilled. That tillage does not produce one half of what the land might be made to yield, without losing an atom of its fertility. Yet the waste of our treasure has proceeded so far that the actual value of the soil for productive purposes has already deteriorated more than it should have done in five centuries of use. There is, except in isolated and individual cases, little approaching intensive agriculture in the United States. There are only the annual skimming of the rich cream, the exhaustion of virgin fertility, the extraction from the earth by the most rapid process of its productive powers, the deterioration of life's sole maintenance. And all this with that army of another hundred million people marching in plain sight toward us, and expecting and demanding that they shall be fed. . . .

Every farm properly cared for should be worth more money for each year of its life. The increase of population and demand, the growth of the cities and markets, and the development of diversified farming with density of settlement should assure a large increment. Even where large quantities of new and fertile land are opened, these influences, together with the lowest cost of transportation in the world, should make the growth of values steady.

Within the twenty years between 1880 and 1900 the aggregate value of farm lands and improvements, including buildings, declined in every one of the New England and Middle States, except Massachusetts alone. The total decrease in value for these ten states of the first asset of a civilized people is more than $300,000,000. Nor is the attempted explanation by the Census Bureau of this shrinkage either adequate or convincing. Even the great and fertile State of Ohio, in the Middle West, showed a decline of more than $60,000,000. On the new lands of the West, where once the wheat yield was from twenty to thirty bushels an acre, it is now from twelve to eighteen. . . .

In manufactures we have come to consider small economies so carefully that the difference of a fraction of a cent, the utilization of a by-product of something formerly consigned to the scrap heap, makes the difference between profit and bankruptcy. In farming we are satisfied with a small yield at the expense of the most rapid soil deterioration. We are satisfied with a national average annual product of $11.38 per acre, at the cost of diminishing annual return from the same fields, when we might just as well secure from two to three times that sum. . . . If a process for extracting metallic wealth from rocks were to be discovered to-morrow,

such as to assure the country an added volume of $1,000,000,000 in wealth every year, the nation would talk of nothing else. Yet these things would be but a trifle when compared with the possibilities of agricultural development in the United States.

The government should establish a small model farm on its own land in every rural congressional district, later perhaps in every county in the agricultural states. The new crusade should be proclaimed everywhere, from the executive chamber, from the editorial office, from the platform, and above all from every college class room and from every little schoolhouse in the land.

Agricultural Decline in Great Britain

In Great Britain the problem confronting agriculture is at least as serious as it is in the U. S., and more acute. Says Mr. E. A. Pratt ("The Transition in Agriculture," 1906): "The opening up of vast expanses of virgin soils in the U. S., Canada, Argentina, Australasia, and elsewhere, to the production of wheat on a scale to which there could be no possible approach in the United Kingdom; the quick transport of these and other foreign or colonial supplies by ocean steamers at rates which were so low that they became almost a negligible quantity; the invention of refrigerating processes which nullified climate, as steam had already annihilated distance, and opened up British markets to the almost limitless supplies of meat, butter, and other perishables from distant lands; the steady fall in the price of wool, owing to the magnitude of the flocks raised in our colonies—these and other causes, apart from the advent of a succession of unfavorable seasons, were sufficient in themselves to disturb the very foundations of British agriculture, and to show that the old order of things in regard thereto was passing away."

A report of the Agricultural Committee of the Fabian Society (July, 1905) comments as follows:

The decline of agriculture in Great Britain began about thirty years ago. The bad harvests of 1876–82 caused widespread ruin, while in the same period the introduction of very cheap ocean transport and the extension of agriculture in America and elsewhere led to a tremendous fall in prices. According to the Board of Trade figures, the fall in 1898–1902, compared with 1871–75, has been 37.7 per cent in corn, and 18.1 per cent in meat, bacon, and dairy produce. The effect on incomes derived from land has been catastrophic. The landlord's share, the gross annual value of lands assessed to income tax under Schedule A (including tithe rent charge, ornamental gardens, gardens exceeding one acre, farmhouses and buildings, etc.) fell in Great Britain from £59,568,253 in 1879–80 to £42,507,895 in 1902–3. The average reduction in rent has thus been 28.5 per cent, but in some localities the fall has been as much as 60 per cent. The fall in the value of the fee simple is about the same, and small and encumbered owners have suffered most. Farmers' capital was largely swept away in the early years of the decline, and even now they have to live close and can save but little. The estimated amount of farmers' profits fell in Great Britain from £28,405,086 in 1879–80 to £14,288,974 in 1902–3, or one half. Agricultural laborers alone have gained during the last thirty years; but altho the average weekly earnings in England are now 18*s.* 3*d.*, there is, according to the estimates made by Mr. Wilson Fox, of the Labor Department of the Board of Trade, "a deficit of 2*s.* 0½*d.*, if the value of food, the cost of rent, firing, light, clothes, and club is compared with the earnings of the head of the family (without allowing for any expenditure on beer, tobacco, and household requisites)." The balance must be made good from the earnings of wife and children, from the garden, the poultry, or the pig.

Between 1871 and 1904 arable land in Great Britain has decreased by 3,122,000 acres, and permanent pasture has increased 4,668,000 acres. There has been a great change from corn-raising to cattle-rearing and dairy-farming, with less employment of labor. Simultaneously imports have increased enormously, not only in grain and meat, but also in dairy produce, eggs, poultry, etc., where we might have hoped to hold our own.

The landlord system must bear a large share of the blame for the decay of agriculture. The bad times found many landlords with burdened estates and no reserve, saved in prosperous times, wherewith to keep their property in a state of efficiency. Placed in the position of the social and economic leaders of the rural districts, they have, as a class, largely devoted themselves to drawing their rents and trying to escape public burdens. They have not compelled their tenants to be good farmers; in fact, by obstructive rules and by annual tenancies, they have often prevented improvements. They have not stood between the agricultural laborers and their employers; on the contrary, by neglecting to provide a sufficient supply of sanitary cottages, they have powerfully contributed toward the rural exodus. Locally they have misused their economic strength for political and sectarian ends; while nationally they have set up a false ideal before the nation. To-day they still draw about £43,000,000, or three times the farmers' profits, from the land of Great Britain, with, as the evidence before the Royal Commission on Agriculture showed, disastrous results to the nation. "The evidence goes to show that overrenting (1) has been a chief cause of depression in bringing farmers to ruin, and in deteriorating the condition of the land; (2) is even now very general; and (3) that the opinion that further reductions are necessary and inevitable, is, among farming witnesses, practically universal. . . . There is much evidence to show that reductions are by no means universal, and that, in many districts and on many estates the system of temporary remissions or abatements, sometimes wholly insufficient to meet the times, is still common. In many cases, even in districts where depression is general, there would seem to have been neither reductions nor abatements of any kind." (Royal Commission on Agriculture Minority Report, F. A. Channing, M.P.) The main work of administration is done by a private service of estate agents, bailiffs, and foremen; and the landlord is a mere parasite on the industry of the country.. Farmers, as a body, have shown a great lack of that capacity and adaptability with which men in other occupations have met bad times. They have clung to the old idea that wheat-growing was their only duty, and stubbornly resisted every attempt to persuade or coax them into better business methods. . . .

The Landlord System

Between 1851 and 1901 the number of adult males engaged in agriculture has fallen from 1,904,687 to 988,340, altho one would have expected that the practical elimination of female labor (where there was a fall from 436,174 to 52,459) and the great decline in the employment of males under twenty (from 327,615 to 186,076)—both of these being healthy developments—would have to be compensated by an increase in the number of men.

The weakest point in the present system is the marketing of farm products, and before we can tackle reconstruction, we must find the cause of this weakness. Our butter comes from Denmark, Russia, France, Australia, New Zealand; cheese from Canada, United States, Holland, New Zealand; eggs from Russia, Denmark, Germany, Belgium, France; vegetables from France and Germany.

Small Holdings

Much thought has recently been given to measures that would tend to remedy this state of affairs. There may even be said to be a "new agricultural movement." Efforts have been made to develop small holdings; and to accomplish this was the especial aim of the Small Holdings Act of 1892. By this act county councils were authorized to acquire land, divide it into small holdings of from one to fifty acres, erect buildings thereon, and provide roads, fences, water-supply, and drainage; but the main idea was to sell such holdings, on an instalment system, to the persons wanting them. A council was authorized to let the land only when "of opinion that any persons desirous of themselves cultivating small holdings were unable to buy on the terms fixt by this act, or where the land had been hired by the council on lease or otherwise"; and even then the size of the holding so let must not exceed fifteen acres, or be of a greater annual value than £15. The county councils were also authorized to advance a would-be tenant four fifths of the purchase money on the security of the building. The results thus far have not been large. The procedure has been so costly and complicated, and so hampered by formalities and restrictions of every kind, that County Councils have, as a rule, hesitated to take in hand a great amount of trouble, without any corresponding guaranty of permanent success; and in 1905 a Parliamentary Committee was appointed to inquire into the workings of the act. Too often the small freeholder has had to sink

all his available capital in securing the land, has had to satisfy many legal demands, has consequently found himself encumbered with the burden of a heavy mortgage. The report of the committee mentioned above calls the act "a complete failure."

More has been accomplished by agricultural cooperation. An AGRICULTURAL ORGANIZATION SOCIETY was established in 1901, and five years later it had 140 other societies affiliated with it. The Fabian report calls cooperation the "secret of success." It says:

Cooperation

Cheap railway transport and better conditions of sale can be obtained if the farmers will combine. What has hitherto been lacking is the desire for combination, tho in a few localities that defect is being slowly overcome. What characterizes the agriculture of the Continent is the prevalence of combination. Alike in Denmark, Germany, France, Italy, Holland, Belgium, Switzerland, Hungary, Finland, Poland, Servia, we find a network of cooperative societies all over the country—societies for the cooperative purchase of seeds, manures, implements and machinery, cooperative creameries for the production of butter and cheese, egg-collecting societies, societies for the sale of fruit or grain, export societies, mutual insurance societies, and so on. This voluntary cooperative movement is generally fostered by the State, and has received much aid from landlords and religious bodies.

E. A. Pratt, in his "The Transition in Agriculture" (1906), argues in favor of allotments to the working classes in the towns, to prepare them to become freeholders; and he instances the successful experience of Aylestone, a suburb of Leicester. He says:

The Aylestone solution of the problem here presented is: The cooperative tenancy, under the most economical conditions, of allotments which will (1) give a factory worker healthy recreation; (2) enable him to supplement wages and decrease household expenses by the production of fruit and vegetables, which will, at the same time, give his family a better food-supply than would otherwise be possible; (3) afford him an opportunity, while still engaged in a factory, of gaining such experience of, and acquiring such taste for, market-gardening work that, when the factory failed him, he would still be able to contribute to the support of his family, if not keep them and himself altogether, by becoming a market-gardener, instead of having to depend on such odd jobs as he might be able to pick up as one of the unemployed.

Another and most important contribution to the means of solving the problem, is the Garden City idea, combining the best in city life with the advantages of the country. (See GARDEN CITY.) Socialists of the Fabian type, as evidenced in the report of their committee, would have a large policy of State intervention and control. Says the report:

The breakdown of private enterprise in agriculture has left us with landlords and farmers impoverished, with agricultural laborers earning less than, or just over, subsistence wages. Much capital has been lost, the agricultural population has declined to a dangerous degree. There is no organization for the supply of our growing town markets, everywhere is chaos, while the foreign producer every day gains ground by superior organization. It is necessary for the State to interfere, partly to secure the better utilization of our national resources, partly to increase our agricultural population. We must look forward to five and twenty years of resolute effort; prosperity cannot be restored in a day. The class most needing protection, the laborers, must be dealt with first, in order to raise them to a decent level of comfort. A living-wage must be secured to them and, as a consequence, the farmers' rents must be fixt at a fair level. An Agricultural Court must be set up in each county to regulate wages and fix rents. Continental success in agriculture depends on cooperation, and that in turn is associated with the peasant proprietor system. That system for sundry reasons cannot be adopted here, but its advantages can be obtained through security of tenure. The small farm system should, therefore, form the basis of our reconstruction, free play being left for a graded system of farms where possible. In each county an Agricultural Committee should have compulsory power to acquire land and let it out to tenants, chiefly small holders. It should have power to advance capital to individuals on the collective guaranty of its tenants, and it should be its duty to organize the collection of farm produce and its disposal in the market.

Meanwhile there is progress. A Board of Agriculture for Great Britain was established by Parliament in 1889; and was constituted in 1903 as a Board of Agriculture and Fisheries. It has divisions on animals, intelligence, land, and fisheries. In Ireland a Department of Agriculture and Technical Institution was created in 1899. (See IRELAND.) Agricultural education has also been much advanced. Some eighteen institutions may now be classed as AGRICULTURAL COLLEGES. The Rothamsted Experimental Station, and numerous local societies contribute to the advance. Wise effort in certain directions and in certain quarters has produced satisfactory results. The breeding of high-class live-stock of all types has undergone great expansion, partly in order to provide good dairy cattle and the best qualities of meat, and partly as a separate commercial enterprise, to supply the requirements of countries which have looked to Great Britain as the land whence the best of breeding-stock could be obtained. The production of fruit in Great Britain is said to have doubled during the last thirty years. Flour production is likewise largely increased. Market-gardening, potato-raising, and vegetable-raising have also grown. It is along such subsidiary lines that many people believe that England's agricultural future will develop.

Progress

Ever since the time of Young, the agricultural system of France has been the classic form of small proprietorship. Nearly half the people are engaged in agricultural pursuits; but one generation having succeeded another, and the individual plots of land having been still further divided, the *morcellement* has gone so far that some of the holdings are of the most diminutive proportions. Again, a property of twenty or twenty-five acres may be represented by thirty, forty, or fifty small patches and parcels of land scattered over an entire commune. The caring for such minute parcels of land involves an amount of labor akin to slavery. In his "Relèvement de l'Agriculture," Lafargue wrote:

France

The condition of agriculture brought about by our subdivision of land, and the distance from each other of the morsels belonging to one owner, condemn a man to work such as animals and machines ought to execute, and not only reduce him to the level of a beast, but curse the soil with sterility.

Léonce de Lavergne says in "L'Économie Rurale de l'Angleterre, d'Écosse et de l'Irlande":

Altho the French laborer is frequently proprietor of the land, and thus adds a little profit to his wages, he does not live as well as the English farm-laborer. He is not so well fed, not so well clothed, and is less comfortably lodged. He eats more bread, but it is generally made of rye with the addition of maize, buckwheat, and even chestnuts. . . . He rarely eats meat. I am acquainted with parts of France where people live on seventy centimes (fourteen cents) a day.

Mr. Pratt, in his "The Transition in Agriculture," speaks of these conditions as follows:

Nor have the results of peasant proprietorship in France been more satisfactory from a financial standpoint. "Proprietors" they may be in name, but few of the peasants hold their land free of mortgage and many of them are heavily indebted besides. They not only cultivate the soil under the most laborious of conditions, but they must meet, as best they can, the demands of the State, the usury of the money-lender, and also the fees of the lawyer who fattens alike on the land transfers and on the quarrels and lawsuits. "Of the 8,000,000 proprietors in France," wrote M. Lecouteux, when professor of rural economy at the Institute, "3,000,000

are on the pauper roll, exempt, that is, from personal taxation"; while of the remainder, at the period of which this authority speaks, 600,000 proprietors paid contributions to the State amounting to only five centimes each. "Getting rid of one order of landlords and their rents," adds M. Lecouteux, "they have subjected themselves to another, tho invisible, order—the mortgagees, and to their heavier and more rigid rents."

Nevertheless, there is a brighter side. Agricultural cooperative societies or syndicates have taken a deep hold in France, and are gradually accomplishing many beneficent reforms. France devotes some 5,000,000 acres to the cultivation of the vine, and is in many ways one of the leading agricultural countries of the world.

The system of land tenure and the condition of agricultural population is very different in different portions of the German Empire. Generally, small estates and peasant proprietorship prevail in the West-German states, while large estates prevail in the Northeast. In the Prussian provinces of Pomerania, Posen, and East and West Prussia, estates of 250 acres and more are the rule. In Westphalia and Oldenburg the agricultural laborer rents a small plot of ground from his employer on condition of giving him a certain number of days' work in return for a lower rate of wages than would otherwise be paid in the district. The laborer is a small cultivator on his own account, not as a rule rich enough to possess a team of horses, but allowed the use of his employer's team when necessary, and receiving other assistance in kind. The relations between the two parties are reported to be more favorable than in any other part of Germany. In Southern Germany small holdings prevail, but here the laborer is himself a small freeholder, who ekes out the scanty resources of his own property by performing service for the farmers who have more land than they can cultivate themselves. This becomes the more necessary, because on the death of the small freeholder any land which he has accumulated does not pass intact to his appointed heir, as in Westphalia. It is, as a rule, subdivided among his children, who must recommence the laborious process of saving, if they are ever to be in a position of independence.

Germany

Mid-Germany—i. e., the district between the Weser and Elbe—is the home of the different classes of peasant farmers and of what are known as free laborers. These are drawn from different classes of the village population, possessing larger or smaller plots of land held on different systems of tenure handed down from feudal times, and known as Kötter, Brinksitzer, Häusler, or Anbauer. To the larger farmer (*Bauer*), or to the large landed proprietor (*Gutsbesitzer*), they are all merely day-laborers in the strictest sense of the term.

In the wide expanse of territory east of the Elbe the contract between the agricultural laborer and his employer takes a great variety of forms; but in what Professor Knapp calls the most typical districts, where great estates (*Rittergüter*) are numerous and settlements of peasant farmers (*Bauerndörfer*) few, the most usual form has hitherto been that known as socage tenancy (*Instenwesen*). Here the landowner enters into a contract for a lengthened period, which assures him of the services not of an individual merely, but of a family. The family is settled in a cottage upon the landlord's estate, and must be prepared to provide a man and an assistant—a so-called socager (*Scharwerker*)—to perform the agricultural labor required on the estate. A very small daily wage is paid in return; the socage tenant generally receives a portion of garden-ground for his own use in addition to his house, and a few acres of land are cultivated for him within the estate; whatever these produce, whether corn, other kinds of produce, or potatoes, belongs to the socage tenant (*Inste*). Finally, the socage tenant has a right to thrash his landlord's corn during the winter in return for a certain proportion of the yield. This remuneration in kind is often more than he can use, but he is at liberty to sell it, and the proceeds, together with a very small daily wage, represent the extent of his pecuniary resources. As a rule he owns a cow or a few sheep, and in all cases he keeps one or two pigs. As far as health and good nourishment are concerned, the condition of such a laborer leaves little to be desired, and lately much has been done to remedy the miserable character of the cottages. Germany now produces one third of the world's output of sugar beets, and is the leading potato-producing country. Vineyards along the Rhine sometimes give a net return of $100 per acre.

In Belgium, Holland, and Denmark peasant proprietorship has gone very far, the individual holdings being very small. This very fact has, perhaps, been one of the main factors in promoting cooperation. For details, see those countries.

Agriculture has been called "the backbone of Italy." Very few parts of the civilized world, indeed, have a more distinctly agricultural character than this country, where "the rural laborers may be counted by millions, while the industrial operatives are only numbered by thousands." Great as is the importance of the agricultural question, however, it is extremely difficult to grasp, owing to the extraordinary complexity and variety of the conditions of Italian land tenure. It includes the medieval manor (*latifondo*), cultivated on the most primitive extensive system, the most perfect system of intensive cultivation on a large scale; "petite culture" pushed to the extreme of specialization, and the same methods applied to the most heterogeneous mixture of products; rents varying from 5 lire to 2,000 lire per hectare; peasant proprietorship, "metayer" farming, feudal tenancies, and hired labor. In every separate district the phenomena of rural economy have special, exclusive, characteristic features, arising from an infinite diversity of local circumstances.

Italy

There are three typical forms of agrarian contract in Italy—the "metayer" system (*mezzadria, mezzeria, colonia*), in which the principle of profit-sharing finds its simplest expression; the leasehold system (*affitto*), and the system of home cultivation by means of hired laborers (*salario*). Each of these systems has given rise to innumerable deviations in practise, and each passes by insensible gradations into the other. Many agriculturists cultivate part of their land as metayers, part as leaseholders, and part as the farm servants of a landlord. Agriculture, however, generally is in a very primitive condition. Lombardy is the garden of Italy, with 1,600,000 acres of irrigated land, and its intensive culture. Italy has over half a million people engaged in raising silkworms.

In Switzerland industry and agriculture are very closely connected. "The peasant when unoccupied by his land easily finds some useful employment in a multiplicity of other labors,

varying from tree-felling and wood-carving to the manufacture of watch-springs. The artizan or factory hand is, on the other hand, generally half a peasant, possessing some few square yards of land, with a cow or a few goats."

Switzerland

The Swiss system of land tenure, which is favorable to the formation of small freeholds, also contributes to the prosperity of the agricultural population. By far the greater part of the land is held in farms varying in size from two to five hectares, and in many industrial districts an innumerable quantity of minute holdings are to be found cultivated by members of the working class. The question of rent is an unimportant one in Switzerland, as it is rare to find a farm which is not worked by the owners; but owing to the continual subdivision of property the land is in many cases heavily mortgaged.

The existence of large areas of common land (*Allmend*) in Switzerland is of great benefit to the agricultural classes. These lands are said to be a survival from the times when the whole soil of the country was held by the nation in common. The first departure from this custom was made by the Romans, who granted lands to veteran soldiers; gifts of land to religious foundations—to the Abbey of St. Gall, for example, in the eighth century—did still more to establish the principle of private property; but even as late as the thirteenth and fourteenth centuries by far the greater part of the soil of Switzerland was held in common. In 1803, under the influence of ideas which found expression in the French Revolution, the common lands were to a great extent sold by the communes to private persons. It was believed that private ownership would lead to better cultivation and to the eventual decrease of poverty, but the results showed that in most cantons the step had led to the increase of pauperism. The common lands now existing include (1) gardens, orchards, and vineyards, situated for the most part in valleys or on hillsides; (2) pasture lands both in the lowlands and on mountains; (3) forests, where the inhabitants of the commune have the right of gathering firewood; (4) marshes, ponds, peat bogs, and the shores of lakes.

Where farms are large enough to absorb more labor than the family of the owner can supply, they are cultivated by permanent laborers, who live with their employer and practically form part of his family. These laborers are engaged for long periods, and the best relations exist between them and their employers. Day-laborers, on the other hand, find themselves in a very unstable position, as the demand for extra labor is not continuous, but confined to certain seasons of the year, such as the hay harvest.

Of the remaining countries of Europe, Austria and Russia, which are the most important agriculturally, present sharp contrasts with modern methods on some farms, and most primitive methods generally. For the division of the land, see the article on the respective countries, and for statistics as to crops, see the last division of this article. Spain has few advanced methods, in spite of her extensive cultivation of vines, oranges, and olives. In South America the Argentine Republic is taking a large place in the world's agricultural market with wheat, wool, cattle, and wine. Brazil holds a leading place with coffee. In Mexico the raising of cattle and sheep is the main agricultural interest. For Canadian conditions, see CANADA. In Africa, Egypt under English administration and Fellah labor produces large amounts of sugar and high-grade cotton. China and India, in spite of ancient methods and rude implements, produce important crops by irrigation and garden-like culture. For Australia, see AUSTRALIA.

1901	8,162,660	2,498,851	48,687,261	7,050,153
1902	9,494,150	3,900,396	43,402,393	7,467,250
1903	9,904,493	3,555,064	42,901,530	7,873,385
1904	10,060,762	3,804,828	36,287,192	6,936,003
1905	9,606,827	3,699,882	48,323,353	6,546,502

The hay harvest in 1905 was 26,265,411 tons. There were also produced 487,068 tons of spelt and 2,921,953 tons of barley. The following figures show the proportions between the areas of cultivated land under the different crops in 1905: Rye, 15.6; wheat, 19.2; spelt, 14.6; barley, 17.9; potatoes, 145.7; oats, 15.7; hay, 44.1.

In the entire German Empire there were, in 1900, 52,332,000 apple-trees; 25,116,000 pear-trees; 69,436,000 plum-trees, and 21,548,000 cherry-trees. Total fruit-trees, 168,432,000. In 1905 there were 39,511 hectares of land under hops, the total harvest being 58,513,800 pounds. The wine production in 1905 amounted to 3,855,978 hectoliters (about 102,000,000 gallons), to a total value of 109,000,000 marks. The total area of land under tobacco was, in 1904, 15,883 hectares, yielding 68,761,800 pounds of tobacco.

* Flour included, being converted into grain at the rate of four and a half bushels to the barrel.
† Not including free ports.
‡ Preliminary figures excluding the trade over the Asiatic frontier (excepting the Black Sea ports of the Caucasus).
§ Estimated.

GENERAL NOTE.—It should not be expected that the world's export and import totals for any year will agree. Among sources of disagreement are these: (1) Different periods of time covered in the "year" of the various countries; (2) imports received in year subsequent to year of export; (3) want of uniformity in classification of goods among countries; (4) different practises and varying degrees of failure in recording countries of origin and ultimate destination; (5) different practises of recording re-exported goods; (6) opposite methods of treating free ports; (7) clerical errors, which, it may be assumed, are not infrequent.

The exports given are domestic exports and the imports given are imports for consumption, as far as it is feasible and consistent so to express the facts; no statement is for net exports or net imports. While there are some inevitable omissions from such a table as this, on the other hand, there are some duplications because of reshipments that do not appear as such in official reports.

* Cows.

ALADYIN, ALEXIS: Political leader of the Russian peasant party, "the Group of Toil," in the first Russian Duma. Born in 1873 of extremely poor peasant parents, he worked in the fields and attended local schools till he decided to become a physician, when he worked his way into the University of Kazan. He remained there three years, but was finally expelled because of doubtful propensities and free speech. He went at once to the outskirts of Kazan and labored among the workmen, organizing trade-unions. Arrested in 1895 he was liberated on $500 bail pending the delivery of the verdict; but on learning that he was to be sentenced to four years of solitary confinement and eight of exile in Archangel, he managed to cross the frontier, and lived a precarious life in Brussels, Paris, and London, acquiring many languages and much information. He lectured for a while at Toynbee Hall. Upon the issuance of the manifesto of October, 1905, however, Aladyin returned to Russia via Finland. Taking part in a strike in St. Petersburg, he had to leave and went to Sembersk where he found his family. He was obliged to leave this place, but was, nevertheless, elected by the villagers to the Duma. He immediately formed all the peasant and labor deputies into a party of which he became the effective leader. His economic ideas are those of an opportunist socialism adapted to Russian conditions.

ALASKA: A territory of the United States, bought from Russia in 1867. It has an area of 590,889 sq. m. Of the 368,103,680 acres of land, 367,983 are unappropriated and unreserved. The population in 1900 was 63,592, of whom 30,507 were whites (27,307 males); 29,536 natives (Indians, Eskimos, Aleuts, etc.); 3,116 Chinese. It has probably decreased since then. The town of Nome had 12,468 inhabitants; Skagway, 3,117; Juneau, 1,864; Sitka, the seat of administration, 1,396. Alaska has neither legislature nor constitution, but is governed by Congress and administered by a governor and other officials appointed by the president. There are three judicial districts and three courts. Education is directed by an agent of the U. S. Commissioner of Education. In 1903 there were 47 public schools with 2,108 pupils. Numerous missions carry on educational as well as religious work.

The chief industries are seal and salmon fisheries and mining. The gold produced in 1904 was valued at $9,160,500; the silver at $256,900. Gold is found mainly in southeast Alaska (low grade), at Cape Nome, and on the Yukon River. The seal fisheries of the Pribilof or Seal Islands are leased to an American company under restrictions. The number of skins shipped from these islands in 1904 was 14,368. Besides this there is pelagic seal-hunting off the northwest coast and in the Bering Strait by Canadians and Indians who caught 12,791 seals in 1903. But this industry is in danger of being exhausted. The annual catch of the salmon fisheries is valued at over $8,000,000. There are thirty companies with thirty-five canning and twelve salting plants. Agriculture is possible in some parts of the territory during the brief summer, but is little developed. The U. S. government has made some experiments along that line. The exports to the U. S. in 1904 (besides gold) were valued at $10,698,694, and to Canada $1,001,990. The imports from the U. S. amounted to $11,227,698, and from Canada $1,034,401. There is a railway from Skagway (near Sitka) toward the Yukon, of a total length of 112 miles. There are seventy-five post-offices, and telegraphic connection with the U. S. and Canada. Labor conditions are so uncertain as to render it impossible to state them briefly. There has been "claim jumping" and trouble over mining-laws.

ALBRECHT: An early communist and so-called "prophet," who, with WEITLING, spread through Germany the gospel of communism. On account of his utterances he was put in prison for six years, where his only reading was the Bible; but in 1841 he escaped to Switzerland. Thenceforward he devoted himself to preaching, often in Old Testament prophetic language, the gospel of Bible communism. He wrote numerous tracts, among others: "Die Wiederherstellung des Reiches Zion" ("The Restoration of the Kingdom of Zion"); "Das baldige Wiedersehen am Alter der Freiheit"; "Herausforderung der Priesterwelt," etc.

ALBRECHT, THEODOR C.: German privy councilor; chief of the Imperial Geodetic Institute; born in Dresden, Aug. 30, 1843; studied at the technical high school of Dresden, and at the universities of Berlin and Leipsic (Ph.D., 1868). In 1875 he received the title of professor, and in 1898 was appointed privy councilor. He is an authority on housing, settlements, and kindred questions in Germany, and is the author of various scientific works. *Address:* Burggrafenstrasse 25, Potsdam, Germany.

ALCOHOL: See LIQUOR, CONSUMPTION OF.

ALDEN, PERCY: British social reformer, author, and Member of Parliament; born in Oxford, 1865; educated at Baliol College, Oxford. He was warden of the Mansfield House University Settlement from 1891 to 1901, being elected honorary warden upon his retirement. From 1892 to 1901 he was councilor of the borough of West Ham, and in 1898 officiated as deputy mayor. Mr. Alden has lectured on social and labor problems in the United States, New Zealand, and Australia. He was cooptated a member of the London School Board in 1903; and he is a member also of the Fabian Society. In 1906 he was elected to Parliament as a "Liberal," tho in favor of most of the measures adopted by labor and evolutionary socialists; and he is prepared to work with any man proceeding in the right direction. The social problem has become the deep abiding interest in his life. Author of "The Unemployed: A National Question." *Address:* 1 Woburn Square, W. C. London, England.

ALLAN, WILLIAM: Labor organizer; born in Ulster, Ireland, 1813. His father removing to Glasgow, William became a piecer in a cotton factory there, and later was apprenticed to an engineering firm in that city. In 1835 he began working as a journeyman engineer at Liverpool. He became the general secretary of his union in 1847, and retained this office even after the society was merged in the Amalgamated Society of Engineers, being reelected annually for more than twenty years. William Allan was the originator of the "new unionism" of his time. Remarkable for executive ability, he built up, out of the fragments of organization in the engineering trade, a great national society. He died in 1874.

ALLEMANE, JEAN: French Socialist; compositor; founder of the Cooperative Printing Association; editor of *Le Parti Ouvrier*; born 1843. He was arrested as a communist in 1871 and suffered penal imprisonment eight and one half years, being released by amnesty in 1880. He has been an active Socialist leader ever since.

ALLEN, CHARLES GRANT BLAIRFINDIE: Novelist; born in Kingston, Canada, 1848; was graduated from Merton College, Oxford; taught in Jamaica. He was the author of popular scientific works on evolution. His first novel was "Philistia" (1884). Allen became a Socialist, and introduced many radical views into his novels: "The Woman Who Did" (1895), and "A Bride from the Desert" (1896). He died in London in 1899.

ALMSHOUSES: See Poorhouses.

ALTGELD, JOHN P.: Governor of Illinois; born in Prussia, 1848, but early emigrated to the United States with his parents, who settled on a farm near Mansfield, O. He attended the district school, but at the age of sixteen enlisted and participated in the closing campaign of the Civil War. The next few years he spent in teaching, studying, and working as a farm-hand. He read law in St. Louis and then opened an office in Savannah, Mo. In 1874 he was elected prosecuting attorney of Andrew County, but in October, 1875, he removed to Chicago. In 1884 he ran for Congress on the Democratic ticket, but was defeated. In 1886 he was nominated for Superior Judge of Cook County, which at that time gave a Republican majority of about 12,000, and was elected by a large majority, the laboring men being especially active in his interests. He was on the bench nearly five years, being Chief Justice of the Superior Court for one year. A multiplicity of private interests compelled him to resign this position in August, 1891. He became wealthy principally by the buying and selling of real estate in Chicago and investments in street-railways. He designed and built a number of the finest business blocks in Chicago. He was nominated for Governor of Illinois in the Democratic Convention of 1892, and was triumphantly elected, to the surprize of even his own party. For over thirty years Illinois had been considered safe for a Republican plurality of 25,000 to 50,000.

Altgeld gained the hostility of many of the wealthy classes through his pardoning, on June, 1893, of the so-called Chicago Anarchists. Whether right or wrong, there was no question among those who knew him that Governor Altgeld acted from conscientious principles and contrary to his political interests. In the great Pullman strike of 1894 he publicly addrest President Cleveland, protesting against the sending of United States troops to keep the peace in Illinois when not requested to do so by the Governor, he believing that Illinois was abundantly able to protect her own citizens, and asserting that such action on the part of the Federal Government overrode the Constitution, and set up what might easily lead to a military absolutism. In politics a Democrat, Altgeld became in his views increasingly radical, and he took active part in various radical political movements. He died March 12, 1902.

ALTRUISM: A term used in sociology and philosophy to denote the benevolent instincts and emotions in general, or action prompted by them; and more specifically used of that theory of life which would make the living for others the central thought of life and the essence of religion. It was first employed by Comte, but has passed into general use. Herbert Spencer says: "If we define *altruism* as being all action, which, in the normal course of things, benefits others instead of benefiting self, then from the dawn of life altruism has been no less essential than egoism." (See Individualism; Socialism.)

ALTRUIST COMMUNITY: A small attempt at community life, with office in St. Louis, Mo. It was first organized in 1868 in Jasper County, Mo., with ten members. Unable to meet its payments for land, it has made various other attempts, and now owns eight and a half acres near Sulphur Springs, and is engaging in the poultry and gardening business. It has also a headquarters in St. Louis, where it publishes a monthly, *The Altruist*, and a book of 424 pages containing a full explanation of its principles and organization. From the beginning Mr. A. Longley has been the organizer and head. *Address:* 2711 Franklin Avenue, St. Louis, Mo.

AMALGAMATED ASSOCIATION OF IRON, STEEL, AND TIN WORKERS, THE: An important trade-union of the United States; organized in Pittsburg, 1878, by the amalgamation of the United Sons of Vulcan (organized 1858), the Associated Brotherhood of Iron and Steel Heaters, Rollers, and Roughers of the United States (organized 1872), and the Iron and Steel Roll Hands Union (organized 1873). Joseph Bishop was the first president of the association, but John Jarrett, who was elected in 1880 and served till 1883, was largely instrumental in shaping it. In 1881 the association took a prominent part in the formation of the American Federation of Labor; but in the following year it left the latter because of the dropping by the federation of its plank favoring protection. The association has always been a fighting organization and has had numerous strikes, notably the great Homestead Strike. The association has opposed arbitration by third parties, but has been a leader in developing a sliding scale and other agreements with employers. The first sliding scale in the United States was formed by conference between the employers and the United Sons of Vulcan in 1865; and wage agreements with employers have been characteristic of the association; tho it has also had, mainly at the times of renewal of agreements, severe industrial struggles, strikes, and lockouts. At the annual meetings the president generally appoints a committee of forty members which meet the committees of manufacturers in conjunction with whom it fixes the rate of wages. The average monthly membership of the association in 1905 was reported as about 10,000.

AMANA COMMUNITY: A German religious community in Iowa, reached at the station of Homestead, on the Chicago and Rock Island Railroad. The community numbers some 1,800 souls, owns about 25,000 acres, is rated at over $1,000,000 in capital, and is in every way an

economic and industrial success. Mainly agricultural, it has herds of blooded cattle, sheep, hogs, and a large number of fine horses. It also does a growing manufacturing business. The two largest woolen mills in Iowa are owned and operated by the community. The famous colony blue prints are made here; 80 pieces of these, containing 45 yards each, are turned out in a day. The community has, moreover, two large flouring mills, with full roller process and elevators, manufacturing pearl barley and hominy. There are three machine-shops where the machinery used by the community is repaired. Besides these there are dye-shops, blacksmith shops, sawmills, a printing-office, and other lesser industries. Their business is growing, because their patrons are well treated. Their goods are honest goods, the Amana brand telling its own story.

Organization

The community lives in eight villages, two or three miles apart, Amana being the center, and Homestead the most important railroad office. Each village has its own doctor, school, post-office, store, hotel, and place of meeting. The government of the community is vested in a president—now Dr. Jacob Winzenried—and a board of thirteen directors, elected annually by the community. Family life is preserved inviolate, each family living alone, except where two or three prefer to live in the same house. They come together, however, for common meals in little boarding-houses, one for every thirty to forty persons. The fare is simple, but abundant and healthy. The houses are pleasant and homelike, tho unpainted, being covered in summer with vines and surrounded bylittle flower gardens. The communism is absolute, all the necessities of life being provided freely for all, and the industries being operated for the equal advantage of all. The life is simple and quiet, there being few amusements and little variety; national holidays and memorial days, however, are observed. The community is very religious. A prayer-meeting is held in each village every night of the week, where the men sit on one side and the women on the other, and quietly sing their German Lutheran chants, or pray, or read from the Bible or the books of their prophets or leaders. They call their communities True Inspiration Congregations, and believe in the Trinity, justification by faith, the resurrection of the dead, the gradual purification of the impenitent by fire, the communism of all saints as a necessary part of Christianity. They believe that an era of inspiration began in the eighteenth century, the Holy Ghost speaking to their founder, Erasmus Gruber, and other "prophets." They drink wine made by their own labor, formerly brewing the best beer of the state, and deriving quite a profit from this, which practise, however, they quietly ended when Iowa became a prohibition state, doing this out of respect to the law and the opinions of their neighbors. Wine, however, they give to their employees in harvest time as freely and generously as to themselves. The life being so simple and quiet, and without great educational advantages, many of the young people leave, and are allowed to do so, but often are glad to come back to the peace and quiet plenty of the communal home. They do not seek new members, but elect to membership those who come and after trial prove themselves of the right spirit. The universal language is German. The beginning of the sect was in Würtemberg, Germany, where it was founded in 1714 by Erasmus Gruber. Later Christian Metz became their leader, and he brought them to the United States in 1843. First settling in Ebenezer, Erie County, N. Y., they moved to their present site in 1855–64.

AMENDMENTS TO THE CONSTITUTION: See Constitution.

AMERICA: See United States, etc.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE, THE: An academy organized in Philadelphia, Dec. 14, 1889, with the object of furnishing a platform for the discussion of the various problems of modern life, paying particular attention to those which were not adequately represented in the work of other learned societies. The academy holds four scientific sessions each year, in addition to the annual meeting of two days' duration, which is held in April. The proceedings of the academy are published in the form of a bi-monthly periodical called *The Annals of the American Academy of Political and Social Science*.

In earlier years the numbers of *The Annals* contained papers upon many topics, but more recently the policy has been to devote each number to some special topic. Recent issues have been devoted to such subjects as City Life and Progress, Child Labor, Philanthropy and Penology, Insurance and Commercial Organization, and Business Management and Finance. From time to time monographs on special topics have been published as supplements. Among these may be mentioned "Housing Conditions in Jersey City," by Miss Mary B. Sayles. Bound copies of the various numbers are sold at $1.25 each.

Any person interested in the general purposes of the academy may become a member, if approved by the council, by paying the annual membership fee of $5.00 or a life fee of $100.00. Life members are exempt from annual fees. Members receive all the publications of the academy and are entitled to submit papers and communications and to attend and participate in all scientific meetings. The members (1906) number 3,713, of whom 116 are life members. The list embraces a large number of the prominent thinkers and writers on political, economic, and social topics in America, with an increasing representation from Mexico, South America, and Europe.

During the last sixteen years more than 500 of the more important articles appearing in *The Annals* have been reprinted and sold at low price. Among these may be mentioned: "The Development of Park Systems in American Cities," by Andrew W. Crawford; "Principles of Reform and Penal Law," by Charlton T. Lewis; "Recent Tendencies in American Legislation," by Samuel J. Barrows; "Supervision of Charities in New York," by Robert W. Hebberd; "World Currents in Charity, Theory and Practice," by Charles R. Henderson; and "The Theory of Social Forces," by Prof. S. N. Patten.

All meetings of the academy are held in Philadelphia, and the active executive officers are largely connected with the University of Pennsylvania. Secretary, Carl Kelsey, University of Pennsylvania, Philadelphia, Pa.

AMERICAN ASSOCIATION FOR LABOR LEGISLATION, THE: Formed 1906. Objects: (1) To serve as the American branch of the International Association for Labor Legislation (q. v.); (2) to promote the uniformity of labor legislation in the United States; (3) to encourage the study of labor legislation.

Dues: $1.00 annually; $3.00, including receipt of the monthly bulletin of the international association. President, Prof. R. T. Ely, University of Wisconsin. Secretary, A. F. Weber, New York

State Department of Labor, Albany, N. Y. Executive Committee, president, and secretary, *ex-officio*: A. J. Boulton, H. W. Farnam, C. P. Neill, H. R. Seager, and C. R. Woodruff.

AMERICAN CIVIC ASSOCIATION, THE: Formed June 10, 1904, by the amalgamation of the American Park and Outdoor Art Association and the American League for Civic Improvement. Object: civic improvement. It represents cooperation on a national scale for the promotion of a more beautiful America in every city, village, and hamlet in the country. It serves as a clearing-house for improvement work, bringing the local workers into helpful contact with one another and placing the experience of all at the command of each. Members, 2,200. Annual meeting, October. Reports and pamphlets. Annual subscription, $3.00. President, J. Horace McFarland, Harrisburg, Pa.; secretary, Clinton Rogers Woodruff, 703 North American Building, Philadelphia, Pa.

AMERICAN ECONOMIC ASSOCIATION, THE: Founded in 1885 "for the encouragement of economic research . . . and of perfect freedom of discussion." It has no creed. Persons of all shades of economic opinion are found among its 1,000 members, and widely different views are given a hearing at its annual meetings and in its publications.

Every member receives all current reports and publications of the association. The publications, begun in 1886, contain nearly a hundred of the most important economic monographs that have been published by American students, besides a large number of papers and discussions by leading experts in practical and in academic life. A list of doctoral dissertations in progress in American universities is now annually prepared by the Publication Committee. Annual dues, $3.00. President, Prof. Jeremiah W. Jenks, of Cornell University. Secretary, Prof. W. M. Daniels, Princeton, N. J.

AMERICAN FEDERATION OF LABOR, THE: Organized (in its present form), 1886. Prior to the Civil War, and even till 1881, national trade-unions in the United States multiplied without any corresponding success in the formation of enduring alliances.

Labor federations, in so far as they existed, were local in character. Thus, the General Trades Union of the City of New York, active in the labor field as early as 1833, was a federation composed of twenty-one trade societies of that city. The General Trades Union of Boston was organized in 1834 upon the same general lines. A constitution adopted at the convention was later ratified by the sixteen local unions in the federation. Similar unions were formed in other cities, notably Baltimore and Philadelphia. The Industrial Congress of the United States, which met in New York, Oct. 12, 1845, represents a nearer approach to a national federation of labor. The convention was called together mainly through the efforts of the New England Workingmen's League and the National Reform Association of New York, elected officers, and adopted a declaration of principles. The second Industrial Congress, which met in New York, June 10, 1847, included representatives from the states of New York, Massachusetts, Pennsylvania, Delaware, Illinois, and Kentucky.

Early History

Little was attempted and less achieved in labor federation on a national scale between 1850 and 1864; but as soon as the Civil War had closed, interest in this direction rapidly developed. The twelfth annual session of the National Typographical Union in 1864 adopted a resolution instructing the delegates present to recommend to the local unions of the cities and towns the formation of central federations "for the mutual protection and support of the workingmen of all trades." In 1865 twelve men, independently of any trade-unions to which they belonged, met in Louisville for the purpose of discussing plans to further the interests of the labor movement, and issued a call for a general convention to be held in Baltimore the following year.

On the 26th of March, 1866, the presidents of various national trade-unions met in New York City and decided to hold a national convention in Baltimore during the month of August. This was supplemented a little later by a call address to the workingmen of the United States in the interest of the eight-hour working-day. All trade-unions were invited to participate in the coming convention, with representation upon the basis of two delegates for each trades assembly and one for every local organization.

On Aug. 20, 1866, the National Labor Union, the name given to the new organization, met in Baltimore, elected a full set of officers, and adjourned without adopting a formal platform or making any provision for raising revenue.

The National Labor Union reassembled in 1867 at Chicago, and again in 1868 at New York, displaying considerable vigor in agitating the national eight-hour law. Other important questions discust in the different conventions were labor leagues, apprentices, cooperation, convict labor, public lands, taxing bonds, national banks, money, and political organization. Altho conventions were held in 1869, 1870, and 1871, the membership steadily dwindled until in 1872 a final effort to revive interest resulted in the nomination of an independent candidate for President of the United States. Active participation in the national campaign of that year created internal dissensions which hastened the downfall of the organization.

In response to a call sent out in 1881, delegates from various trade and labor organizations met in Pittsburg, Nov. 15, 1881, and formed the Federation of Organized Trades and Labor Unions, with John Jarrett, president of the Amalgamated Association of Iron and Steel Workers, as temporary chairman. The platform of the federation set forth the objects of the organization as follows: The passage of laws in state legislatures and in Congress for the incorporation of trade-unions and similar labor organizations; compulsory education of children; prohibition of children from working under the age of fourteen; uniform apprentice laws; an effective national eight-hour law; restriction of the "order" or "truck" system; a mechanics' lien law; repeal of all conspiracy laws against organized labor; a bureau of labor statistics; protection to American industry; a law to prevent the importation of foreign laborers under contract; and proper representation of all trades and labor organizations in law-making bodies.

A National Federation

For several years after 1881 the history of the general federation movement in the United States centers largely in the struggle between the Knights of Labor and the trade and labor unions, turning mainly on the question of the autonomy of each trade. Keen rivalry developed. The most prominent leaders of the two parties were Mr. Powderly, Grand Master Workman of the Knights of Labor, and Mr. George E. McNeill. That a feeling of antagonism was present from the beginning is suggested by a communication issued by the federation to the trade-unions. In this address the federation declared: "Open trade-unions, national and international, can and ought to work side by side with the Knights of Labor, and this would be the case were it not for men either overzealous or ambitious who busy themselves in attempting the destruction of existing unions to serve their own whims." *The Cigar-Makers' Journal* referred to the federation movement of 1881–82 as in "a chaotic state pulled and dragged in all directions. Some advise us," the article continues, "to adopt new systems of organizations defying practical experience and common sense. If the representatives of the bona-fide trade-unions, not of so-called labor clubs, are true to their mission, they will make a bold stand against all inferior systems of organization."

Struggle with Knights of Labor

The year 1886 marks an important period in the history of labor federation. Not only did the Knights of Labor in that year reach their greatest numerical strength, but at the same time the movement toward the national federation

of trades gained new vigor in the transition of the Federation of Organized Trades and Labor Unions into the American Federation of Labor. The Federation of Trades and Labor Unions as then constituted did not satisfy the more energetic and ambitious among the labor leaders of the time, who were desirous of reaching some agreement with the Knights of Labor whereby the friction between that organization and the trade-unions should cease. In response to a call issued by P. J. McGuire (general secretary of the Brotherhood of Carpenters and Joiners), A. Strasser (president of the Cigar Makers' Union), P. J. Fitzpatrick (president of the Iron Molders' International Union), Josiah Deyer (secretary of the Granite Cutters' International Union), and W. H. Foster (secretary of the Federation of Trades and Labor Unions), a trade-unions' conference met in Philadelphia on May 17, 1886, and agreed upon certain proposals to be submitted to the special session of the General Assembly of the Knights of Labor soon to be held at Cleveland, O. Contrary to the wishes of the trade-unionists, no definite action on "the treaty" was taken at the meeting of the General Assembly, and a further effort to arrive at a permanent understanding with the Knights of Labor was made later in the year.

When the General Assembly of the Knights of Labor assembled at Richmond in October, 1886, the trade-union officials offered a further protest against the attitude of the Knights toward the unions, and asked for some assurance that the trade-unions thereafter would not be interfered with by the organizers of the order. The response of the General Assembly was to adopt a resolution compelling all employees in the cigar trade, who were members of both the Knights of Labor and the Cigar Makers' International Union, to withdraw from the union or leave the order, and adjourned without making further advances toward a peaceful settlement of the difficulties.

Throughout this controversy between the Knights and the trade-unions, the Federation of Trades had exerted its influence steadily in favor of the latter. Accordingly, when the representatives of various trade-unions arranged to meet in Columbus, O., the first week in December, 1886, the legislative committee of the federation decided to hold its annual convention at the same time and place for the purpose of cooperating with the conference of the trade-union officials.

The two conventions met on Dec. 7th and 8th, respectively, and the members of the Federation of Trades and Labor Unions attended the sessions of the trade-union conference in a body. On the third day of the conference, the committee of the whole reported to the federation that its committee had attended the conference and that all the delegates had been admitted as members thereof. The legislative committee also reported that the trade-union conference had formed a new organization known as the American Federation of Labor, with a constitution designed to protect the interests of trade-unions. It was agreed that all moneys, papers, and effects of the old federation should be turned over to the officers of the new organization, and that all per capita tax due the old federation should be collected by the new federation. From this time the Knights of Labor steadily declined in membership and power while the American Federation advanced with rapid strides. At the present time (1907) the Knights play an inconsiderable part in the labor movement, while the American Federation is steadily gaining in influence. The conventions of 1886, 1887, and 1888 were called respectively the first, second, and third convention of the American Federation; but by order of the convention of 1889 the origin of the federation in all official documents is dated from 1881.

Final Organization

The American Federation of Labor, upholding the principle of trade autonomy, favors the local trade-union composed of members following a single vocation, and attached to a national trade-union. Where the local union is not affiliated with a national organization, it receives a charter directly from the American Federation and becomes known, for instance, as "Ship Carpenters' Union, No. 6,976." On the other hand, the organizers of the federation often find it necessary to form into one local union workers of miscellaneous crafts. Hence federal labor-unions exist in those localities where separate trade-unions are impracticable. As soon as a sufficient number of a craft is admitted, a new local trade-union, recruited from the membership of the mixed union, is formed. This trade "local" in turn joins the national union of its craft wherever possible. According to the report for November 1906, there were 27,500 local unions and 759 local trade- and federal labor-unions directly affiliated with the national federation.

Local federations, commonly known as central labor-unions, aim to embrace all local unions in a given area, and at the same time to maintain the strict autonomy of each trade or industry. Altho in general, representation, membership, etc., are left by the American Federation to local regulation, the national constitution provides that "no central body affiliated with the American Federation shall reject credentials presented by a duly elected or appointed delegation of a local union, chartered by a national or international union having affiliation with the American Federation."

Next in gradation to the local federation is the state federation of representatives from the various labor organizations in the state. State branches meet annually and seek to exercise functions analogous to those carried on by the national federation in its larger field of activity.

Form of Organization

As a fourth form of organization, the American Federation recognizes as its most important subdivision the national union of workmen engaged in a single calling. In May, 1904, there were 118 international unions having complete jurisdiction over their own trades, with a membership approximating 2,000,000 work-people affiliated with the American Federation of Labor. Structurally, the most important feature of the national federation is the representative convention which meets in annual session. The constitution provides: "The basis of representation in the convention shall be: From national and international unions, for less than 4,000 members, one delegate; 4,000 or more, two delegates; 8,000 or more, three delegates; 16,000 or more, four delegates; and so on. From central bodies, state federations, federal labor-unions, and local unions having no national or international union, one delegate."

In this scheme of representation, a compromise has been sought between equal representation and proportional representation. Proportional representation seemed to give an unfair advantage to the larger unions, and, on the other hand, equal representation placed undue power in the hands of the smaller unions. A system has therefore been adopted by which a part of the membership is represented according to a progressive ratio, and the other part—many of whom

are also represented through their respective national and international unions—by one delegate from each organization.

Strict adherence to this progressive ratio avoids the chief defect of proportional representation; as applied by the American Federation, however, it succeeds in keeping the number of delegates within proper limits rather than in giving each union a measurable weight in legislation. The following law, adopted in 1887, neutralizes any restraint placed on the strong unions by progressive representation: "Questions may be decided by division or a show of hands, but if a call of the roll is demanded by one tenth of the delegates present, each delegate shall cast *one vote for every one hundred members*, or major fraction thereof, he represents, but no city or state federation shall be allowed more than one vote." Thus the power is retained by the large unions with the additional consideration, it is claimed, of harmful centralization in the hands of the few. Where proportional representation prevails, it is difficult to unite the numerous delegates for common action. Under the American Federation's plan of progressive representation, the limited number of men who exercise a controlling voice based on the total membership of their respective unions, are in a position to form a combination at any time to rule the convention.

The chief administrative body of the American Federation is the Executive Council, composed of the national officers: a president, eight vice-presidents, a secretary, and a treasurer. The Executive Council supervises the work and decides questions of policy between conventions. The most important single official is the president. He is elected by the annual convention and holds office for one year. Owing to the voluntary nature of the American Federation, its executive head has comparatively slight official power; but as the recognized leader of the American trade-union movement, he exerts considerable influence over the activities of national and international unions. He receives a fixt annual salary of $3,000. The remaining officers are paid as follows: the secretary and the treasurer, an annual salary of $2,500 and $200 respectively; the vice-presidents, $4 per day and expenses when attending council meetings.

The receipts and expenditures of the American Federation from 1881 to 1905 were as follows:

Year	Receipts	Expenditures	Year	Receipts	Expenditures
1881	$174	$136	1894	$15,346	$17,302
1882	125	252	1895	13,751	15,612
1883	690	352	1896	16,290	15,452
1884	357	543	1897	18,639	19,113
1885	584	450	1898	18,894	19,197
1886	474	510	1899	36,757	30,599
1887	1,939	2,074	1900	71,125	68,373
1888	4,512	3,933	1901	115,220	118,708
1889	6,838	6,578	1902	144,498	119,086
1890	23,849	21,070	1903	247,802	196,015
1891	17,702	13,190	1904	220,995	203,991
1892	17,834	18,324	1905	207,417	196,170
1893	20,864	21,383			

Finances

Starting in 1881 with an annual tax of three cents per member of the affiliated unions, the "Federation of Organized Trades and Labor Unions" reduced this sum to one cent per member the following year. In 1883 provision was made that each national union should pay into the central treasury for 1,000 members or less, $10; 1,000 to 4,000, $20; 4,000 to 8,000, $25; 8,000 to 12,000, $30, etc. When the American Federation was formed in 1886, an annual tax of six cents per member was placed on national and local unions. The following year this tax was reduced to three cents a year for national and local organizations, with a tax of $25 a year on central labor-unions and state federations. After various changes from time to time, the present rate was fixt as follows: "From international or national trade-unions a per-capita tax of one half of one cent per member per month; from local trade-unions and federal labor-unions, ten cents per member per month, five cents of which must be set aside to be used only in case of strike or lockout; from local unions, the majority of whose members are less than eighteen years of age, two cents per member per month; from central and state bodies $10 per year, payable quarterly."

The objects of the American Federation, as stated in the Preamble and Article II. of the Constitution, are as follows:

Whereas, a struggle is going on in all the nations of the civilized world, between the oppressors and the opprest of all countries, a struggle between the capitalist and the laborer, which grows in intensity from year to year and will work disastrous results to the toiling millions if they are not combined for mutual protection and benefit;

It therefore behooves the representatives of the trade- and labor-unions of America, in convention assembled, to adopt such measures and disseminate such principles among the mechanics and laborers of our country as will permanently unite them to secure the recognition of the rights to which they are justly entitled.

We therefore declare ourselves in favor of the formation of a thorough federation, embracing every trade and labor organization in America, organized under the trade-union system.

Article II., Sec. 1. The objects of this federation shall be the encouragement and formation of local trade- and labor-unions, and the closer federation of such societies through the organization of central trade- and labor-unions in every city, and the further combination of such bodies into state, territorial, or provincial organizations, to secure legislation in the interest of the working masses.

Sec. 2. The establishment of national and international trade-unions, based upon a strict recognition of the autonomy of each trade, and the promotion and advancement of such bodies.

Sec. 3. An American federation of all national and international trade-unions, to aid and assist each other; to aid and encourage the sale of union-label goods; and to secure national legislation in the interest of the working people, and influence public opinion, by peaceful and legal methods, in favor of organized labor.

Sec. 4. To aid and encourage the labor press of America.

Aside from the more general activities involved in the closer association of trades, certain typical activities are displayed by the American Federation in (*a*) the use of the union label, (*b*) boycotts and strikes, (*c*) the introduction of the eight-hour day, and (*d*) politics and legislation.

Union Labels

(*a*) The American Federation has made no attempt to control the labels of its national and international unions, merely indorsing and advocating those already adopted by the different trades. Local and federal unions directly attached to the American Federation, however, receive their labels from national headquarters. The federation calls upon all union men to demand goods bearing the union stamp, and urges the formation of active labor leagues to aid in educating the consuming public to the nature, appearance, and value of trade labels. In order to gain uniformity and more particularly to prevent counterfeiting, a universal label has from time to time been suggested. In 1900 the officials of the American Federation obtained a legal opinion to the effect that counterfeiting could be better punished if all unions would surrender their labels and adopt that of the Federation of Labor. Inasmuch as this would involve the surrender by each union of some part of the very trade autonomy for which the federation has always contended, and the recognition of the federation as one organization, at least for the purpose of "issuing, controlling, protecting, and defending the universal label," the step has not been taken. The secretary reported to the

twenty-fifth convention (1905) that there were fifty-six labels and ten cards issued by national unions which had received the indorsement of the American Federation.

(*b*) The federation has paid considerable attention to the exercise of the boycott as a national function. The method usually employed is as follows: Local or national unions with grievances against certain firms send resolutions to the headquarters of the American Federation of Labor. The committee of the Federation whose duty it is to investigate the justice of the complaint, reports to the executive council, or to the annual convention if in session.

Strike Policy

In case the complaint is deemed just, a boycott is declared on the products of the firm or firms involved, and the names of the manufacturers are published monthly in the "unfair list" of *The American Federationist*, the official journal of the American Federation of Labor. In addition to placing the firms on the "unfair list," circulars are sent to the unions in the federation, requesting all union men to cease purchasing the products of the boycotted firms. At the present time the national officials exercise considerable care in the use of the boycott, and concentrate attention upon a small number of firms.

The American Federation of Labor has regarded the strike as the best means to gain trade-union ends under a system of capitalistic production, and has advocated thorough organization along trade lines as the strongest protection to labor. Being merely an advisory center, and depending upon the voluntary loyalty of trade-unionists working through their respective nationals, the federation has been unable to act positively or directly with respect to strikes. It can recommend and urge certain policies, but it lacks the centralized control, and has in consequence followed a conservative course through the various conflicts between employer and employee. The secretary of the American Federation before the fifteenth annual convention, 1895, declared that sympathetic strikes were not opposed and assistance would be given wherever it was needed; nevertheless, he added, as there is a limit to the assistance exacted of one union in support of another union, the safest plan is to allow the individual organization itself to be the judge. This position, when strictly adhered to, limits the federation in its activity to a convenient center from which moral and financial aid may be distributed.

(*c*) In 1882 the platform of the Federation of Organized Trades and Labor Unions declared: "The National Eight-Hour Law is one intended to benefit labor and relieve it partly of its burdens. We therefore demand the enforcement of said law in the spirit of its designers."

Eight-Hour Movement

A resolution of the third session in 1883 stated that the federation "considers the question of shortening the hours as paramount to all other questions at present"; and in the secretary's report to the convention of 1884, a plan to shorten the hours of labor was strongly urged. In consequence of this agitation it was suggested that the unions be canvassed as to the desirability of a universal strike not later than May 1, 1886, at which time all branches should simultaneously demand the eight-hour day. Realizing that the federation was weak in authority and numerical strength, the officials asked the cooperation of the Knights of Labor. The latter organization failed to support the movement, and the plan did not reach serious proportions. The next attempt came in 1888, when a resolution passed the annual convention of the American Federation of Labor, fixing May 1, 1890, as the day for a general strike, and arranging for preparatory mass-meetings to be held in various cities and towns. Renewed efforts to form a temporary alliance with the Knights of Labor failed, but circulars and pamphlets were scattered widely, and prominent speakers were sent by the American Federation to different parts of the country to prepare trade-union members for the proposed universal strike.

Warned by the complete failure of previous general strikes, the more advanced leaders agreed that the struggle could be carried on more successfully if certain trades were selected to make the fight, supported by the combined strength of the other unions working through the federation. Consequently a series of individual trade strikes was determined upon, in which one trade after the other would be selected to strike for shorter hours until all trades had obtained the eight-hour day. In the eight-hour strike of 1890, the Brotherhood of Carpenters and Joiners was selected by the federation to make the fight. A special assessment was levied, and every effort made to win the strike, with the result that the carpenters and joiners established the eight-hour day in several large cities. Finally, at the twenty-fourth annual convention, the American Federation indorsed the eight-hour movement of the International Typographical Union, and promised to levy the constitutional assessment on the membership if, at any time after Jan. 1, 1906, the Typographical Union needed further assistance.

(*d*) The American Federation thus far has successfully resisted all attempts to engage the organization in political activity. Freedom from political affiliation has not been maintained without a struggle on the part of the more conservative element in the federation.

Political Attitude

The first convention held in Pittsburg declared, "that we recommend all trades and labor organizations to secure proper representation in all lawmaking bodies by means of the ballot, and to use all honorable measures by which this result can be accomplished." At almost every convention of the American Federation, and invariably at meetings of local, state, and national unions, the same question has arisen in some form or other. Particularly have the political Socialists endeavored to commit the federation to political socialism, but thus far without success. So long as the pressure upon the federation to declare for independent action did not become annoying, a positive declaration of principles was withheld. But when the Socialist Labor Party as a member of the Central Labor Federation of New York City sought admission into the Federation of Labor, the application was rejected on the ground that no political party as a party has the right to be represented in the councils of trade-unions. With most immediate socialistic proposals, the federation, however, is in sympathy.

Among the important subjects before the convention of 1893 was the following "political program," which was referred to the affiliated unions to be voted upon during the year:

WHEREAS, the trade-unionists of Great Britain have, by the light of experience and the logic of progress, adopted the

principle of independent labor politics as an auxiliary to their economic action; and

WHEREAS, such action has resulted in the most gratifying success; and

WHEREAS, such independent labor politics are based upon the following program, to wit:

1. Compulsory education.
2. Direct legislation.
3. A legal eight-hour work-day.
4. Sanitary inspection of workshop, mine, and home.
5. Liability of employers for injury to health, body, or life.
6. The abolition of the contract system in all public work.
7. The abolition of the sweating system.
8. The municipal ownership of street-cars, and gas and electric plants for public distribution of light, heat, and power.
9. The nationalization of telegraphs, telephones, railroads, and mines.
10. The collective ownership by the people of all means of production and distribution.
11. The principle of the referendum in all legislation.

Therefore, RESOLVED, that this convention hereby indorses this political action of our British comrades; and

RESOLVED, that this program and basis of a political labor movement be, and is hereby, submitted for the consideration of the labor organizations of America, with the request that their delegates to the next annual convention of the American Federation of Labor be instructed on this most important subject.

At the fourteenth convention, 1894, the first nine planks of this political platform were adopted with little discussion and with substantially no change. Plank 11 was incorporated with plank 2, making that plank read: "Direct legislation through the initiative and referendum." Plank 3 was made to read "a legal work-day of not more than eight hours." In plank 8 the words "water-works" were substituted after the words "street-cars." The great discussion came on plank 10. After a long debate it was defeated, and three resolutions substituted for it, as follows: (1) The abolition of the monopoly system of landholding, and the substitution therefor of a title of occupancy and use only (carried by a vote of 1,217 to 913). (2) The repeal of all conspiracy and penal laws affecting seamen and other workmen, incorporated in the federal and state laws of the United States. (3) The abolition of the monopoly privilege of issuing money, and substituting therefor a system of direct issuance to and by the people. Subsequent efforts on the part of radical trade organizations became so persistent that the New York convention of 1895 declared: "Party politics, whether they be Democratic, Republican, Socialistic, Populistic, Prohibition, or any other, shall have no place in the conventions of the American Federation of Labor." Succeeding attempts to commit the organization to a definite political program have been defeated, so that at the present time the American Federation stands independent of party affiliation.

As the American Federation wields little authority over the national unions, and has no way to secure unity of sentiment on any political issue, the probable result of independent political action would be internal strife with danger of complete disruption. Accordingly, the federation has chosen to advocate labor legislation and to take an active part in any move leading to the betterment of labor conditions rather than to participate as an organization in national and state elections. Each convention directs attention to special reforms, whereupon the executive council frames a bill embodying the necessary provisions, and champions its course. The legislative committee maintained at Washington is especially helpful in promoting this work. Among the chief reforms so advocated in recent years have been: The national eight-hour law, Chinese exclusion, the initiative and referendum, trust legislation, anti-injunction laws, and the abolition of convict and imported contract labor. In addition to these efforts, the federation has sought to prevent legislation considered harmful to the working classes in general, such as anti-scalping laws, compulsory arbitration, and compulsory union incorporation.

Thus in the general activities of the American Federation are reflected something of that prudence and moderation which characterize the present industrial life of the East. It has advocated the individual trade strike in preference to the general or sympathetic strike; it has repeatedly placed itself on record as opposed to political action; it has advanced the principle of organization according to trades; and lastly, by guaranteeing to each national or international union complete jurisdiction over its own trade, has gained to a large extent the good-will of the individual members. So long as efficient leadership maintains this traditional conservatism there is every reason to predict that the American Federation will remain an important factor in the American labor movement. Much credit for this must be given to its president, Mr. Samuel GOMPERS, one of its founders, elected its first president, and so continuing with the exception of one year (1895) down to the present time.

The organization in October, 1906, had an enrolment of 119 international unions consisting of approximately 27,500 local unions, 36 state federations, 538 central labor-unions, and 759 local trade- and federal labor-unions. It is claimed that the unions represent a membership of over 2,000,000.

Some 250 monthly or weekly periodicals are published by the unions, but *The Federationist*, edited by Mr. Gompers and published monthly, is the official organ.

The officers of the federation are: President, Samuel Gompers, Washington, D. C.; secretary, Frank Morrison, Washington, D. C.; treasurer, John B. Lennon, Bloomington, Ill.; first vice-president, James Duncan, Boston, Mass.; second, John Mitchell, Indianapolis, Ind.; third, James O'Connell, Washington, D. C.; fourth, Max Morris, Denver, Col.; fifth, Denis A. Hayes, Philadelphia, Pa.; sixth, Daniel J. Keefe, Detroit, Mich.; seventh, William D. Huber, Indianapolis, Ind.; eighth, Joseph F. Valentine, Cincinnati, O.

The headquarters of the organization are at 423 G Street, N. W., Washington, D. C.

The growth of the central organization of the principal national trade-unions since 1896 is set forth in the following table compiled from the secretary's report to the convention of 1904 :

Year	Charters Issued				Gains in Membership	Net Gain in Membership	Total Membership	National Unions affiliated	Receipts	Expenditures.
	National Unions	State and City Federations	Local Unions	All Organizations						
1897	8	20	189	217	62,292	7,490	264,825	55	$18,640	$19,114
1898	9	12	182	203	34,280	14,791	278,016	67	18,894	19,197
1899	9	36	405	450	141,390	71,406	349,422	73	36,757	30,591
1900	14	101	734	849	300,446	198,899	548,321	82	71,126	68,373
1901	7	127	782	916	361,410	239,216	787,537	87	115,221	118,708
1902	14	138	877	1,024	283,827	236,862	1,024,399	97	144,498	119,087
1903	20	174	1,139	1,333	615,731	441,401	1,465,800	113	247,803	196,016
1904	11	104	328	443	253,485	209,600	1,675,400	120	220,996	203,991

In 1906 the executive council of the federation, moved somewhat by the political successes of the English Labor Party (see GREAT BRITAIN), determined, not indeed to change the non-partizan policy of the federation, but to urge upon all unions and members affiliated with it to make a strenuous political effort, irrespective of party, to defeat candidates for Congress and others who were opposed to the views of labor, and to elect those friendly thereto. A committee of the federation reported a list of those candidates for Congress who should be supported, as well as a list of those who were to be defeated, and Mr. Gompers and others undertook a strenuous campaign against the latter. The council embodied its demands in the following Bill of Grievances:

HONORABLE THEODORE ROOSEVELT, *President of the United States;*

HONORABLE WILLIAM P. FRYE, *President pro tempore, United States Senate;*

HONORABLE JOSEPH G. CANNON, *Speaker, House of Representatives, United States.*

GENTLEMEN: The undersigned Executive Council of the American Federation of Labor, and those accompanying us in the presentation of this document, submit to you the subject-matter of the grievances which the workmen of our country feel by reason of the indifferent position which the Congress of the United States has manifested toward the just, reasonable, and necessary measures which have been before it these past several years, and which particularly affect the interests of the working people, as well as by reason of the administrative acts of the executive branches of the government and the legislation of the Congress relating to these interests. For convenience the matters of which we complain are briefly stated, and are as follows:

Bill of Grievances

Eight-Hour Law.—The law commonly known as the Eight-Hour Law has been found ineffective and insufficient to accomplish the purpose of its designers and framers. Labor has, since 1894, urged the passage of a law so as to remedy the defects, and for its extension to all work done for or on behalf of the government. Our efforts have been in vain.

Without hearing of any kind granted to those who are the advocates of the Eight-Hour Law and principle, Congress passed, and the president signed, an appropriation bill containing a rider nullifying the Eight-Hour Law and principle in its application to the greatest public work ever undertaken by our government, the construction of the Panama Canal.

The Eight-Hour Law in terms provides that those intrusted with the supervision of government work shall neither require nor permit any violations thereof. The law has been grievously and frequently violated. The violations have been reported to the heads of several departments, who have refused to take the necessary step for its enforcement.

Convict Labor.—While recognizing the necessity for the employment of inmates of our penal institutions, so that they may be self-supporting, labor has urged in vain the enactment of a law that shall safeguard it from the competition of the labor of convicts.

Immigration.—In the interest of all of our people, and in consonance with their almost general demand, we have urged Congress for some tangible relief from the constantly growing evil of induced and undesirable immigration, but without result.

Chinese Exclusion.—Recognizing the danger of Chinese immigration, and responsive to the demands of the people, Congress years ago enacted an effective Chinese exclusion law; yet, despite the experience of the people of our own country, as well as those of other countries, the present law is flagrantly violated, and now, by act of Congress, it is seriously proposed to invalidate that law and reverse the policy.

Seamen's Rights.—The partial relief secured by the laws of 1895 and 1898, providing that seamen shall not be compelled to endure involuntary servitude, has been seriously threatened at each succeeding Congress. The petitions to secure for the seamen equal right with all others have been denied, and a disposition shown to extend to other workmen the system of compulsory labor.

Ship Subsidy.—Under the guise of a bill to subsidize the shipping industry, a provision is incorporated, and has already passed the Senate, providing for a form of conscription, which would make compulsory naval service a condition precedent to employment on privately owned vessels.

Having in mind the terrible and unnecessary loss of life attending the burning of the *Slocum* in the harbor of New York, the wreck of the *Rio de Janeiro* at the entrance to the Bay of San Francisco, and other disasters on the waters too numerous to mention—in nearly every case the great loss of life was due to the undermanning and the unskilled manning of such vessels—we presented to Congress measures that would, if enacted, so far as human law could do, make impossible the awful loss of life. We have sought this remedy more in the interests of the traveling public than in that of the seamen, but in vain.

Having in mind the constantly increasing evil growing out of the parsimony of corporations, of towing several undermanned and unequipped vessels, called barges, on the high seas, where, in case of storm or stress, they are cut loose to drift or sink, and their crews to perish, we have urged the passage of a law that shall forbid the towing of more than one such vessel unless they shall have an equipment and a crew sufficient to manage them when cut loose and set adrift; but in vain.

Trusts and Interstate Commerce.—The antitrust and interstate commerce laws enacted to protect the people against monopoly in the products of labor, and against discrimination in the transportation thereof, have been perverted, so far as the laborers are concerned, so as to invade and violate their personal liberty as guaranteed by the Constitution. Our repeated efforts to obtain redress from Congress have been in vain.

Anti-Injunction Bill.—The beneficent writ of injunction, intended to protect property rights, has, as used in labor disputes, been perverted so as to attack and destroy personal freedom, and in a manner to hold that the employer has some property rights in the labor of the workmen. Instead of obtaining the relief which labor has sought, it is seriously threatened with statutory authority for existing judicial usurpation.

Committee on Labor.—The Committee on Labor of the House of Representatives was instituted at the demand of labor to voice its sentiments, to advocate its rights, and to protect its interests. In the past two Congresses this committee has been so organized as to make ineffectual any attempt labor has made for redress. This being the fact in the last Congress, labor requested the speaker to appoint on the Committee on Labor members who, from their experience, knowledge, and sympathy, would render in this Congress such service as the committee was originally designed to perform. Not only was labor's request ignored, but the hostile make-up of the committee was accentuated.

Right of Petition Denied Government Employees.—Recently the president issued an order forbidding any and all government employees, upon the pain of instant dismissal from the government service, to petition Congress for any redress of grievances or for any improvement in their condition. Thus the constitutional right of citizens to petition must be surrendered by the government employee in order that he may obtain or retain his employment.

Redress for Grievances.—We present these grievances to your attention because we have long, patiently, and in vain waited for redress. There is not any matter of which we have complained but for which we have, in an honorable and lawful manner, submitted remedies. The remedies for these grievances proposed by labor are in line with fundamental

law, and with the progress and development made necessary by changed industrial conditions.

Labor brings these, its grievances, to your attention because you are the representatives responsible for legislation and for failure of legislation. The toilers come to you as, your fellow-citizens, who, by reason of their position in life have not only with all other citizens an equal interest in our country, but the further interest of being the burden bearers, the wage-earners of America. As labor's representatives we ask you to redress these grievances, for it is in your power so to do.

Labor now appeals to you, and we trust that it may not be in vain. But if, perchance, you may not heed us, we shall appeal to the conscience and the support of our fellow-citizens.

(Signed) *Executive Council, American Federation of Labor.*

AMERICAN FORESTRY ASSOCIATION, THE: Organized 1882; incorporated 1897. Objects: (1) The promotion of a business-like and conservative use and treatment of the forest resources of this country. (2) The advancement of legislation tending to this end both by the states and the Congress of the United States, the inauguration of forest administration by the Federal Government and by the states, and the extension of sound forestry by all proper methods. (3) The diffusion of knowledge regarding the conservation, management, and renewal of forests, the proper utilization of their products, methods of reforestation of waste lands, and the planting of trees.

The association enrols all who realize the importance of the preservation of forests, and in particular appeals to owners of woodlands, to lumbermen and foresters, as well as to engineers, professional and business men who have to do with wood and its manifold uses, and to persons concerned in the conservation of water supplies for irrigation and other purposes. The dues are $2 per year. The association has more than 5,000 members, residents of every state in the Union, Canada, and foreign countries. It has its own organ, *Forestry and Irrigation*, which is sent free to all members each month. President, Hon. James Wilson, United States Secretary of Agriculture. Secretary, Prof. Thos. E. Will, 1311 G Street, Washington, D. C.

AMERICAN INSTITUTE FOR SOCIAL SERVICE, THE: Organized in New York City in 1902, as the outgrowth of the League for Social Service, which was founded in 1898 by Drs. Josiah Strong and Tolman. Objects: (1) To gather from all possible sources facts of every kind which bear on social and industrial betterment. (2) To interpret these facts by ascertaining their causes and effects, thus gaining their real significance; and (3) To disseminate the resulting knowledge for the education of public opinion, which is the generic social reform.

The membership is limited to forty, but the constitution provides that men and women distinguished for public service or deeply interested in industrial and social betterment may be elected associates. Distinguished students of social subjects are elected collaborators.

The institute has a large number of foreign collaborators, and has been influential in starting similar institutes in Great Britain, Sweden, and elsewhere; while it is in active communication with societies of a similar nature in other countries. In this way a considerable international exchange of information has resulted, and has been published in *Social Progress*, edited by Dr. Strong and others. The institute has made noteworthy sociological exhibits at the expositions of Paris (1900), St. Louis (1904), Liège (1905), and Milan (1906); and it arranged for an Exposition of Safety Devices in New York (December, 1906). Out of this has grown a movement for a permanent museum of Safety Devices in New York City. See Museums of Security. The institute is now specially active in establishing classes in Social Christianity in churches, societies, etc. The institute makes special investigations, at cost only, for students and others desiring such services; and it disseminates the information it collects to its members in all countries. Annual dues: Members, $2; Societies, $5. President, Josiah Strong, Bible House, Fourth Avenue, New York City.

AMERICAN PEACE SOCIETY, THE: The oldest and strongest of the associations in this country devoted exclusively to the promotion of international peace; organized in New York in 1828. Through the influence of William Ladd, the American "Apostle of Peace," the various state and local peace societies, which had been at work since 1815, were induced to unite and thus establish a national organization.

The society moved to Hartford, Conn., in 1835, and then to Boston in 1827, where its headquarters have been ever since. As early as the "thirties" the society advocated the general adoption of arbitration, and the establishment of a permanent congress and court of nations. The monthly journal of the society, *The Advocate of Peace*, first published at Hartford by William Watson, for the Connecticut Peace Society, has appeared since 1834. The society, before taking over this paper, had previously published *The Harbinger of Peace* and *The Calumet*.

The purpose of the society was from the first declared to be to "diffuse light respecting the evils of war and the best means of effecting its abolition." This twofold aim has been its object ever since. It has been among the foremost of the agencies advocating a permanent system of arbitration for the settlement of all international controversies. In 1840 the Society published, in a book of 700 pages, "Prize Essays on a Congress of Nations." It has since published and distributed many millions of pages of books and pamphlets, on all phases of the subjects of peace and war. Through its agency many valuable contributions have been made to the literature of international peace, including Sumner's oration on the "War System of the Commonwealth of Nations," Emerson's "Essay on War," Channing's "Lecture on War," Judge Jay's "Review of the Mexican War," etc.

The society was the first to take up, at the suggestion of Joseph Sturge of England, in 1841, the idea of holding international peace congresses. The result was the first great congress held in Exeter Hall, London, in 1843, organized by the London Peace Society. Out of this first congress grew the remarkable series of congresses from 1848 to 1851, in which the American Peace Society had large delegations. In 1872, through the efforts of Dr. James B. Miles, then secretary of the society, the International Law Association was organized, and held its first meeting in Brussels the following year. Twenty-three conferences of this association have been held, the last of which was at Berlin in October, 1906. This association has done much for the promotion of arbitration, the improvement of international law, and better relations in general between the nations.

Beginning in 1837 with a petition to the Legislature of Massachusetts, the society has been active with both the state and national governments with a view to practical legislative action toward permanent international arbitration and peace. It was the first to suggest, in the "eighties," the holding of a Pan-American conference, for the purpose of promoting greater friendship and better trade relations between the American states.

The American Peace Society has been represented in nearly all of the international peace congresses held since 1889, as well as in the national arbitration conferences held at Washington; and many of its members have been prominent in the work of the Mohonk Arbitration Conference, organized in 1895 by Mr. Albert K. Smiley.

In the spring of 1903 a resolution, prepared by the secretary of the society, and supported by a considerable number of individuals outside, was unanimously voted by the Massachusetts Legislature, urging the Congress and Government

of the United States to take steps toward the establishment of a periodic congress of nations. This proposal has met with unexpectedly strong and wide approval, has been made a leading feature of the program of the INTERPARLIAMENTARY UNION, and will probably be one of the foremost subjects of discussion at the second Hague conference.

The society is stronger, more active, and more influential to-day than ever before in its history. It has a growing membership in all parts of the United States. By means of committees it is promoting interest in the peace movement among business men, among workingmen, among ministers and churches, etc. President, Hon. Robert Treat Paine. Secretary, Benjamin F. Trueblood, 31 Beacon Street, Boston, Mass.

AMERICAN POLITICAL SCIENCE ASSOCIATION, THE: Founded 1903. Object: The encouragement of the scientific study of politics, public law, administration, and diplomacy. It meets annually in December. Dues, $3. President, Albert Shaw, New York. Vice-presidents: Albert Bushnell Hart; F. N. Judson; H. A. Garfield. Secretary and treasurer, W. W. Willoughby, Johns Hopkins University, Baltimore, Md.

AMERICAN PROPORTIONAL REPRESENTATION LEAGUE, THE: Organized (1893) to promote the reform of legislative assemblies, by abandoning the present system of electing single representatives on a majority or plurality vote in limited territorial districts, and by substituting the following provisions:

(1) That all representatives be elected "at large," on a general ticket either without district divisions or in districts as large as practicable.

(2) That the election be in such form that the several parties or political groups shall secure representation in proportion to the respective number of votes cast by each. President, William Dudley Foulke, Richmond, Ind. Secretary, Robert Tyson, 10 Harbord Street, Toronto, Can.

AMERICAN PROTECTIVE ASSOCIATION, THE: A secret association, commonly called the A. P. A. It was organized in 1887 against the asserted attack of Roman Catholicism upon the American public school and other American institutions. In 1890 or thereabouts it became very active, published an outspoken organ in Boston, Mass., and created widespread agitation and excitement. The association was organized by H. F. Bower, and rapidly grew in strength, claiming in 1895 a membership of 2,000,000, and extending into Canada, Great Britain, and Australia. Its influence, however, soon disappeared, and has now practically passed away.

The reasons given for the existence of the order were stated by one of its members to be as follows:

(1) The Roman Catholic attack on our public-school system. (2) The attempted foreignizing, by force, of whole communities, in language and religion, by Romish priests. (3) The complete control of our great cities by Romanism. (4) The fact that our army and navy are almost wholly Romanized. (5) The remarkable increase of untaxed church property. (6) The frequent desecration of the American flag by priests. (7) The Jesuit control of the heads of the government at Washington. (8) The well-known public declaration of the Pope that the United States is his one bright hope for the future.

As a proof of the need of the order, the Rev. James B. Dunn, secretary of the Committee of One Hundred, of Boston, in a tract published by the committee, quotes from the papal encyclical of Jan. 10, 1890, where the Pope states that Roman Catholics are:

Papal Encyclicals

Even in politics, always to serve first the interests of Catholicism, and to submit themselves in obedience to the will of the pontiff as to God himself, and that the civil laws are binding on them only so long as they are conformable to the Roman Catholic religion. In that same encyclical the Pope says it is a duty to resist all civil laws hostile to anything ordered by the Church, and a crime to obey them. These being the facts, is it not quite certain that whatever his private or personal opinion and feelings may be as an American citizen, every good Roman Catholic must support the Church as against the State? . . .

That cases happen in which the State demands one thing from the citizen, and religion the opposite from Christians, and this undoubtedly *for no other reason* than that the heads of the State pay no regard to the sacred power of the Church, or desire to make it subject to them. No one, however, can doubt which is to receive their preference. . . . It is an impious deed to break the laws of Jesus Christ for the purpose of obeying the magistrates, or *to transgress the laws of the church* under the pretext of observing the civil law. . . .

If the laws of the State are in open contradiction with the divine law, if they command anything *prejudicial to the Church*, or are hostile to the duties imposed by religion, or violate *in the person* of the supreme pontiff the authority of Jesus Christ, then indeed it is a duty to *resist* them and a *crime* to obey them—a crime fraught with injury to the State itself. . . .

Furthermore, in politics, which are inseparably bound up with the laws of morality and religious duties, men ought *always* and in the *first place to serve*, as *far as possible*, the *interests of Catholicism*. As soon as they are seen to be in danger, all differences should cease between Catholics. Since the fate of states depends principally on the disposition of those who are at the head of the government, the Church cannot grant its patronage or favor to men whom it knows to be hostile to it, who openly refuse to respect its rights, who seek to break the alliance established by the nature of things between religious interests and the interests of the civil order. On the contrary, its duty is to favor those who, *having sound ideas as to the relations between Church and State, wish to* make them both harmonize for the common good. These principles contain the rule according to which every Catholic *ought to model his public life.*

Dr. Dunn also quotes one of Cardinal Manning's sermons, representing the Pope as saying:

I acknowledge no civil superior; I am the subject of no prince; and I claim more than this. I claim to be the supreme judge on earth, and director of the consciences of men; of the peasant that tills the field, and the prince that sits on the throne; of the household that lives in the shade of privacy, and the legislature that makes laws for kingdoms. I am the sole last supreme judge on earth of what is right and wrong.

Of these and other similar quotations Dr. Dunn says:

In view of such declarations and teachings, we ask, Can a good Romanist be at the same time a loyal American citizen? Many Romanists, no doubt, mean to be loyal citizens of the republic, and honestly think they are; yea, we are quite willing to believe that the great body of them have no wish to interfere with the liberties and institutions of America, and that if called upon to choose between serving our government and the power at Rome, think they would abjure Rome. But it must be remembered that they belong to a system in which free agency is impossible. As we have seen, the Vatican claims absolute and supreme authority in all things, civil as well as spiritual, and every member of that Church is bound to render to the pontiff absolute and unquestioning obedience. . . . Can any person who is loyal to Romanism be true to republicanism? Can a Romanist be a good citizen of America? . . .

(For an answer from the Roman Catholic standpoint to the statements of the A. P. A., see ROMAN CATHOLIC CHURCH AND SOCIAL REFORM.)

Arguments against the A. P. A.

But Romanists are by no means the only ones who criticize and oppose the attitude of the A. P. A. H. K. Carroll wrote in *The Methodist Review*, 1895, a plea for Protestants to conquer their prejudices and to be reasonable in the matter. Concerning the assertion

that Roman Catholics cannot be good citizens, Dr. Carroll says:

Are Catholics disloyal? I do not remember ever to have seen the affirmative of this question supported by the citation of any act. It is commonly argued from the doctrine of papal supremacy. Catholics, it is urged, know no higher law than obedience. The people obey the priests implicitly, the priests are in complete subjection to the bishops, and the bishops are bound to do whatever the Pope tells them. This Pope is a foreign potentate who assumes to be superior to kings and governments; and he would, if he could, subordinate the State to the Church. In answer let me ask, Is it not obvious that he could not if he would? Where is there a state over which he exercises even a shadow of sovereignty?"

Concerning the relation of the Roman Catholic Church to our public schools, Dr. Carroll says:

Does the Church of Rome desire to destroy our public-school system? "Destroy" is a strong word. I doubt whether it is right to apply it even to the most hostile opinion that prevails among the hierarchy. The most any Catholic has asked for is exemption from payment of the public-school tax or division of the school funds. In neither case would the system be destroyed. If the first alternative were adopted it would impair the integrity of the system and limit it. It would not be for all the people as it is now, but only for the larger part of them. If the second proposal were accepted we should have in this country the conditions that prevail in England and elsewhere. We should have both the secular and religious elements represented in our public schools. The system would be greatly changed and impaired, but it would not be destroyed. It would not be fair, I think, to say that the hierarchy would destroy our public school; but it is fair to say that they are not satisfied with it as it is.

AMERICAN PURITY ALLIANCE, THE: Incorporated under this name in 1895, as the continuation of the New York Committee for the Prevention of State Regulation of Vice, which commenced its work in 1876 and has held thirty annual meetings.

Objects: The repression of vice, the prevention of its regulation by the State, the better protection of the young, the rescue of the fallen, the extension of the White Cross among men, and to maintain the law of purity as equally binding upon men and women.

The chief present work of the alliance consists in organizing methods for the instruction of the young in schools and colleges, for the information of teachers, parents, and physicians in sexual hygiene; the distribution of purity literature, of which a supply of thirty-four pamphlets is kept on hand at its headquarters; and the publication of *The Philanthropist*. It is the American branch of the International Federation for the Suppression of State Regulation of Vice, and is actively interested in the suppression of the "White Slave" traffic. It is constantly at work to prevent attempts at state or city regulation of prostitution. Annual dues, $1. President, O. Edward Janney, M.D., Baltimore, Md. Recording Secretary, Percy Russell; Office Secretary, Elizabeth Storer. Office, 207 East Fifteenth Street, New York City.

AMERICAN RAILWAY UNION, THE: A union organized in Chicago in 1893 under the leadership of Eugene V. Debs. It played a large part in the PULLMAN STRIKE, and virtually ceased to exist after the failure of that strike. The report of the Commission on the Pullman Strike said of this union:

The theory underlying this movement is that the organization of different classes of railroad employees (to the number of about 140,000) upon the trade-union idea has ceased to be useful or adequate; that pride of organization, petty jealousies, and the conflict of views into which men are trained in separate organizations under different leaders, tend to defeat the common object of all, and enable railroads to use such organizations against each other in contentions over wages, etc.; that the rapid concentration of railroad capital and management demands a like union of their employees for the purpose of mutual protection; that the interests of each of the 850,000 or more railroad employees of the United States, as to wages, treatment, hours of labor, legislation, insurance, mutual aid, etc., are common to all, and hence all ought to belong to one organization that shall assert its united strength in the protection of the rights of every member.

AMERICAN SECULAR UNION AND FREE-THOUGHT FEDERATION, THE: Organized 1876. Object: "To propagate the nine demands of liberalism as specified in our constitution. To effect a total separation of Church and State, not only in name as it now is, but as an actual fact. Taxation of church property, the elimination of all religious teaching in the public schools, and the abolition of all those clearly unconstitutional measures which are wrongly called Sunday laws." Annual report, $1. Secretary, E. C. Reichwald, 141 South Water Street, Chicago.

NINE DEMANDS OF LIBERALISM

(1) We demand that churches and other ecclesiastical property shall be no longer exempt from taxation.

(2) We demand that the employment of chaplains in Congress, in the legislatures, in the navy and militia, and in prisons, asylums, and all other institutions supported by the public money, shall be discontinued.

(3) We demand that all public appropriations for educational and charitable institutions of a sectarian character shall cease.

(4) We demand that all religious services now sustained by the government shall be abolished; and especially that the use of the Bible in the public schools, whether ostensibly as a text-book or avowedly as a book of religious worship, shall be prohibited.

(5) We demand that the appointment, by the President of the United States or by the governors of the various states, of all the religious festivals and feasts shall wholly cease.

(6) We demand that the judicial oath in the courts and in all other departments of the government shall be abolished, and that simple affirmation under the pains and penalties of perjury shall be established in its stead.

(7) We demand that all laws directly or indirectly enforcing the observance of Sunday as the Sabbath shall be repealed.

(8) We demand that all laws looking to the enforcement of "Christian" morality shall be abrogated, and that all laws shall be conformed to the requirements of natural morality, equal rights, and impartial liberty.

(9) We demand that not only in the Constitution of the United States and of the several states, but also in the practical administration of the same, no privilege or advantage shall be conceded to Christianity or any other special religion; that our entire political system shall be founded and administered on a purely secular basis; and whatever changes shall prove necessary to this end shall be consistently, unflinchingly, and promptly made.

AMERICAN SOCIAL SCIENCE ASSOCIATION, THE: Founded 1865 in Boston, Mass., at a meeting called by Drs. S. G. Howe, Nathan Allen, R. T. Davis, and F. B. Sanborn, and presided over by Gov. John A. Andrew. Its first president was Prof. W. B. Rogers, founder of the Boston Institute of Technology; and its first secretaries Dr. Samuel Eliot and F. B. Sanborn. Ensuing presidents have been Dr. Samuel Eliot, George William Curtis, Prof. B. Peirce, President Gilman of Baltimore, President A. D. White of Cornell, Gen. John Eaton, Carroll D. Wright, Prof. Francis Wayland, F. J. Kingsbury, Oscar S. Straus, and other eminent scholars and publicists. It conducts its work under the five departments of Education, Finance, Health, Jurisprudence, and Social Economy. Heads of these departments have been David A. Wells, Dr. Francis Lieber, George S. Boutwell, President Woolsey, Charles L. Brace, Robert Treat Paine, John Graham Brooks, Edward Atkinson, Dr. Walter Channing, Dr. Stephen Smith, Judge S. E. Baldwin, Rev. H. L. Wayland, Robert C. Winthrop, Judge

Emory Washburn, and many others. Mr. Sanborn remained secretary from 1865 until 1898, and was succeeded by Rev. F. S. Root, who died in 1906, and was succeeded by Prof. I. F. Russell of New York, the present secretary. Meetings have been held annually for forty-two years, and hundreds of addresses and papers have been read, many of them afterward published in *The Journal of Social Science*, edited in turn by S. Eliot, Henry Villard, F. B. Sanborn, and F. S. Root. From the Social Science Association have sprung the National Prison Association, the National Conference of Charities, and numerous branch societies, clubs, etc. Its main office was for years in Boston, then in New Haven, Conn., and is now in New York. It numbers some 600 members in all parts of the United States, but chiefly in New York and New England. Secretary, Prof. I. F. Russell, 120 Broadway, New York City.

AMERICAN STATISTICAL ASSOCIATION, THE: This association was organized in 1839, and has a membership of about 600. A quarterly publication was begun in 1888, by means of which special statistical monographs are being presented to the public, and in addition this journal contains a record of current statistical literature, which is intended to inform the members concerning the most important and recent statistical inquiries made in foreign countries. This publication has reached (March, 1906), its seventy-third number, and is recognized as a valuable record of statistical work. The present constitution of the association is as follows:

ART. I. This association shall be denominated the American Statistical Association.

ART. II. The objects of the association shall be to collect, preserve, and diffuse statistical information in the different departments of human knowledge.

ART. III. The association shall be composed of fellows and honorary members.

ART. IV. All members shall be chosen by the board of directors, the affirmative votes of four-fifths of the members of said board being necessary to a choice. Each fellow shall pay annually $2, or $20 at some one time.

ART. V. Fellows only shall be entitled to vote, but honorary members shall have the right to sit and deliberate in all the meetings of the association.

(ARTS. VI., VII., and VIII. omitted.)

NOTE.—Each member shall be entitled to receive all reports and publications of the association.

The association's presidents have been: Hon. Richard Fletcher, A.M., LL.D.; George C. Shattuck, M.D., LL.D.; Edward Jarvis, A.M., M.D., and Francis A. Walker, Ph.D., LL.D. Its present officers are: President, Carroll D. Wright, LL.D. Vice-presidents, Horace G. Wadlin, Litt.D.; Henry C. Adams, Ph.D.; Henry Gannett; S. N. D. North, LL.D.; Walter F. Willcox, Ph.D. Corresponding secretary and librarian, Horace G. Wadlin, Litt.D., Public Library, Boston, Mass. Treasurer, S. B. Pearmain, 53 State Street, Boston, Mass. Recording Secretary, Carroll W. Doten, A.M., Institute of Technology, Boston, Mass. Councilors, Cressy L. Wilbur, M.D.; F. L. Hoffman; Chas. Edward A. Winslow. Committee on Publication, Davis R. Dewey, Ph.D.; John Koren; Edward M. Hartwell, M.D. Committee on Finance, Osborne Howes; Walter C. Wright; S. B. Pearmain. Committee on Library, Hon. Julius L. Clarke; Rev. Samuel W. Dike, LL.D.; W. Z. Ripley, Ph.D. (See also AMERICAN SOCIAL SCIENCE ASSOCIATION and INTERNATIONAL STATISTICAL INSTITUTION.)

ANABAPTISTS: A religious community that arose principally in Germany in the sixteenth century, opposing the baptizing of infants (whence their name), but better known for their revolutionary and communistic social efforts. Thomas Munzer (1520), the leader of a set of enthusiasts called the prophets of Zwickau, did much to spread the beliefs of Anabaptism through Saxony and Switzerland. Waldshut became one of their centers of propagation. Revolting from the rigid rule of the state and from the false formalism of the Church, they carried their principles too far, and it is certain that in some places the movement, guided by ambitious and licentious men, broke into lawlessness and lust. But for the most part the Anabaptists have been a maligned and misrepresented class of people, who earnestly desired and sought for a greater fulness of truth and brotherhood than any institutions under the then existing conditions provided. Their doctrines were: The equality of all Christians, the community of goods, the baptism of the Spirit, adult baptism, and the establishment of the kingdom of heaven on earth. About 1525 the "Peasant War" broke out, partially caused and largely supported by these doctrines. The laboring classes were at this time cruelly opprest by the government, and the teachings of Anabaptism spread rapidly through Holstein, Westphalia, and the Netherlands. Again and again they were checked, and scattered, and persecuted even to death; but traveling preachers continued the agitation, and organizations sprang up wherever persecution turned its back.

History

In 1534 they became masters of Münster; they destroyed churches and appointed twelve judges to rule over the city. A tailor named Jan van Leiden had himself crowned king, and for a year the city was given over to every kind of madness and licentiousness. At the end of that time several Protestant princes conquered the city and restored peace and order by executing the ringleaders of the uproar. In Amsterdam and other cities, however, Anabaptists, who had little in common with the lustful fanaticism of Buckhold, spread their doctrines. The Revelations of St. John was their chief source of doctrine; and their main desire was to found a new kingdom of pure and primitive Christianity. David Joris (1501–56), one of the chief of these, united liberalism with anabaptism, introduced much mystical theology, and strove to unite the different Christian sects. Another prominent leader was Menno Simons. In spite of dangers and persecutions he gathered together the scattered and disheartened Anabaptists of Germany and the Netherlands, known in the United States as "Mennonites." He explained his belief in a book published in 1556, "Elements of the True Christian Faith," which is still an authoritative book among the Mennonites. His adherents believe in strictly following the teachings of Scripture, in rejecting the taking of oaths, every kind of revenge, war, divorce (except for adultery), infant baptism, and the undertaking the work of a magistrate. Their belief is that while magistracy is necessary for the present time, it is foreign to the kingdom of Christ. The education and theology of the colleges they set very little value upon. Menno called his adherents "God's congregation; poor, unarmed Christian brothers." In Germany the Mennonites are called *Taufgesinnte*, and in Holland, *Doopsgezinden*.

The church is a literal communion of the saints, which must be kept pure by strict discipline.

They celebrate the rite of feet-washing. Their bishops, elders, and teachers serve gratis. They are split into many divisions, mainly the strict and the mild Mennonites. The latter are known as Wäterlanders, from a place in Holland. Some of their divisions take names from the peculiarities of their dress—Buttoners, Hook-and-eye-ers, etc. The purity of their lives, however, commands respect, and their industry makes them prosperous.

ANARCHISM (Gr. *αν*, privative, and *ἀρχή*, government): The social doctrine of the abolition of government of man by man, and the constitution of society without government. In this article the subject is considered under three heads: (1) Individualist or Philosophical Anarchism; (2) Anarchist Communism; and (3) Arguments against Anarchism.

Under the general definition there are two schools of anarchists, totally distinct and even opposed in their doctrines, methods, and in their general characteristics. The two schools are those of the individualist anarchists (often called in this country philosophical anarchists), and, secondly, the school of anarchist communists, a school which, however, is gradually dying out, and which the more thoughtful anarchists deny to be anarchism at all. The individualist anarchists, tho the fewer in number, are, in this country especially, the abler body of thinkers, and carry to their fullest logical results the principles which a great many individualists accept but do not carry out. Individualist anarchists do not believe in the use of force—not because they hold that it is wrong to use it, but because they are aware that the use of force never truly liberates, while their aim is absolute liberty—their motto being "Liberty, not the daughter, but the mother of order." They start from the philosophy of individual sovereignty, and apply it to the problems of social science with relentless logic. By no means objecting to organization and cooperation, provided it be voluntary, they would have all organization spring from the individual.

Anarchist communists, on the other hand, form a wholly different school of thought. They do not believe in government, and they do believe in overthrowing it by force. On its ruins they would plant a communal life, whose ideal is very little different from that of the Socialists, except that it is not to be realized through the state. Most of the men who are called anarchists in the press, particularly of Europe, and almost all the bomb-throwers and dynamiters of recent years on either continent have been anarchist communists. This school is mainly European, while individualist anarchism is mainly American. Anarchist-communism counts among its followers names favorably known to science and letters, such as Krapotkin and Réclus, while many, even of the dynamitards, have been men of education and sometimes refinement. Nevertheless, it is mainly a movement among the working classes, particularly of France, Italy, Spain, and to a less extent, Germany and Austria. In England there are but few anarchist communists. In America they are found only in a few cities. The so-called Chicago anarchists were anarchist communists. Individualist anarchism, on the other hand, is not a class movement, but almost purely intellectual, naturally drawing its strength largely from the classes possessed to-day of intellectual advantages. It will thus be seen that in philosophy, method, and general characteristics the two classes of anarchists are carefully to be distinguished. Both are distinctly revolutionary and opposed to the state; but the one starts from the individual, and advocates a revolution through ideas; the other starts from the community, and advocates a revolution through force. We print a statement of individualist anarchism by Victor S. Yarros, former associate editor of *Liberty*, and a statement of anarchist communism by Pierre Krapotkin, perhaps its most distinguished representative. Mr Yarros writes:

I.—Individualist or Philosophical Anarchism

Definition and Statement

The individualistic or philosophical anarchists favor the abolition of "the state" and government of man by man. They seek to bring about a state of political freedom—of anarchy. To comprehend the precise import of this statement it is essential to grasp and bear in mind the definitions given by the anarchists to the terms employed in their expositions. The current misconceptions of the anarchistic doctrines are chiefly due to the persistent, tho largely unconscious, habit of interpreting them in the light of the popular definitions of the terms "state," "government," etc., instead of in the light of their own technical use of these terms. The average man on being told that the anarchist would abolish all governmental restraints, not unnaturally concludes that the proposition involves the removal of the restrictions upon *criminal* conduct, the relinquishment of organized defense of life, liberty, and property. Those who are familiar with the doctrine of non-resistance to evil, preached by the early Christians and by the modern Tolstoïans, generally identify anarchism with it. But such interpretations are without any foundation. The anarchists are emphatically in favor of resistance to and organized protection against crime and aggression of every kind; it is not greater freedom for the criminal, but greater freedom for the non-criminal, that they aim to secure; and by the abolition of government they mean the removal of restrictions upon conduct intrinsically ethical and legitimate, but which ignorant legislation has interdicted as criminal. The anarchistic principle of personal liberty is absolutely coincident with the famous Spencerian "first principle of human happiness," the principle of "equal freedom," which Mr. Spencer has exprest in the formula, "Every man is free to do what he wills, provided he infringes not the equal freedom of any other man." It is, in fact, precisely *because* the anarchist accepts this principle without reservation, and insists on the suppression and elimination of *all* aggression or invasion—all conduct incompatible with equality of liberty—that he declares war upon the "state" and "government." He defines "state" as "the embodiment of the principle of invasion in an individual or band of individuals, assuming to act as representatives or masters of the entire people within a given area." * Government he

* The definitions here given are those formed and consistently used by Benjamin R. Tucker, the editor of *Liberty*, the organ of the philosophical anarchistic movement.

defines as "the subjection of the non-invasive individual to an external will"; and "invasion" as conduct violative of equal freedom.

Program

Perhaps the clearest way of stating the political program of the anarchists will be to indicate its relation to other and better-known theories of government. The anarchists, agreeing with the view of the true Jeffersonian Democrats, that the best government is that which governs least, sympathizing with the position of the old Manchester individualists and *laissez-faire-ists*, who believed in a minimum of government interference, as well as with the less vague doctrines of the more radical modern individualists of the Spencerian school, who would limit the state to the sole function of protecting men against external and internal invaders, go a step farther and demand the dissolution of what remains of "government" —viz., compulsory taxation and compulsory military service. It is no more necessary, contend the anarchists, that government should assume the protective military and police functions, and *compel* men to accept its services, than it is that government should meddle with production, trade, banking, education, and other lines of human activity. By voluntary organization and voluntary taxation it is perfectly possible to protect liberty and property and to restrain crime. It is doubtless easy to imagine a society in which government concerns itself with nothing save preservation of order and punishment of crime, in which there are no public schools supported by compulsory taxation, no government interference with the issue of currency and banking, no custom-houses or duties on foreign imports, no government postal service, no censorship of literature and the stage, no attempt to enforce Sunday laws, etc. The *laissez-faire-ists* of the various schools have familiarized the thinking public with such a type of social organization. The anarchists simply propose to do away with the compulsory feature of the single function reserved for government by the radical *laissez-faire-ists*. In other words, they insist on the right of the non-aggressive individual to "ignore the state," to dispense with the protective services of the defensive organization and remain outside of it. This would not prevent those who might desire systematic and organized protection from combining to maintain a defensive institution, but such an institution would not be a government, since no one would be compelled to join it and pay toward its support. Anarchy, therefore, may be defined as a state of society in which the non-invasive individual is not coerced into cooperation even for the defense of his neighbors, and in which each enjoys the highest degree of liberty compatible with equality of liberty.

With regard to the question of putting down aggression, the jurisdiction of the voluntary defensive organization would of course extend to outsiders, and not be limited by its membership. The criminal are not to secure immunity by declining to join defensive associations. As the freedom of each is to be bounded by the equal freedom of all, the invader would be liable to punishment under anarchism no less than under government. Criminals would still be tried by juries and punished by executive officers. They would not be allowed to set up ethical standards for themselves and to do what is right in their own eyes. Such a doctrine involves not the *abolition* of government, but the widest possible extension of it. It repudiates all ethical principles and abandons all attempts at enforcing justice and protecting rights. Every man is allowed under it to govern his fellows, if he has the will and the power, and the struggle for existence in the simplest and crudest form is revived. Anarchism, on the other hand, posits the principle of equal liberty as binding upon all, and only insists that those who refrain from violating it should not be interfered with in any way, either by individual governors or combinations of would-be rulers.

Arguments for Anarchism

Anarchists reject governmentalism because they find no ethical warrant and no practical necessity for it. It appears to them self-evident that society, or the community, can have no greater claims upon the individual than the component members of it have. The metaphysical and misleading analogies between society and organism, upon which is usually founded the governmentalist's theory of the prerogatives of the state, anarchists reject with undisguised contempt. "The community," or "the state," is an abstraction, and an abstraction has neither rights nor duties. Individuals, and individuals only, have rights. This proposition is the corner-stone of the anarchistic doctrine, and those who accept it are bound to go the full length of anarchism. For if the community cannot rightfully compel a man to do or refrain from doing that which private and individual members thereof cannot legitimately force him to do or forego, then compulsory taxation and compulsory cooperation for any purpose whatever are wrong in principle, and government is merely another name for aggression. It will not be pretended that one private individual has the right to tax another private individual without his consent; how, then, does the majority of the members of a community obtain the right to tax the minority without its consent? Having outgrown the dogma of the divine right of kings, democratic countries are unconsciously erecting the dogma of the divine right of majorities to rule. The absurdity of such a belief is apparent. Majorities, minorities, and any other combinations of individuals are entitled to insist on respect of their rights, but not on violating the rights of others. There is one ethical standard, not two; and it cannot be right for government to do that which would be criminal or immoral when committed by individuals. Laws of social life are not made at the polls or in legislative assemblies; they have to be discovered in the same way in which laws of other sciences are discovered. Once discovered, majorities are bound to observe them no less than individuals.

No Ethical Warrant for Government

As already stated, the anarchists hold that the law of equal freedom, formulated positively by Spencer and negatively by Kant, is a scientific social law which ought to guide men in their various activities and mutual relations. The logical deductions or corollaries of this law show us at once our rights and our duties. Government violates this great law not only by the fact of its very existence, but in a thousand other ways. Government means the coercion of the non-invasive, the taxation of those who protest against being forced to join the political organization set up by the majority. It enacts statutes and imposes restraints which find no sanction in

the law of equal freedom, and punishes men for disobeying such arbitrary provisions. It is true that governments profess to have the public welfare in view, and to enforce nothing save what morality and justice dictate. Justice, however, is invariably confounded by governments with legalism, and by the enforcement of justice they often mean the enforcement of the very laws which they enact in violation of justice. Thus laws in restraint of trade and of exchange are enforced in the name of justice, whereas justice demands the fullest freedom of trade and exchange. Strictly speaking, the enforcement of justice cannot be undertaken by government at all, since a government that should attempt to enforce justice would have to begin by signing its own death-warrant. A government that would enforce equal freedom and let the inoffensive alone would be, not a government, but a voluntary association for the protection of rights.

In republican countries men loosely speak of their "free government," their "government by consent." In reality there is no such thing as government by consent. Majorities rule, and the minorities are forced to acquiesce. The principle of consent is clearly fatal to governmentalism, for it implies the right of the non-invasive to ignore the state and decline to accept its services. Ethically a man has a perfect right to do this, for the mere refusal to join the political organization (which is merely an insurance association) is not a breach of the principle of equal freedom. Our "free governments" deny this right, hence they are immoral. They cannot become moral except by ceasing to be governments and becoming purely voluntary associations for defense.

Apart from the question of compulsory taxation and compulsory military service, on the abolition of which anarchists alone lay stress (altho they readily admit that the police functions of government will be the last to disappear), there is little, if any, difference between anarchists and Spencerian individualists, on the question of government interference. The cessation of such interference with economic relations —with the issue of money, banking, wages, trade, production, etc.—is advocated on the ground that the solution of the social problems is to be found in liberty rather than in regulation, in free competition rather than in state monopoly. Anarchists are opposed to trusts and monopolies, but they would not substitute public for private monopoly. All monopoly rests on legal privilege, on injustice, on violations of equal opportunity, and therefore the anarchist demands equality of opportunity and free competition rather than restrictive, paternalistic regulation of industry and commerce. On the subject of public education, postal service, poor laws, sanitary supervision, etc., anarchists, in common with advanced individualists, hold that government interference is as pernicious practically as it is unwarranted ethically. Corruption and inefficiency are evils inseparable from government management, and there is nothing which government does that could not be done better by private enterprise under free competition.

In short, the anarchists object to governmentalism because it is unethical, as well as unnecessary and inexpedient. Government is either the will of one man or the will of a number of men, large or small. Now, the will of one or many is not a criterion of right and justice, while for the adjustment of the conflicting interests of the members of society such a criterion is an absolute necessity. Majority rule, and even the rule of a despot, may be, under certain conditions, preferable to a state of civil chaos; but as men advance and study the facts of their own development, they begin to realize the truth that there is no relation whatever between right and numbers, justice and force. Majority rule is discredited along with despotic rule, and ethical science becomes the sole guide and authority. The social laws need to be applied and enforced as long as predatory instincts and invasive tendencies continue to manifest themselves in human relations, and this necessitates the maintenance of associations for the protection of freedom and the punishment of aggression. But the governmental method is not adapted to the promotion of this end. Government begins by coercing the non-invasive individual into cooperation for defense and offense, regardless of the fact that a benevolent despotism is not a whit more defensible than a selfish despotism.

Majority Rule Discredited

In general, it may be stated that any methods not in themselves invasive are regarded as legitimate by the anarchists in the furtherance of their cause. But they rely chiefly, if not entirely, on the methods of education—theoretical propaganda of their views—and of passive resistance to government. In violence, so-called propaganda by deed and subterranean plotting against existing institutions, they do not believe. Political changes may be brought about by revolutions, and possibly also such economic changes as are contemplated by the state Socialists. But freedom can rest only on ideas and sentiments favorable to it, and revolutionary demonstrations can never abolish ignorance and the spirit of tyranny. Freedom cannot be forced on those who are not fit for it. The emancipation of the people from the aggression of government must come through their own deliberate choice and effort. Anarchists can but disseminate true political teachings and expose the nature and essence of governmentalism. Anarchists, however, do not believe that it is necessary to convert the whole people in order to carry their principles into practise. A strong and determined minority could, while remaining passive, successfully resist the attempt of government to tax them and otherwise impose its will upon them. Public opinion would not approve of a government campaign of violence against a number of intelligent and perfectly honest individuals banded together for the sole purpose of carrying on their legitimate activities and asserting their right to ignore injunctions and prohibitions having no authority from an ethical point of view.

Methods

Even if anarchists believed in the use of violent methods—and if they thought that violent resistance to government would hasten their emancipation, they would certainly resort to it, since it is not immoral or invasive to use force *against* invaders—there would be one important difference between them and other schools of reformers. Anarchists would not prevent others from living under government side by side with them, while other reformers seek to impose their schemes on the whole community in which they live. Thus the state Socialists, in pursuance of their program of state monopoly of capital, intend to suppress all competition and all rivalry on the part of individual owners of

capital. The anarchists, on the other hand, if allowed to remain outside of the governmental organization, would force no one to join them or follow their example. Still, as a matter of fact, anarchists abjure violence even in their own interests, vividly realizing the truth that the progress of justice and freedom is arrested in a state of war. Peace is an essential condition to the spread of rational ideas and the growth of the sentiment of toleration. Appealing as they do to the ideas and feelings of justice, it would be suicidal for anarchists to encourage violence and excite the lowest passions of men by revolutionary tactics.

To reform by ordinary political methods the anarchists are also opposed, at least under present conditions. As they do not seek any new positive legislation, they can expect nothing from politics. They demand the repeal of the legislation which improperly restricts men's freedom of action, and such repeal they cannot secure while being in a minority. Whether they would cooperate with other parties in attempting to carry specific measures of repeal, would depend largely on circumstances. It is to be remembered that, while the anarchists are strenuous in their opposition to every vestige of government, they do not expect to realize their entire program at one stroke. They are prepared for very slow and gradual reform, and would welcome the success of any single libertarian proposal. They would rejoice in the triumph of the free-trade idea, the repeal of the laws perpetuating land monopoly and monetary monopoly, and the abolition of special privileges. If they do not form themselves into a political party for the purpose of attaining one or more of these objects, it is because they can do more by other methods. Moreover, to enter into the political arena is to recognize, by implication, the principle of government. To vote is to coerce or to threaten coercion. Behind the ballot is the bullet of the soldier, ready to force the defeated minority into submission. The voter does not merely assert his right to self-government; he sets up a claim to govern others. The anarchist cannot employ a method which would put him in such a false light.

Thus the anarchist is neither a government bomb-thrower nor a revolutionary bomb-thrower. He objects to the use of violence by the government as well as against it. He restricts himself to the method of education and such passive resistance as is exemplified by a refusal to pay taxes or rent or import duties on commodities purchased in foreign countries.

Historical Sketch of Individualist Anarchism

Philosophical anarchists usually regard Proudhon as the founder of their school of social science; but there were in America, altho far less widely known, men entertaining anarchistic views before Proudhon's time. We will, therefore, first notice the anarchist movement in America, and then consider it in other countries. America, or at least the United States, with its early extreme individualism and fear of the state (see Centralization), was the fitting birthplace of anarchistic thought.

Josiah Warren

Josiah Warren, a plain and only moderately educated New Englander, but a man of unusually independent and earnest spirit, was probably the first to enunciate precise anarchistic conceptions. He had become interested in the social views and plans of Robert Owen, at this time first taking root in the land; had joined the Owenite community at New Harmony; had carefully studied its principles and mused upon its failure, till finally, about 1828, he reached the conclusion that its principles were exactly the opposite of the true ones, and that instead of the communistic idea of each working for all, as Owen taught, the true way to produce order, harmony, and well-being was for each to live, in his own way, absolutely untrammeled by others, so far as he did not intrude upon the similar privileges of others. His thoughts took especially a financial turn, and he came to the conclusion that cost was the true limit of price; that usury and profit in all their forms were, therefore, economically wrong, and, moreover, that they would disappear under perfectly free competition. He sought to put his ideas into practise, to actually test them before giving them to the world, and therefore started, and for two years successfully carried on, a store in Cincinnati, where cost was the limit of price, and where usury and profit were eliminated. Finding that he was doing a business of $150,000 a year—a large amount for Cincinnati in those days—he was convinced of the practicality and correctness of his idea, and therefore closed his business to devote his life to the propagation of his ideas. His main writings were "True Civilization," a short work, first published in 1846, and "Equitable Commerce," in which he elaborated his ideas of cost as the limit of price. These books found at least a few thoughtful readers. Stephen Pearl Andrews declared at a later day that the "True Civilization" was the text and basis of all his own writings, and John Stuart Mill refers to Warren with expressions of deepest interest and respect.

Other Americans

Others, however, were thinking in the same line. Lysander Spooner may be called the Nestor of anarchism, of the extreme individualistic school. Commencing public life as a young lawyer in Worcester, Mass., he first showed strong analytic and argumentative powers in several pamphlets defending Deism against Christianity, but soon passed more and more into sociological studies and controversy, coming to hold and defend extreme views as to individual sovereignty and the tyranny of the state. As early as 1844 he established a private mail between Boston and New York, and later extended it to Philadelphia and Baltimore, achieving success, until at last compelled to stop, owing to petty and constant persecution and annoyance from the government. From that time he devoted his great abilities to the promulgation of his ideas. During the antislavery contest he did good work as an abolitionist, and incorporated his views in "The Unconstitutionality of Slavery." His legal acumen appears in his "Trial by Jury," in which he reverts to the early and true meaning of the phrase—a trial by one's peers; and protests against the absurd and monstrous system (as he claims it to be) of ignorance and injustice now passing under that name. How far he carried his ideas appears in an unsigned monograph from his pen, entitled "Revolution."

Stephen Pearl Andrews was a disciple of Warren. As Warren especially studied economic questions, so Andrews studied the family and marriage. His "Science of Society," published in 1850, is still considered by philosophical anarchists a classic on the subject. Warren himself declared it a better statement of his own ideas than he himself could write. (For further account, see Andrews.)

We now first come to the influence of Proudhon in America. Col. William B. Greene, of Boston, being the first in this country known to have declared himself a follower of the great Frenchman. Colonel Greene's book on "Mutual Banking" is one of the most acute and searching inquiries into the monetary problems to be found in the literature on the subject. Colonel Greene was a keen, logical thinker and a profound scholar. He was a remarkably witty speaker and writer, and his book, entitled "Socialistic, Communistic, Mutualistic, and Financial Fragments," shows his power and versatility. E. H. Heywood, a writer on various subjects, was another disciple of Warren. He is the author of a number of very able pamphlets. Charles T. Fowler, also a disciple of Warren, was a Unitarian minister when he first fell under the influence of Warren. He studied Proudhon, and after leaving the church devoted himself to the propaganda of anarchistic doctrines. He died leaving an admirable series of pamphlets on social and economic problems.

Present Writers

These men, however, while holding essentially anarchist views, and contributing, severally, to the development of anarchism in the United States, did not adopt the name anarchist, and did not really start the movement which has taken such definite shape under that distinctive denomination. The man who, assimilating and profiting by the teachings of Proudhon Warren, Greene, and the American and English individualists, formulated a consistent and comprehensive anarchistic philosophy, and started the practical anarchistic movement is Benjamin R. Tucker, the editor of *Liberty*, the organ of anarchism. Mr. Tucker was a young man, a student of the Massachusetts Institute of Technology, when he, becoming interested in social reform, sought the acquaintance of Warren and Greene. The latter called his attention to Proudhon's "What is Property?" and so impressed was he with the originality and value of that revolutionary (in an intellectual sense) and epoch-making work, that he set himself the task of translating it into English. No work has ever enjoyed the privilege of a more competent rendering into another language. The vigor and eloquence of Proudhon's style was fully preserved in the translation, and to this is due a large share of the influence exerted by Proudhon's work in America and England. A few years later Mr. Tucker started his periodical, *Liberty*, which has been for more than two

decades the recognized authority on anarchism. Mr. Tucker does not strictly follow Proudhon, any more than he strictly follows Warren. He rejects the inconsistencies of the former as he does the crudities of the latter. He may be said to have *organized* the various anarchistic ideas—economic, political, etc.—into a coherent and systematic whole. Where Proudhon was vague and Warren inadequate, Mr. Tucker is clear, logical, consistent, and scientific. Mr. Tucker has influenced a considerable number of able men in journalism and other professions, as well as some of the prominent men in the labor movement. We will only mention here the name of Dyer D. Lum, one of the leaders of the early Greenback movement. Mr. Lum, while sympathizing to some extent with the methods of revolutionary reformers, was for several years before his death a vigorous and scholarly champion of the economic and political ideas of anarchism.

The growth of anarchism has not been rapid, and its history is not eventful or sensational. Its indirect influences, however, have wrought great changes in social science and in the intellectual attitude of sociologists and reformers.

In Europe, the real history of philosophic anarchism begins with PROUDHON. We study him here but in brief, in relation to the movement of anarchism. Born in 1809, after a bitter personal experience with poverty and ill-paid work, he published in 1840 his great work, "What is Property?" Of this an admirer says: "He first with genius, and with learning and acumen rarely equaled, pleaded for absolute liberty of the individual and the doing away with all government. Property in its modern sense he showed to be, not the product of individual labor on the part of the owner of the property, but the product of the labor of others, taken from them by legalized wrong, or by aid of monopolies and class legislation created by the State. Hence the truth of his celebrated sentence, 'Property is theft.' The cure, he argued, was to do away with all government, and then each individual could retain that which he had produced, so that justice and order and well-being would be the result of liberty."

Europe

The book exposed him to new persecution from the government and learned societies, which continued more or less to his death in 1865. He passed much of his life in Belgium, banished from France. Yet he was ever active and at times popular in France. He was elected in 1848 to the Constituent Assembly by 77,000 votes, which, together with his frequent imprisonments and banishments, as well as the suppression of his books, shows his power and influence in his generation. Yet few followed him understandingly. Proudhon himself declared that even those who voted for him did not understand his views. He believed that in America (as seems to be the case) his thoughts would first take root. His principal writings besides the above-named are: "The Creation of Order in Humanity" (1843); "A System of Economical Contradictions" (1848); "Justice in the Revolution and in the Church" (1858); "Justice" (revised edition, 1859–60).

Proudhon was right; few followed him understandingly. The movement that sprang from his teachings has in the main, in Europe, been anarchist communism, which is no more like philosophic anarchism than Proudhon was like Bakounin. The real followers of Proudhon and philosophical anarchism, in Europe, can almost be counted on one's fingers, tho their influence has been more marked than this might seem to indicate.

In Germany Caspar Schmidt, better known under his *nom de plume* of Max Stirner, laid what some regard as the ethical foundations of anarchism in his "Der Einzige und sein Eigenthum" (1845). John Henry Mackay, a Scotchman by birth, but with a German mother, and brought up in Germany from boyhood, has developed philosophic anarchism in poems, a novel ("The Anarchists," translated into English, 1891), and other works. In England philosophic anarchism under this name has had scarcely any development at all; but perhaps this is only because so much of its individualism, of which there has been considerable development, has come so near to philosophic anarchism in such writers as Herbert Spencer, Auberon Herbert, Wordsworth Donisthorpe, Thomas Mackay, Frederick Millar, and others.

II.—Anarchist Communism

The following statement of anarchist communism is abridged from a tract on "The Place of Anarchism in Socialistic Evolution," by Pierre A. Kropotkin:

"All things belong to all, and provided that men and women contribute their share of labor for the production of necessary objects, they are entitled to their share of all that is produced by the community at large. 'But this is communism,' you may say. Yes, it is communism, but it is the communism which no longer speaks in the name of religion or of the State, but in the name of the people. . . . The tendency of this closing century is toward communism, not the monastic or barrack-room communism formerly advocated, but the free communism which places the products reaped or manufactured in common at the disposal of all, leaving to each the liberty to consume them as he pleases in his own home.

"This is the solution of which the mass of the people can most readily take hold, and it is the solution which the people demand at the most solemn epochs. In 1848 the formula 'From each according to his abilities, to each according to his needs' was the one which went straight to the heart of the masses, and if they acclaimed the republic and universal suffrage, it was because they hoped to attain to communism through them. In 1871, also, when the people besieged in Paris desired to make a supreme effort to resist the invader, what was their demand? That free rations should be served out to every one. Let all articles be put into one common stock and let them be distributed according to the requirements of each. Let each one take freely of all that is abundant, and let those objects which are less plentiful be distributed more sparingly and in due proportions—this is the solution which the mass of the workers understand best. This is also the system which is commonly practised in the rural districts (of France). So long as the common lands afford abundant pasture, what commune seeks to restrict their use? When brushwood and chestnuts are plentiful, what commune forbids its members to take as much as they want? And when the larger wood begins to grow scarce, what course does the peasant adopt? The allowancing of individuals.

France

"Let us take from the common stock the articles which are abundant, and let those objects whose production is more restricted be served out in allowances according to requirements, giving preference to children and old persons—that is to say, to the weak. And, moreover, let all be consumed not in public, but at home, according to individual tastes and in company with one's family and friends. This is the ideal of the masses.

"But it is not enough to argue about 'communism' and 'expropriation'; it is furthermore necessary to know who should have the management of the common patrimony, and it is especially on this question that different schools of Socialists are opposed to one another, some desiring authoritarian communism, and others, like ourselves, declaring unreservedly in favor of anarchist communism. In order to judge between these two, let us return once again to our starting point, the revolution of the last century.

"In overturning royalty the Revolution proclaimed the sovereignty of the people; but, by

an inconsistency which was very natural at that time, it proclaimed not a permanent sovereignty, but an intermittent one, to be exercised at certain intervals only, for the nomination of deputies supposed to represent the people. In reality it copied its institutions from the representative government of England. The Revolution was drowned in blood, and, nevertheless, representative government became the watchword of Europe. All Europe, with the exception of Russia, has tried it, under all possible forms, from government based on a property qualification to the direct government of the little Swiss republics. But, strange to say, just in proportion as we have approached nearer to the ideal of a representative government, elected by a perfectly free universal suffrage, in that same proportion have its essential vices become manifest to us, till we have clearly seen that this mode of government is radically defective. Is it not, indeed, absurd to take a certain number of men from out the mass, and to intrust them with the management of *all* public affairs, saying to them, 'Attend to these matters; we exonerate ourselves from the task by laying it upon you; it is for you to make laws on all manner of subjects—armaments and mad dogs, observatories and chimneys, instruction and street-sweeping; arrange these things as you please and make laws about them, since you are the chosen ones whom the people have voted capable of doing everything'? It appears to me that if a thoughtful and honest man were offered such a post he would answer somewhat in this fashion:

"'You intrust me with a task which I am unable to fulfil. I am unacquainted with most of the questions upon which I shall be called on to legislate. I shall either have to work to some extent in the dark, which will not be to your advantage, or I shall appeal to you and summon meetings in which you will yourselves seek to come to an understanding on the questions at issue, in which case my office will be unnecessary. If you have formed an opinion and have formulated it, and if you are anxious to come to an understanding with others who have also formed an opinion on the same subject, then all you need do is to communicate with your neighbors and send a delegate to come to an understanding with other delegates on this specific question; but you will certainly reserve to yourselves the right of taking an ultimate decision; you will not intrust your delegate with the making of laws for you. This is how scientists and business men act each time that they have to come to an agreement.'

Argument

"But the above reply would be a repudiation of the representative system, and nevertheless it is a faithful expression of the idea which is growing everywhere since the vices of representative government have been exposed in all their nakedness. Our age, however, has gone still further, for it has begun to discuss the rights of the State and of society in relation to the individual; people now ask to what point the interference of the State is necessary in the multitudinous functions of society.

"Do we require a government to educate our children? Only let the worker have leisure to instruct himself, and you will see that, through the free initiative of parents and of persons fond of tuition, thousands of educational societies and schools of all kinds will spring up, rivaling one another in the excellence of their teaching. If we were not crusht by taxation and exploited by employers, as we now are, could we not ourselves do much better than is now done for us? The great centers would initiate progress and set the example, and you may be sure that the progress realized would be incomparably superior to what we now attain through our ministries. Is the State even necessary for the defense of a territory? If armed brigands attack a people, is not that same people armed with good weapons the surest rampart to oppose to the foreign aggressor? Standing armies are always beaten by invaders, and history teaches that the latter are to be repulsed by a popular rising alone. While government is an excellent machine to protect monopoly, has it ever been able to protect us against ill-disposed persons? Does it not, by creating misery, increase the number of crimes instead of diminishing them? In establishing prisons into which multitudes of men, women, and children are thrown for a time, in order to come forth infinitely worse than when they went in, does not the State maintain nurseries of vice at the expense of the taxpayers? In obliging us to commit to others the care of our affairs, does it not create the most terrible vice of societies—indifference to public matters? . . .

No Need of the State

"Let others, if they will, advocate industrial barracks or the monastery of authoritarian communism, we declare that the tendency of society is in an opposite direction. We foresee millions and millions of groups freely constituting themselves for the satisfaction of all the varied needs of human beings—some of these groups organized by quarter, street, and house; others extending hands across the walls of cities over frontiers and oceans. All of these will be composed of human beings who will combine freely, and after having performed their share of productive labor will meet together, either for the purpose of consumption, or to produce objects of art or luxury, or to advance science in a new direction. This is the tendency of the nineteenth century, and we follow it; we only ask to develop it freely without any governmental interference. Individual liberty! 'Take pebbles,' said Fourrier, 'put them into a box and shake them, and they will arrange themselves in a mosaic that you could never get by intrusting to any one the work of arranging them harmoniously.

"Now let me pass to another part of my subject—the most important with respect to the future.

"There is no more room for doubting that religions are going; the nineteenth century has given them their death-blow. But religions—all religions—have a double composition. They contain, in the first place, a primitive cosmogony, a rude attempt at explaining nature, and they furthermore contain a statement of the public morality born and developed within the mass of the people. But when we throw religions overboard or store them among our public records as historical curiosities, shall we also relegate to museums the moral principles which they contain? This has sometimes been done, and we have seen people declare that as they no longer believed in the various religions, so they despised morality and boldly proclaimed the maxim of *bourgeois* selfishness, 'Every one for himself.' But a society, human or animal, cannot exist without certain rules and moral habits springing up within it; religion may go, morality remains.

If we were to come to consider that a man did well in lying, deceiving his neighbors, or plundering them when possible (this is the middle-class business morality), we should come to such a pass that we could no longer live together. You might assure me of your friendship, but perhaps you might only do so in order to rob me more easily; you might promise to do a certain thing for me, only to deceive me; you might promise to forward a letter for me, and you might steal it, just like an ordinary governor of a jail. Under such conditions society would become impossible, and this is so generally understood that the repudiation of religions in no way prevents public morality from being maintained, developed, and raised to a higher and ever higher standard. This fact is so striking that philosophers seek to explain it by the principles of utilitarianism, and recently Spencer sought to base the morality which exists among us upon physiological causes and the needs connected with the preservation of the race.

Ethical Side

"Let me give you an example in order to explain to you what *we* think on the matter.

"A child is drowning, and four men who stand upon the bank see it struggling in the water. One of them does not stir; he is a partizan of 'Each one for himself,' the maxim of the commercial middle class; this one is a brute, and we need not speak of him further. The next one reasons thus: 'If I save the child, a good report of my action will be made to the Ruler of heaven, and the Creator will reward me by increasing my flocks and my serfs,' and thereupon he plunges into the water. Is he, therefore, a moral man? Clearly not! He is a shrewd calculator, that is all. The third, who is a utilitarian, reflects thus (or at least utilitarian philosophers represent him as so reasoning): 'Pleasures can be classed in two categories, inferior pleasures and higher ones. To save the life of any one is a superior pleasure, infinitely more intense and more durable than others; therefore, I will save the child.' Admitting that any man ever reasoned thus, would he not be a terrible egotist? and, moreover, could we ever be sure that his sophistical brain would not at some given moment cause his will to incline toward an inferior pleasure—that is to say, toward refraining from troubling himself? There remains the fourth individual. This man has been brought up from his childhood to feel himself *one* with the rest of humanity; from his childhood he has always regarded men as possessing interests in common; he has accustomed himself to suffer when his neighbors suffer, and to feel happy when every one around him is happy. Directly he hears the heartrending cry of the mother, he leaps into the water, not through reflection, but by instinct; and when she thanks him for saving her child, he says, 'What have I done to deserve thanks, my good woman? I am happy to see you happy; I have acted from natural impulse, and could not do otherwise!'

"You recognize in this case the truly moral man, and feel that the others are only egotists in comparison with him. The whole anarchist morality is represented in this example. It is the morality of a people which does not look for the sun at midnight—a morality without compulsion or authority, a morality of habit. Let us create circumstances in which man shall not be led to deceive nor exploit others, and then by the very force of things the moral level of humanity will rise to a height hitherto unknown. Men are certainly not to be moralized by teaching them a moral catechism; tribunals and prisons do not diminish vice—they pour it over society in floods. Men are to be moralized only by placing them in a position which shall contribute to develop in them those habits which are social, and to weaken those which are not so. A morality which has become instinctive is the true morality, the only morality which endures while religions and systems of philosophy pass away.

"Let us now combine the three preceding elements, and we shall have anarchy and its place in socialistic evolution.

"Emancipation of the producer from the yoke of capital; production in common and free consumption of all the products of the common labor.

"Emancipation from the governmental yoke; free development of individuals in groups and federations; free organization ascending from the simple to the complex, according to mutual needs and tendencies.

"Emancipation from religious morality; free morality, without compulsion or authority, developing itself from social life and becoming habitual.

"The above is no dream of students, it is a conclusion which results from an analysis of the tendencies of modern society; anarchist communism is the union of the two fundamental tendencies of our society—a tendency toward economic equality and a tendency toward political liberty. So long as communism presented itself under an authoritarian form, which necessarily implies government, armed with much greater power than that which it possesses to-day, inasmuch as it implies economic in addition to political power—so long as this was the case communism met with no sufficient response. Before 1848 it could, indeed, sometimes excite for a moment the enthusiasm of the worker who was prepared to submit to any all-powerful government, provided it would release him from the terrible situation in which he was placed, but it left the true friends of liberty indifferent.

Fundamental Tendencies

"Anarchist communism maintains that most valuable of all conquests—individual liberty—and moreover extends it and gives it a solid basis—economic liberty—without which political liberty is delusive; it does not ask the individual who has rejected God, the universal tyrant, God the king, and God the Parliament, to give unto himself a god more terrible than any of the preceding—God the community, or to abdicate upon its altar his independence, his will, his tastes, and to renew the vow of asceticism which he formerly made before the crucified God. It says to him, on the contrary, 'No society is free so long as the individual is not so! Do not seek to modify society by imposing upon it an authority which shall make everything right; if you do, you will fail as popes and emperors have failed. Modify society so that your fellows may not be any longer your enemies by the force of circumstances; abolish the conditions which allow some to monopolize the fruit of the labor of others; and instead of attempting to construct society from top to bottom, or from the center to the circumference, let it develop itself freely from the simple to the composite, by the free union of free groups. This course, which is so much obstructed at present, is the true, forward march of society;

do not seek to hinder it, do not turn your back on progress, but march along with it! Then the sentiment of sociability which is common to human beings, as it is to all animals living in society, will be able to develop itself freely, because our fellows will no longer be our enemies, and we shall thus arrive at a state of things in which each individual will be able to give free rein to his inclinations, and even to his passions, without any other restraint than the love and respect of those who surround him.'

"This is our ideal, and it is the ideal which lies deep in the hearts of peoples—of all peoples. We know full well that this ideal will not be attained without violent shocks; the close of this century has a formidable revolution in store for us; whether it begins in France, Germany, Spain, or Russia, it will be a European one, and spreading with the same rapidity as that of our fathers, the heroes of 1848, it will set all Europe in a blaze. This coming revolution will not aim at a mere change of government, but will have a social character; the work of expropriation will commence, and exploiters will be driven out. Whether we like it or not, this will be done independently of the will of individuals, and when hands are laid on private property we shall arrive at communism, because we shall be forced to do so. Communism, however, cannot be either authoritarian or parliamentary, it must either be anarchist or non-existent; the mass of the people does not desire to trust itself again to any savior, but will seek to organize itself by itself."

History and Methods of Anarchist Communism

Anarchist-communism, tho more or less indebted to the thoughts of Rousseau, Proudhon, Ruge and others, owes its origin as a movement to the Russian Bakounin. Born of aristocratic and even princely parentage, Michael Bakounin, at first an officer in the Russian army, threw up his commission at the age of twenty-one, disgusted by the oppression of the government and the consequent sufferings of the poor, and studied philosophy, reading Hegel and Schopenhauer in St. Petersburg and Berlin. Coming into revolutionary circles mainly under the influence of Arnold Ruge, who represented the extreme Hegelian left, Bakounin took part in the Dresden insurrection of 1848, and was arrested and condemned to death, but eventually handed over to the Russians and imprisoned in Schlüsselberg and in 1852 sent to Siberia, whence, however, he eventually escaped through Japan and the United States, and in 1861 appeared in London, a revolutionist, declared by his enemies to be half crazed by his years of suffering and imprisonment. Be this as it may, he threw himself into revolutionary propaganda of every kind, mainly as an Internationalist, but sometimes as a Panslavist, and occasionally as a Nihilist. Switzerland, Italy, and southern France were the main scenes of his efforts, but he contrived to fill all Europe with his spirit of revolution. Gradually his utterances became wilder and his position more extreme. He commenced to preach the gospel of pan-destruction. When the International was founded in London under the presidency of Marx in 1864, Bakounin did not at first connect himself with it. But later, realizing what capital could be made of it, he threw himself into the movement, and almost captured the International for anarchism. He did capture it in Italy, Spain, southern France, Belgium, and to a large extent in Switzerland and other countries. In 1872, however, Marx as president contrived to have the congress of the International called at The Hague, where Bakounin could not come, since he was only secure in Switzerland, and would have been arrested in traversing any country through which he could have reached The Hague. At this congress, therefore, the adherents of Bakounin were defeated, and the General Council of the International was transferred to New York City. It resulted in the death of the International; but out of the split came the modern movements of democratic socialism and anarchist-communism, economic schools which, altho previous to 1872 more or less confounded, are now utterly distinct and even opposed. The ultimate ideals of the followers of Marx and Bakounin were not, however, so different. They both believed in communism, and communism was the early name for all socialism as well as for anarchist-communism; the split came in methods. The followers of Bakounin believed in destroying the State; Marx stood for capturing the State by legitimate political means, and through the State establishing the Social Democracy or communism. Both opposed the present State; but one sought to overturn it at once by force, the other sought to capture it and use it.

Origin

For a considerable time the anarchist-communists, especially in the southern countries, were stronger than the Socialists. The working classes did not see the strength of the Socialist program. Anarchist-communism appealed to revolutionary deed. Words, its advocates declared, were cheap. The propaganda by deed has ever been the favorite policy among anarchist-communists, being defended, tho not practised, even by such men as Krapotkin and Réclus. But organization among anarchists has never prospered. Their policy lends itself to individual deed. Bakounin did not quietly accept his defeat by Marx at The Hague. He and his adherents called another congress in Switzerland, and declared that they were the true International. From this time anarchist-communism had an organized existence. (For further details as to the preceding period, see Bakounin; International.)

In 1876 Bakounin died, Elisée Réclus, Paul Brousse, and others gathering around his grave, ready to carry on his work. In October of the same year a congress was held at Bern and enunciated the principles of anarchist-communism, altho still under the name of Socialism. It denounced even the Paris Commune, as not having entirely eliminated the principle of authority. At this congress were present two Italian delegates, Carlo Cafiero and Enrico Malatesta, who in April, 1877, went home to head a revolution in the Italian province of Benevento. They burnt archives, and laid their hands on what arms and money they could find, distributing them among the people. The same year a congress was held at Verviers, where Krapotkin first appeared on the scene under the name of Scrachoff. In 1878, Brousse and Krapotkin commenced publishing the *Avant-Garde*, the first anarchist organ. The same year, Nobeling and Hodel made their attack upon Kaiser Wilhelm at Niederwald; the cooper Broncasi attempted the life of Alphonso XII., and Passanante the life of King Humbert I. of Italy. At a congress at Freiburg that year, a letter from Réclus made the following succinct statement of anarchist-communism: "We are revolutionaries," he said, "because we desire justice. . . . Progress has never resulted from mere peaceful evolution; it has always been an outcome of a sudden revolution. The necessary preliminary preparation of the minds of men may be a gradual process, but the realization of their hopes comes abruptly. . . . We are anarchists, who recognize no one as our master, as we are ourselves the masters of nobody. There is no morality without liberty. . . . We are also international collectivists, for we are aware that the very existence of human beings necessarily implies a certain social grouping." The congress voted for the appropriation by the community of all wealth, the abolition of the State, and even of any central administrative agency; and as regards means of propaganda, the congress favored the dissemination of anarchist ideas, and even rebellion and revolutionary deed. In 1879 the *Avant-Garde* ceased to appear, and Krapotkin and others started a new paper, the *Révolté*, at Geneva (later moved to Paris). The same year Johann Most, expelled from Germany and driven from the Socialist meetings, arrived in London, Dec., 1878, and in Jan., 1879, began publishing his paper, *Freiheit*.

Organization

In 1880 Otero Gonzales attempted the life of Alphonso XII. At a congress held in Switzerland in this year, Krapotkin advised the adoption of the name "Anarchist-Communism" in the place of "Collectivism." In 1881 the French anarchists and Socialists finally separated, and a congress of anarchists was held at London. Krapotkin was banished from Switzerland for his utterances; Most, in London, was sentenced to sixteen months' hard labor for his words concerning the assassination of the czar. At the close of the sixteen months he removed, with his paper, to the United States. There were outbreaks in southeast France, and many discoveries of dynamite plots were reported. Anarchists were arrested all through southern France. In the north, Louise Michel delivered a series of lectures. The daughters of Elisée Réclus ostentatiously contracted "free marriages." Krapotkin himself was arrested. In 1883 the anarchist trials in France took place, and forty-seven were sentenced, among them Louise Michel. All through Europe at this time anarchists were being arrested and sentenced. In Spain a campaign was undertaken against the Black Band. In December Cyvoct was tried at Lyons for having caused the explosion at Bellecour Theater, and was sentenced to death, but the sentence was commuted by President Grévy. The year 1884 was comparatively calm, tho dynamite was found laid against the Federal Palace at Bern, and led to the expulsion of anarchists from Switzerland. In 1885 German anarchists were tried. Krapotkin published this year his "Paroles d'un Révolté" and Réclus his "The Products of the Earth." An attempt was also made to blow up the English House of Parliament. In 1886 there were several riots in Europe, especially at Charleroi, and the great strike at Chicago took place, with the famous Haymarket meeting, the arrest of eight anarchists, and the condemnation of seven of them to death (in 1887). (See Chicago Anarchists.) In 1887 *L'Idée Ouvrière* was started at Havre. In 1888 the *Père Peinard* began to appear in Paris, a paper written in the slang of the

streets. In 1890 the first international May-day demonstration took place, and the anarchists took advantage of it in incendiary speeches and gatherings. Merlino, Malato, and Louise Michel were imprisoned. *The International*, an anarchist paper, was started in London. In 1891 French anarchists agitated chiefly against the army and the police. At Levallois the black flag was unfurled. Several anarchist papers were started, among them the *Pot à colle* and the *En-dehors*. In 1892 bombs were exploded in France in private houses of deputies and at cafés, among others at the Café Rich. In June one of the dynamiters, Ravachol, was condemned to death, and executed in July. In 1893 there was more violence in Spain. Pallas was tried and executed for throwing a bomb at Marshal Campos at Barcelona, and there was also a terrible bomb explosion at the El Liceo Theatre in Barcelona. On Dec. 9th, Vaillant threw a bomb in the French Chamber of Deputies. In 1894 severe laws against anarchists were passed in France and other countries; 100 anarchists were arrested in France alone and several deported. The papers *Révolté* and *Père Peinard* were seized and compelled to discontinue. Jean Grave, the leading anarchist-communist after Krapotkin and Réclus, was imprisoned. Vaillant was executed. Émile Henry threw a bomb in the Café Terminus. Bombs were exploded also in the Hôtel St. Jacques and other houses. An attempt was made to murder the prefect of Barcelona. An Italian anarchist, Cesario Santo, assassinated the French President, Carnot, at Lyons. Restrictive legislation in Italy sought not only to arrest all anarchists, but to close all trade-union meetings. In Germany the kaiser introduced severe measures against both anarchism and socialism, which, however, were rejected by the Reichstag.

History

In 1893 an attempt was made to hold an anarchist-communist congress in connection with the World's Fair at Chicago, but it had to meet surreptitiously on account of the police, and when it met its members could agree upon no program nor declaration of principles, tho it is said that an international committee was chosen. In America anarchist communism has held on to the name of the old International longer than in Europe. In 1872, as we have seen, the general council of the International was transferred at Marx's suggestion to New York City. But in this country it never thrived. The fundamental differences between the Socialists and the anarchists soon showed themselves here, as in Europe. In 1877, the Socialist wing, in a meeting at Newark, took the name of the Socialist Labor Party (see SOCIALISM), and practically left the International to the anarchists. The split, however, was not at once complete. In 1883 the Socialists met at Baltimore and the anarchists at Pittsburg, and these took the old name of the International Working People's Association. By 1885 the split with the Socialists was complete, and since then in America, as in Europe, anarchists and Socialists have had nothing in common. The congress at Pittsburg adopted unanimously a manifesto or declaration of motives and principles, often called the Pittsburg proclamation, in which they describe their ultimate goal in these words:

America

"What we would achieve is, therefore, plainly and simply:

1. Destruction of the existing class rule, by all means—i. e., by energetic, relentless, revolutionary, and international action.

2. Establishment of a free society based upon cooperative organization of production.

3. Free exchange of equivalent products by and between the productive organizations without commerce and profit-mongery.

4. Organization of education on a secular, scientific, and equal basis for both sexes.

5. Equal rights for all without distinction to sex or race.

6. Regulation of all public affairs by free contracts between the autonomous (independent) communes and associations resting on a federalistic basis."

In 1881, however, another association was formed, designated by the initials I. W. A., or International Workmen's Association, differing in a few particulars only from the I. W. P. A. It lays greater stress on education and is somewhat less inclined to favor violence in the present, holding that a revolution in the minds of men must precede the political revolution. The following explanation of its principles and methods is taken from the "First Report of the Kansas Bureau of Labor Statistics":

"To print and publish and circulate labor literature; to hold mass-meetings; to systematize agitation; to establish labor libraries, labor halls, and lyceums for discussing social science; to maintain the labor press; to protect members and all producers from wrong; to aid all labor organizations; to aid the establishment of unity and the maintenance of fraternity between all labor organizations; to bring about an alliance between the manufacturing and the agricultural producers; to encourage the spirit of brotherhood and interdependence among all producers of every state and country; to ascertain, segregate, classify, and study the habits and acts of their enemies; to secure information of the wrongs perpetrated against them, and to record and circulate the same; to arouse a spirit of hostility against and ostracism of the capitalistic press; to prepare the means for directing the coming social revolution by enlightening public opinion on the wrongs perpetrated against the producers of the world; to obliterate national boundary lines and sectional prejudices, with a view to the international unification of the producers of all lands; and to eradicate the impression that redress can be obtained by the ballot. The organization is formed on the 'group' system—that is, any person who subscribes to these principles may become an organizer. He organizes a group of eight besides himself. When this group becomes thoroughly conversant with the principles and methods of the organization, each member becomes an organizer and forms a group of his own; and this goes on indefinitely. North America is divided into ten divisions—the Canadian, the British Columbia, the Eastern States, the Middle States, the Western States, the Rocky Mountains, the Pacific Coast, the Southern States, the Mexican, and the Missouri Valley. Each division is presided over by a division executive of nine persons. The International was organized on its present basis on July 15, 1881, with fifty-four delegates, representing 320 'divisions,' or groups, composed of 600,000 members. The countries represented were France, Belgium, Holland, Germany, Austria, Italy, Spain, Switzerland, Russia, Siberia, Bulgaria, Rumania, Turkey, Egypt, England, Mexico, and the United States."

It is the agitation of these groups of the I. W. A. and the I. W. P. A. which produced what popular anarchistic communism there is in this country. But the movement has come to naught. The I. W. A. and the I. W. P. A. no longer exist save in the minds of a few half-crazed persons, and the only recent activity has been the publication of a paper and the occasional delivery of speeches by Most and others, which make "good copy" for the newspapers. There have been also a few attempts of devoted but fanatical men to assassinate men of wealth and influence, like Frick and Russell Sage; but these acts have been very rare. When an agitator like Most speaks, he will often get a large audience, who will cheer his utterances, but the movement has no power.

Among English workingmen, too, there is little, if any, anarchism. The head of Oxford House, in East London, testified that there were no anarchists among the English working people, and that the last place possible for a man to arrive with a bomb was East London. Among the foreign residents in London there are some anarchist clubs, and there is some anarchist-communism among the intellectual radicals, but it has little force.

During the last decade a marked change has taken place in the anarchist-communist field. Heretofore the line between it and individualist (or philosophic) anarchism has been clearly drawn, and the former was almost identical with the revolutionary movement—that is to say, with the party or organization that both preached and practised the so-called "propaganda by deed." The assassination of the Spanish minister Canovas (1897) did not attract much attention; but when the unoffending, really liberal and unhappy Empress of Austria was assassinated in Switzerland (1898) a decided reaction against indiscriminate murder took place among those who, by simple acquiescence, had permitted themselves to become identified with the revolutionary movement. Large numbers of these withdrew altogether, denouncing the last killing as wanton and unjustifiable, while others, led by their individualistic and pacific tendencies, came more and more to consider the egoist-anarchist (or Tuckerian) movement the most congenial atmosphere. Of course, open adhesion to this latter was not in many cases given, because the antipathy existing in the ranks of the communists against anything individualistic was so great and so deep-seated that it could not be quickly or very generally overcome. The result, therefore, was that many ceased their open allegiance to the cause of the dynamiters, without affiliating themselves formally with any other movement, altho quietly expressed sympathy with individualism became quite common.

Recent Developments

It cannot be denied, too, that the tremendous advance of socialism in late years, apparently offering an immediate opportunity to overthrow the existing political *régime*, has attracted many of the more opportunist of the communists. These latter, however, were not displeased with the assassination, in 1900, of the King of Italy by Bresci, since Humbert was the responsible head of the repressive movement that was then being vigorously carried on by the Italian Government against all the open manifestations by labor-unions as well as those by the more radical reformers. Even the assassination of President McKinley at Buffalo by Leon Czolgosz in 1901, tho the act of one who was not actually affiliated with any definite movement, and who, so far as is known, acted wholly of his own volition, was not a particularly unwelcome deed to those communists who had been shocked by the killing of the Empress of Austria. Open and almost unqualified approval by the American press and public of the recent political assassinations in Russia has been pointed to by revolutionists as showing that it is not assassination of rulers *per se* that conservative people object to, but that they consider it reprehensible in other countries than those with an autocratic form of government merely because they feel that oppression by rulers has not yet reached a point where such tactics are justifiable. It becomes, therefore, merely a question of difference in opinion as to the quantitative valuation of the denial of liberty in countries having a more representative form of government. The individualist anarchists, as a rule, believe that assassination of rulers is

not justifiable where free speech and free press are not wholly denied; and this has come to be the real dividing line between them and the communists on the question of methods of propaganda.

Literature

Anarchist-communism in America now has no specific organ in English. *The Firebrand*, started on the Pacific coast some years ago, was moved to San Francisco and its name changed to *Free Society*; afterward it was moved successively to Chicago and to New York, and finally went out of existence in 1905. Since then *The Demonstrator*, published at Lakebay, Washington, by a group of colonists, is the principal organ in English which at the present time shows any sympathy for communism, tho, as a matter of fact, the colony is founded upon individualistic principles, and probably a majority of the colonists are individualists. It is, moreover, about the only really successful colony of radical reformers, which many attribute to the fact that the utmost freedom in every direction is accorded to the colonists by their by-laws. The communists have organs in French and Italian in New York, San Francisco, Paterson, N. J., and Charleroi, Pa., tho they are usually feebly supported and lead a precarious existence. *Mother Earth* is a small magazine recently founded in New York, and, altho having on its staff such revolutionists and communists as Emma Goldman and Max Baginsky, is not distinctively a communist organ, as some of its writers, present and prospective, are of individualist tendencies. The chief organ in German in America is *Freiheit*, edited for many years by John Most. In his death the militant revolutionists lost their most vigorous propagandist, altho his work was of such a nature that there was always a group who dissented violently from his methods as well as from his ideas. Voltairine de Cleyre is one of the most rational of the exponents of the doctrine that is now before the public, tho in recent years she has been prevented by ill health from being as active on the lecture platform as formerly. Her poems, are among the most effective of the literature of communism, but they are not collected in book form.

In France, Italy, and Spain the movement, tho not so vigorous as formerly, is still far from dormant, and has demonstrated its vitality by the continued publication of several newspapers, such as *L'Ere Nouvelle* and *Les Temps Nouveaux* (France), *Il Pensiero* (Italy), *El Progreso* (Spain), and a number of others. In England *The Freedom* is about the only paper to sustain the movement. The most prominent English anarchist communist is John Turner, who was detained under the immigration laws upon a recent visit to this country, and afterward ordered deported to England. He was imprisoned for more than three months at Ellis Island, pending an appeal of his case to the Supreme Court of the United States, but before the final decision was rendered he was released on bail, delivered a number of lectures in different parts of the country, and eventually returned voluntarily to England before the decision ordering his deportation was handed down. The recent release of Alexander Berkman, upon the expiration of his fifteen-year sentence in the penitentiary at Pittsburg, where he was incarcerated for an attempt upon the life of H. C. Frick, one of the steel magnates, has passed without any particular demonstration on the part of the communists, altho he is now doing some lecturing. Krapotkin, tho now quite old, is still the leading anarchist-communist of the world, tho the learned Elisée Réclus, recently deceased, was about his equal in popularity.

III.—Arguments against Anarchism

1. The argument against individualist anarchism is, first, that it starts from a false basis. The individual, say the philosophical opponents of anarchism, is not sovereign; he does not even exist. Man is not born to and never attains, nor can attain, individual sovereignty. From his birth to his death he is dependent upon his fellowman, and ever must be so long as he is a social being. Society is not made up of units, but is one; and the sooner this is realized, and man no longer attempts an impossible individual sovereignty, the sooner will the individual find his true freedom in developing his inmost personality in the unity of a perfect state. Anarchism is opposed thus, first, because it misreads the *facts* of individual life. Second, the opponents of anarchism assert that for anarchists to define the State as *necessarily* invasive, because states always have been more or less invasive, is to be illogical. The State, according to the anarchist's own admission, is a power, and has been, as at least most anarchists admit, in the past a necessary power. Why, then, throw away that power? Why—since some cooperative organization for defense and other purposes anarchists themselves declare necessary—not use the State, making it non-invasive? To say that the State cannot be harnessed to do the will of the people, because it never has been wholly so harnessed in the past, is as if a man before the discovery of the uses of electricity should declare that electricity always *must be* harmful, since it always had done harm. The fact is, say these critics, that the State, with all its evils—and they are to be admitted, every one—has in the past been immeasurably useful and beneficial, and should not be thrown away, but captured and improved and made to do the will of freemen.

2. As to the anarchist assertion that states have no right, for example, to compel any man to pay a tax, since no individual has a right to tax another, and the mere multiplying individuals into a majority cannot make that right in many persons which is wrong in one, it is said that this is purely a doctrinaire position of unproven ethics. That it seems axiomatic and convincing to a certain class of minds by no means proves its truth. The opposite assertion that the individual is born in society, and has as his only right to take his place in society, which is a natural unit, and not made up of individual units, and has rights and duties of its own, among others that of ordering the conditions of society according to the will of the majority, and compelling others to support it, is, it is claimed, as plausible a dogma as the anarchist dogma, and a good deal more deducible from facts. The truth is, that the science of social ethics is as yet so utterly undeveloped that to talk of what is ethically right in society is to say nothing. One man holds this opinion; another that; and neither can convince the other. The only possible way out of social problems, unless one take the religious ground of theism, and find in that a law of procedure, is to slowly learn by experience; believers in government, therefore, base their main arguments against anarchism on the facts of experience.

3. It will not work. Said President Andrews in a discussion with Mr. Tucker at Salem:

Impracticable, say its Opponents

Suppose the citizens of Salem to constitute an anarchistic group under the beautiful social compact which Mr. Tucker describes. Not many days will elapse before some of the parties to that compact will show how useless it is. Let some rioters from Beverly or Beverly Farms invade the Salem group. The foreman of the town calls all hands to turn out and put them down. One man replies that he does not care to come out; he has the rheumatism, or he is reading a book, or engaged in some other work, and says, "I pray you, have me excused." What is going to be done? I know of no way in which the anarchistic group named Salem can defend itself—as Mr. Tucker says is legitimate—except by coercing Meroz to come up to the help of the Lord against the mighty. The anarchist must here renounce his theory and resort to some of those species of action which Mr. Tucker denounces as not permissible because of the nature of coercion, aggression upon individual rights.

Says another writer: "Some rule there must be under any theory. You cannot escape law.

If it is not the rule of brotherhood, it must be the rule of might. You do not escape rule by flying to anarchy. Says Mr. Donisthorpe, in his 'Individualism: A System of Politics': 'It is a mistake to suppose that anarchism is lawless. Nothing of the kind. Where there is no ruling body; where there is no governmental authority, as in San Francisco within the memory of many of us, what happens? Did the marauders and pests of society carry all before them? Not a bit of it. Those who had inherited the habits of a social and methodical mode of life, owing to its greater average economy, banded themselves together and straightway lynched those who were desirous of violating the principles of order and method.' This, says Mr. Donisthorpe, was anarchism. Exactly; and most people prefer Uncle Sam, with all his faults, to Judge Lynch."

Concerning the economic impossibilities of anarchism, G. Bernard Shaw says:

> The full economic detail of individualist anarchism may be inferred with sufficient completeness from an article entitled "State Socialism and Anarchism; How Far They Agree, and wherein They Differ," which appeared in March, 1888, in *Liberty*.
>
> "The economic principles of modern socialism," says Mr. Tucker, "are a logical deduction from the principle laid down by Adam Smith in the early chapters of his 'Wealth of Nations'—viz., that labor is the true measure of price. From this principle these three men [Josiah Warren, Proudhon, and Marx] deduced 'that the natural wage of labor is its product.'"
>
> Now the Socialist who is unwary enough to accept this economic position will presently find himself logically committed to the Whig doctrine of *laissez-faire*. And here Mr. Tucker will cry, "Why not? *Laissez-faire* is exactly what we want. Destroy the money monopoly, the tariff monopoly, and the patent monopoly. Enforce then only those land titles which rest on personal occupancy or cultivation;* and the social problem of how to secure to each worker the product of his own labor will be solved simply by every one minding his own business."
>
> Let us see whether it will or not. Suppose we decree that henceforth no more rent shall be paid in England, and that each man shall privately own his house and hold his shop, factory, or place of business jointly with those who work with him in it. Let every one be free to issue money from his own mint without tax or stamp. Let all taxes on commodities be abolished, and patents and copyrights be things of the past. Try to imagine yourself under these promising conditions with life before you. You may start in business as a crossing-sweeper, shopkeeper, collier, farmer, miller, banker, or what not. Whatever your choice may be, the first thing you find is that the reward of your labor depends far more on the situation in which you exercise it than on yourself. If you sweep the crossing between St. James' and Albemarle streets you prosper greatly. But if you are forestalled not only there, but at every point more central than, say, the corner of Holford Square, Islington, you may sweep twice as hard as your rival in Piccadilly, and not take a fifth of his toll. At such a pass you may well curse Adam Smith and his principle that labor is the measure of price, and either advocate a democratically constituted state Socialist municipality, paying all its crossing-sweepers equally, or else cast your broom upon the Thames and turn shopkeeper. Yet here again the same difficulty crops up. Your takings depend not on yourself, but on the number of people who pass your window per hour. . . .
>
> It is useless to multiply instances. There is only one country in which any square foot of land is as favorably situated for conducting exchanges, or as richly endowed by nature for production as any other square foot; and the name of that country is Utopia. In Utopia alone, therefore, would occupying ownership be just. In England, America, and other places, rashly created without consulting the anarchists, Nature is all caprice and injustice in dealing with labor. Here you scratch her with a spade; and earth's increase and foison plenty are added to you. On the other side of the hedge twenty steam-diggers will not extort a turnip from her. Still less adapted to anarchism than the fields and mines is the crowded city. . . . "

Such, in brief, is Mr. Shaw's argument. Anarchism aims to establish individual liberty; but as long as any occupier can have the best lands in agriculture and the best building lots, he can, under free competition, receive enormous gains over his competitor—can with these gains buy machinery that others cannot afford, and run his competitors out of business, reenacting under anarchism all or most of the industrial evils that we have to-day—the development of great monopolies, the oppression of the small producer, wage slavery, the unemployed, etc. It is not government, but the natural inequalities of land and of human ability that are the fundamental source of the economic differences, and under competition the under dog must always serve the upper. The only way to individual freedom for all men is, then, to pool the difference of land and talent and have all work for all, which is collectivism. Such is, in brief, the "Socialist" argument against anarchism.

4. As to the anarchist communists, who are collectivists, it is said that for the poor, ignorant, and downtrodden to attempt to overthrow the state by force is but folly, no matter what the aim. To appeal to force will simply call out force, and the strong and rich and powerful will surely win. Moreover, to appeal to force without organization, as anarchist communists do, is to appeal to force in the weakest possible way. It may kill a few kings; it can never overthrow kingdoms. If it could overthrow the state it would simply produce a chaos, in which the strongest would rule and enact anything but equality on earth.

* See Mr. Tucker's article entitled "A Singular Misunderstanding" in *Liberty* of Sept. 10, 1892. "Regarding land," writes Mr. Tucker, "it has been steadily maintained in these columns that protection should be withdrawn from all land titles except those based on personal occupancy and use."

ANDREWS, ELISHA BENJAMIN: Chancellor of the University of Nebraska since 1900; born at Hinsdale, N. H., 1844. He served in the United States army, 1861–64, and was wounded at Petersburg (1864), losing an eye. Andrews studied at Brown University, Providence, R. I., and at Newton Theological Institution, Newton, Mass. (D.D., LL.D.). He was principal of the Connecticut Literary Institution, Suffield, Conn., 1870–72; pastor of the First Baptist Church, Beverly, Mass., 1874–75; president of Denison University, Granville, O., 1875–79; professor of homiletics in Newton Theological Institution, 1879–82; professor of history and political economy at Brown University, 1882–88; professor of political economy and finance in Cornell University, 1888–89; president of Brown University, 1889–98; superintendent of schools, Chicago, 1898–1900. Andrews was appointed one of the commissioners sent by the United States to the monetary conference at Brussels in 1892. In political economy he is of the historical school. On the question of the tariff, he believes in the infant-industry argument, and would carry it further than Mill. With regard to currency he is an ardent bimetalist; and on questions of industry he would neither nationalize nor municipalize any industry, monopoly or otherwise, till every available resource in the way of regulation had been tried in vain; he would then nationalize or municipalize, tho with care. Author: "Institutes of Our Constitutional History, English and American" (1887); "Institutes of General History" (1889); "Institutes of Economics" (1889); "An Honest Dollar" (1893); "Wealth and Moral Law" (1893); "History of the United States" (1894); "History of the United States in Our Own Time" (1904). *Address*, Lincoln, Neb.

ANDREWS, STEPHEN PEARL: Author; born in Templeton, Mass., 1812; studied at Amherst College; practised law in New Orleans. In 1839

he went to Texas where, becoming an abolitionist, he converted many of the slave owners, who were also landowners, by showing them that they would become rapidly rich from the sale of land if immigration were induced by throwing the country open to free labor. In 1843 he went to England in the hope of raising money to pay for the slaves and make Texas a free state. He was well received; but the plan was finally abandoned through fear that it would lead to war with the United States. Returning to America, he went to Boston and took part in the antislavery movement there.

While in England he learned of phonography, and after his return wrote and published extensively on that subject and on the philosophy of language in general. He was the founder of the present system of phonographic reporting, and is said to have been familiar with thirty languages. In later life he wrote more on sociology, especially on the family, taking an extremely individualistic position. He is claimed by the American philosophical anarchists as one of their great writers. (See ANARCHISM.) His most important works on that subject are: "Cost the Limit of Price" (New York, 1851); "The Constitution of Government in the Sovereignty of the Individual" (1851); "Love, Marriage, and Divorce and the Sovereignty of the Individual": a discussion by Henry James, Horace Greeley, and Stephen Pearl Andrews, edited by the latter (1853). Andrews died in New York City in 1886.

ANIKIN, STEPAN VASILIEVICH: Representative in the first Russian Duma from the province of Saratof; born 1869, of peasant parents. He attended a mechanical school at Saratof, and later was a zemstvo teacher in the county schools at Athar and Petrovsk. After numerous difficulties with the local authorities he was twice imprisoned. In the Duma he became a leader in the "Group of Toil." He died in Kief prison in 1907.

ANSEELE, EDOUARD: A leading Belgian Socialist and founder of the Socialist cooperative movement in Ghent. Born in Ghent, 1856; son of a shoemaker; studied at the royal atheneum of that city; became a notary and later a typesetter. Founded (1879) the "Vooruit," a Socialist cooperative club, with which was connected a cooperative bakery. This was the beginning of the great Socialist cooperative movement. (See BELGIUM.) Anseele is editor of the *Vooruit*, and treasurer of the International Socialist Committee. He was elected deputy from Liège in 1894 and 1898, and from Ghent, 1900; and was common councilor in Ghent in 1895. He is the author of various Socialist tracts, and of a Flemish socialistic novel for which he suffered six months' imprisonment.

ANTHONY, SUSAN BROWNELL: Lecturer, abolitionist, woman suffragist; born at South Adams, Mass., 1820. After completing her education, Miss Anthony taught in New York State from 1835–50. She first spoke in public in 1849, and from that time took part in the temperance movement, organizing societies and lecturing. Through her exertions and those of Mrs. E. C. STANTON, women came to be admitted to educational and other conventions, with the right to speak, vote, and serve on committees. This, however, was only gained after great opposition and public ridicule. About 1857 she became prominent among the agitators for the abolition of slavery. In 1858 she advocated the coeducation of the sexes. Since then her energies were chiefly directed to securing equal civil rights for women. In 1854–55 she held conferences in each county of New York in the cause of female suffrage. She was active in finally securing the passage of the act of the New York Legislature of 1860, giving to married women the possession of their earnings, the guardianship of their children, etc. During the war she devoted herself to the Women's Loyal League, and obtained 400,000 signatures to a petition in favor of the Thirteenth Amendment. In 1860 she started a petition in favor of leaving out the word "male" in the Fourteenth Amendment. In 1867 she went to Kansas with Elizabeth Cady Stanton and Lucy Stone, and there obtained 9,000 votes in favor of woman suffrage. In 1868, with the cooperation of Mrs. Stanton, Parker Pillsbury, and George F. Train, she began in New York City the publication of a weekly paper called *The Revolution*, devoted to the emancipation of women. In 1869, with Mrs. Stanton, she organized the National Woman's Suffrage Association. In 1872 she cast ballots at the state and congressional election in Rochester, in order to test the application of the Fourteenth and Fifteenth Amendments of the United States Constitution. She was indicted for illegal voting, and was fined by Justice Hunt; but in accordance with her defiant declaration, she never paid the penalty. Between 1870 and 1880 she lectured in all the Northern and several of the Southern States more than 100 times a year. In 1881 she wrote, with the assistance of her coeditors, Elizabeth Cady Stanton and Matilda Joslyn Gage, "The History of Woman Suffrage," in two volumes. In 1883, with Mrs. Stanton, she began in Europe the movement which led to the International Council of Women, held in Washington, 1888. In 1904, in her eighty-fourth year, she attended the International Council of Women in Berlin. She died in 1906, honored and loved.

ANTI-CIGARET LEAGUE, THE NATIONAL: Incorporated in 1901 as the outgrowth of the work of Miss Lucy Page Gaston, in 1897, as editor of *The Christian Citizen*, the organ of the National Christian Citizenship League, and as national superintendent of Christian citizenship in the W. C. T. U. The object of the National Anti-Cigaret League is to organize a national movement for the purpose of combating by all legitimate means the cigaret habit, and the use of tobacco in any form by boys. In furtherance of this object the National Anti-Cigaret League proposes to bring into cooperation all forces honestly working toward the same end in all countries; to hold public meetings; publish and circulate literature; to organize and maintain anti-cigaret leagues, and in every way possible to make sentiment against the manufacture, sale, and use of cigarets, giving special attention to needed legislation and to the enforcement of existing laws on this subject.

The league works by having anti-cigaret bills introduced in legislatures, by organizing anti-cigaret clubs in schools and elsewhere, by holding meetings, and by circulating pledges and literature, especially its monthly organ, *The Boy Magazine*, edited by Miss Gaston. A very large agitation on the subject has been created, and bills introduced in many state legislatures. President, David Paulman, M.D.; superintendent,

Miss Gaston; corresponding secretary, Mrs. Caroline F. Grow, 1119 Woman's Temple, 184 La Salle Street, Chicago, Ill.

In England also there has been considerable agitation of the subject. An International Anti-Cigaret League was formed in 1901, the founder and secretary being Rev. Frank Johnson, 57-59 Ludgate Hill, London.

ANTI-IMPERIALIST LEAGUE, THE: Formed 1898. Its constitution says: "This league was organized to aid in holding the United States true to the principles of the Declaration of Independence. It believes that governments derive their just powers from the consent of the governed, and holds self-government to be fundamental, and good government but incidental. It demands for all people under the United States government the rights guaranteed by the Constitution. Its object is by all proper means to oppose as inconsistent with American ideals the forcible extension of the sovereignty of the United States over foreign peoples and in particular to work constantly for the early and complete independence of the Philippine Islands." The league has enrolled a very large number of influential men as vice-presidents, and for several years after its organization was very active in holding meetings and issuing tracts and circulating literature. President, Moorfield Story; secretary, Erving Winslow, 20 Central Street, Boston, Mass.

ANTIMONOPOLY PARTY: Organized at Chicago, May 14, 1884. It nominated Benjamin F. Butler, of Massachusetts, for the presidency. Its platform demanded economical government, the passage and enforcement of equitable laws, including an interstate commerce law, labor bureaus, industrial arbitration, a direct vote for senators, a graduated income tax, payment of the national debt as it matures, and "fostering care" for agriculture. It denounced the tariff and the grant of land to corporations. Its nominee was also indorsed by the GREENBACK PARTY, and polled 130,000 votes.

ANTIPOVERTY SOCIETY, THE: Founded in New York City in connection with the Henry George movement of 1885–87. It was formed as a society, under the auspices of which "Father McGlynn" could conduct his work for land reform, which was then assuming large proportions.

> The object of the society was "to spread, by such peaceable and lawful means as may be found most desirable and efficient, a knowledge of the truth that God has made ample provision for the needs of all men during their residence upon earth, and that poverty is the result of the human laws that allow individuals to claim as private property that which the Creator has provided for the use of all."

The president was Dr. McGlynn. The first public meeting was held May 1, 1887, in Chickering Hall, and public meetings were continued for many months amid intense excitement. This was largely due to the personal interest taken in Dr. MCGLYNN and in his contest with his archbishop and the papal authorities. As that passed away the excitement of the movement gradually dwindled, and the meetings ceased. (See GEORGE, HENRY; LAND; MCGLYNN; SINGLE TAX.)

ANTIPURITAN LEAGUE, THE: Formed in London with the object of fighting against "Puritanism." It seeks to enrol those who resent Puritan domination, so that they may become as potent a force at elections as the Puritans are at the present time. The league stands for the recognition of the right of every citizen to decent and humane recreation. It advocates temperance in pleasures, instead of abstinence from them, and a rational use of the Sunday, instead of Sabbatarianism. It views with alarm the growing power of what may be called the Puritan party in English national and municipal politics. Those who regard half of human life as inherently vile, who look upon a dance or the drinking of a glass of beer as a mortal sin, are a small minority of the people of England. But they are admirably organized, and are consequently able to get their representatives elected to municipal bodies, and to frighten timid candidates into pledging themselves to their policy.

The league aims at organizing the forces which can be directed against coercive Puritanism, at bringing home to the mind of the ordinary citizen the dangers which its domination involves, and at educating the public mind to a saner view of public enjoyment. Its manifesto, from which this account is taken, is signed by such men as Hubert Bland, G. K. Chesterton, Stewart D. Headlam, Conrad Noel, and Cecil Chesterton, who is the honorary secretary. *Address:* 11 Warwick Gardens, Kensington, W., London, England.

ANTIRENTERS: An organization which from 1839 to 1849 resisted the collection of rent on certain manorial estates in New York State. Large portions of Columbia, Rensselaer, Greene, Delaware, and Albany counties, in the State of New York, belonged to manors, the original grants of which were made to "patroons" by the Dutch Company and renewed by James II. The tenants had deeds for their farms, but paid annual rental in kind, instead of a principal sum. After 1790 this arrangement caused growing dissatisfaction among the tenants, and in 1839 they refused to pay rent and began a reign of terror. In 1847 and 1849 the Antirenters "adopted" a part of each state ticket, and showed a voting strength of about 5,000. In 1850 the legislature directed the attorney-general to bring suit to try title. The suit was decided in 1850, but both parties were then ready to compromise—the owners by selling the farms at fair rates, and the tenants by paying for them.

ANTI-SALOON LEAGUE OF AMERICA, THE: The Ohio branch, formed in Oberlin in 1893, was the first state league organized. Rev. Howard H. Russell was the chief factor in its formation, and the first state superintendent. In 1895, at a meeting called in Washington, D. C., he was chosen national superintendent and organizer. There are now forty-three states and territories organized. About 350 people, including stenographers and mailing-clerks, are giving their entire time to the work of the league. The league publishes thirty-six state papers (thirty-two monthlies and four weeklies), with an aggregate circulation of nearly a quarter of a million.

The object of the league is the most radical repression and ultimate suppression of the liquor traffic. Its method is the federation of existing agencies—especially the churches. Its departments of activity are agitation, legislation, and law enforcement. It is interdenominational and

omnipartizan. Each state league is busily engaged in securing advanced legislation in harmony with the growing public sentiment, and in putting into operation such legislation wherever possible. Hundreds of towns and cities, townships and counties, are abolishing the saloons under the local option laws that have been secured through the efforts of the league in different states.

The national league, with offices at Washington, D. C., and Columbus, Ohio, is seeking advanced legislation in Congress, in harmony with the legislation that is being secured in the several states. General superintendent, Rev. P. A. Baker, Columbus, Ohio; assistant general superintendent, Rev. G. W. Young, D.D., Louisville, Ky.; superintendent of the legislative department, Rev. Edwin C. Dinwiddie, Washington, D. C.; attorney of the national league, Mr. Wayne B. Wheeler, Columbus, Ohio.

ANTISLAVERY: For the American Antislavery Society, see ABOLITION MOVEMENT; for foreign societies, see BRITISH AND FOREIGN ANTISLAVERY SOCIETIES.

ANTITUBERCULOSIS: See TUBERCULOSIS.

APPLEGARTH, ROBERT: Manufacturer, trade-unionist; born at Hull, England, 1833. Unapprenticed, he picked up the trade of a joiner and cabinet-maker, moved to Sheffield in 1852, and soon became the most prominent member of the local Carpenters' Union, inducing it to unite with the Amalgamated Society of Carpenters and Joiners in 1861. From 1862 to 1871 he held the office of general secretary of this organization, voluntarily resigning at last. He was an unsuccessful candidate for the London School Board from Lambeth in 1870; and was invited to be a candidate for Parliament at Maidstone, but retired in favor of Sir John Lubbock. In 1871 he was appointed a member of the Royal Commission on the Contagious Diseases Act. Resigning his secretaryship he entered journalism for a time, but before long became foreman to a firm manufacturing engineering and diving apparatus, eventually becoming proprietor of the business. He always retained his interest in trade-unionism. Mr. Applegarth sought to win for the trade-union organization a social and political status, and was, in his day, an ideal representative of the labor movement in the political world.

APPONYI, ALBERT G. A.: Austro-Hungarian count; born in Vienna, 1846; leader (since 1891) of the National Hungarian Party; hereditary member of the House of Magnates; from 1900 to 1903 President of the House of Representatives; reconstituted his party in 1904. He is an active worker for international arbitration and in the movement for the International Parliament. *Address*: Schloss Eberhard, Presburg, Hungary.

APPRENTICESHIP: A system whereby a person, usually a minor, is bound by law or trade regulations to work for another in consideration of maintenance or money wages, and for the purpose of receiving instruction in some trade or art. The question of apprentices and the apprenticeship system has always been of more or less importance in the United States. During the earlier part of the nineteenth century it was the cause of a large number of strikes among the workers who were suffering from the effects of an overcrowding of the trades by half-instructed apprentices and child laborers. It was partly for the purpose of correcting these abuses that the first national unions were organized in this country. Of late years, however, the question has again become prominent because of the agitation of the employers, who claim that the restrictions of the unions upon the number of apprentices allowed in each trade have caused a shortage of skilled labor, seriously interfered with the development of industry, and prevented the American boy from learning a trade.

The apprenticeship system is of comparatively recent origin, beginning as it did with the gild system of the Middle Ages. Adam Smith, in his "Wealth of Nations' (I. x. 2), states that "Apprenticeships were altogether unknown to the ancients. Roman law is perfectly silent in regard to them. I know no Greek or Latin word (I might venture, I believe, to assert that there is none) which expresses the idea we now annex to the word apprentice."

Gild System

The gild system, with its handicraft methods, its production solely for local markets, its steady employment, uniform wages, and lack of business depressions and panics, made an ideal setting for a very complete and thorough system of apprenticeship. The youth was bound out, or indentured, by his parents to a master with whom he lived and in whose shop the trade was learned, the master agreeing to furnish the apprentice with food, clothing, and shelter, and to teach him the trade; the latter agreeing to obey the orders of the master, keep all business affairs secret; and behave himself properly under all conditions. In England the usual period of apprenticeship was about seven years; in France, from three or four years to six, and in Germany, from two to four years, after which the apprentice became a journeyman with all the rights and privileges of the latter. In 1513 an indenture fee of 2s. 6d. was charged in England by the masters, and under James I. this was increased.

The Statute of Apprentices (1562) legalized the practises and customs of the gild system. It declared that no person could engage in any trade without having served an apprenticeship of seven years; that the master must hire one journeyman for every three apprentices, and for every apprentice above this number, still another journeyman; that the hours of labor should be twelve in summer and from daybreak until nightfall in the winter; and that wages should be fixed by magistrates who were also empowered to settle all disputes arising between master and apprentice. This law was of the greatest value to the journeymen. It made their condition secure, and practically guaranteed steady employment at wages "sufficient for the hired person in times of need as well as in times of abundance."

With the development of industry, following closely upon the invention of the steam-engine, these regulations seriously interfered with the *laissez-faire* ideas of the employers, who chafed at the restrictions placed upon industry, at the fixation of the hours and wages of labor, and at the limitations to the freedom of competition. Consequently it is natural to expect that they should fight (as they did) the enforcement of the Statute of Apprentices as bitterly as the gilds, and that the unions should stanchly support it. With the passage of years, however, the law was practically nullified by being flagrantly disregarded by the employers. Skilled laborers were dismissed and their places filled with hundreds of child-workers and apprentices. Instances are recorded in which "manufacturers employed as many as a hundred apprentices for every two skilled workmen," with the result that many of the skilled trades were ruined because of the ignorance of the workers. At the same time child and woman labor appeared in its most horrible aspects. Wages, no longer fixed by magistrates but by the employers, were reduced again and again, while the hours of labor were correspondingly increased. In an attempt at satisfying the demands of the employers the courts then interpreted the law as applying only to towns and cities, and to those industries in existence at the time of its passage. In 1809 the woolen industry was freed from the restrictions, and in 1814 the law was repealed in toto. From that time to the present, apprenticeship in England has remained untouched by governmental regulations.

In the United States, during the first half of the nineteenth century, the matter of apprenticeship was a troublesome one for the workers. As early as June, 1803, we find the Philadelphia Typographical Society passing resolutions to the effect that "No member of this society shall be permitted to work at presswork with any person who is not a regularly bred, bound apprentice till twenty-one years of age, except under penalty of expulsion." In 1807 the same organization considered it advisable to hold a conference with the master printers and ask that none but its members or "at least men who have served a reg-

In the United States

ular apprenticeship" be employed by them. In 1808 it fixed eighteen years as the age at which a person could be apprenticed, and in 1809 it set the period of apprenticeship for pressman or compositor at three years. No attempt, however, was made to limit the number of apprentices in this trade until 1835, in which year such a resolution was adopted by the New Orleans Typographical Society.

At that time the same struggle against the abuses of the apprenticeship system is to be noted in all lines of industry. T. V. Powderly, speaking of the latter portion of the first half of the nineteenth century, said that "The time of every session of the convention of every trade organization was taken up in discussing two measures, the question of wages and the regulation of the number of apprentices, other matters being of secondary importance." Employers considered it their unquestioned right and privilege to hire as many apprentices as they saw fit. With the use of labor-saving machinery the latter could produce as much as and at a lower price than could the skilled mechanics. It was in order to correct these abuses that several unions were formed at this time among the better class of workmen. The National Association of Hat Finishers (1854) was among the first of those formed for this purpose, and was followed in 1859 by the Iron Molders Union of America. Each of the journeymen molders had been compelled to accept two apprentices to be hired and taught by them, and it was only by means of their organization that they were able to put an end to this obnoxious system. The short-lived National Labor Union of 1860 declared for "a more rigid enforcement of the apprenticeship system as a preventive against filling the shops with botch mechanics." The Industrial Brotherhood followed it in 1874 by declaring in its preamble that it stood for the advancement of "the standard of American mechanics by the enactment and enforcement of equitable apprentice laws." Declarations of other unions at this time were to the same effect.

In the succeeding years the regulations and restrictions of the unions were so successful in removing the more flagrant abuses of the system, that for years this question has received comparatively little attention either from the public or from the workers themselves. Its decreasing importance is readily shown by the small number of strikes declared each year for the purpose of enforcing apprenticeship regulations, this number comprising but $1\frac{1}{10}$ per cent of all strikes during the period 1881–86, and further decreasing to $\frac{7}{100}$ of 1 per cent during the period 1881–1900. It is further evidenced by the fact that the census for the year 1900 returned but 81,482 apprentices and helpers in sixteen trades and other miscellaneous industries, or 2.45 per cent of all workers engaged in those occupations.

The immediate cause of the lately renewed agitation concerning the apprenticeship question is the claim of the employers that the unions have restricted the number of apprentices to such an extent that it is impossible to obtain enough skilled mechanics to meet the industrial demands.

Present Agitation

They are reiterating the arguments of the earlier unionists, that "the shops are being filled with botch mechanics" and that the "trade will be ruined unless a higher grade of labor is assured." The sources from which the larger factories formerly drew their supply of skilled workmen—i. e., (1) the small general shop, and (2) immigration—have practically disappeared. The large factory has absorbed the smaller, while the greater number of immigrants no longer come from the manufacturing countries of northern Europe. These conditions have resulted in demands for the establishment of manual training schools and trade-schools, and for the adoption of Industrial Education. The sincerity of the employers in their demand for a better grade of mechanics is seriously questioned by the unionists, who note that this demand is linked with agitation for the "open shop" and the destruction of organized labor. The workers also feel that such schools would greatly add to the number of workmen in the trades, thus increasing competition, lowering wages, and making employment less continuous. They also fear that if a person learn his trade in a school, rather than by working with union men "upon the job," he will acquire ideas and opinions different from those of the laborers, and will be taught the tenets of non-unionism by his instructors, thus rendering impossible the united action of the workers for their general betterment. It is impossible to predict the outcome of the agitation for industrial education and trade-schools, bitterly opposed as it is by the unions; yet, the permanent agreement between the Mason Builders' Association and the bricklayers' unions of Boston and vicinity, presents a very unique solution of the matter, as is shown by the following quotation taken from that agreement:

> The parties to this agreement (the employing masons and the bricklayers' unions) agree that they will join in an effort to establish an institution in this city where all the trades shall be systematically taught, and that when such a school is established they will unite in the oversight and care of the same.

Just as the evolution of industry and the development of society made impossible the enforcement of gild regulations concerning apprentices, so the same causes have practically abolished the necessity for, and the practicability of, the further application or retention of the old system of apprentices in most trades and occupations. A few trades remain, however, in which handicraft still retains an important place, such as in stone-cutting, carpentry, bricklaying, jewelry repairing, etc.; and it is in these scattered trades that an apprenticeship system can be retained to advantage. But under the large-scale production of to-day, specialization, the minute division of labor, and the extended use of machinery have made it unnecessary that a worker serve an apprenticeship and thus be skilled in all branches of his trade. In an ordinary factory but one or two all-around mechanics are required, the remainder of the workers being machine hands, mere automatons, who feed the material into the machine and make but a small portion of the finished product. In the majority of cases the worker cannot learn all the branches of the trade even tho he desired to do so, because of the fact that it is seldom that they are to be found under the roof of one establishment.

To learn all branches would thus necessitate a change of employers, and under such conditions a regular apprenticeship is impossible. Besides this, owing to our policy of standardization, the American factory turns out but a limited number of patterns or styles, and no necessity arises for the cultivation of individual skill or craft. Then, too, the employer seldom knows his trade well

Influence of Modern Methods

enough to teach it to his apprentices if he have any. He is engaged with the administrative side of the business, and knows but little of its mechanical processes. The workers, not being paid for teaching the apprentices, do not care to bother with them. The result is that the latter are usually left to pick up what they can of a trade by watching others, and sooner or later become what are known as "monkey-wrench mechanics." Many of the boys who enter a factory do not wish to spend three or four years in learning a trade. They desire to make money, and a job operating a machine will pay them higher wages and is more easily learned than a trade. This is also satisfactory to the employer, who desires that his workmen acquire speed and turn out a large product, rather than that they be taught all the branches of the trade as the unions require under an apprenticeship system. Even tho the employer attempt to teach the trade to his apprentices, he realizes that in a short time after the completion of their

instruction they would undoubtedly leave his employ and enter that of another, perhaps his competitor. Another consideration which makes the retention of the old apprenticeship system impossible is the fact that employment in the United States is at the best an uncertain matter. Panics, strikes, business failures, etc., force the laborer to travel from shop to shop and from city to city in search of work. Such unstable conditions of industry make the serving of an apprenticeship in almost any trade a practical impossibility.

Several of the large corporations, especially in the metal trades, have established carefully worked-out systems of apprenticeship in connection with their factories, the most notable of these, perhaps, being that of the Baldwin Locomotive Works. Some of these corporations apprentice a youth for four years, some for three. Some use a form of indenture or agreement, while others demand a money deposit on the part of the apprentice, as evidence of his intention to complete the course of instruction, the deposit being returned at the close of the term, with an additional sum given as a reward for good behavior and faithfulness. The wages of the apprentice vary considerably, both with the practises of the firm with whom he is working and with the extent to which he has completed his term.

Union Regulations

It is impossible to review here with any degree of thoroughness the various regulations placed by organized labor upon the hiring of apprentices. Only a general résumé of the situation, supplemented with a few specific examples, can be given. Apprentice regulations are fixt to a greater or less extent by the national union of the trade, but it seldom happens that these regulations are followed very closely by the local organizations. The latter may, and often do, make and enforce rules which differ greatly from those established by the national association, local conditions being the determining factor in each case.

The usual term of apprenticeship is three or four years, altho in some cases a shorter or longer period is demanded, as, for example, in the case of the watch-case engravers who require five years, and the New York electrical workers who only require two years. It is an almost generally established rule that apprentices must begin their trade before the age of sixteen or seventeen, the upper limit to the apprenticeship period usually being twenty-one years. It is customary for the unions to limit the number of apprentices that may be hired by an employer. In some trades this number is very low, as is the case with the stone-cutters, who forbid the employment of more than one apprentice to fifteen cutters, or more than two to any number less than a hundred cutters. In other trades, however, the number is very much greater, the pressmen, as also the trunk and bag workers, allowing one apprentice for every four journeymen. In some cases apprentices are affiliated with the union of the journeymen of their craft, and are classed as "auxiliaries"; in others, they support separate organizations, altho in a very large number of cases they belong to no organization whatsoever. In some trades the apprentices are forced to work longer hours than the journeymen, but as a rule they are taught all the branches of the trade.

According to the New York Electrical Workers' Union, an apprentice is "a boy registered by the union, who is employed to do errands, carry material to or on the job, attend lockers, and assist the journeymen in testing, but for no other purpose. Apprentices must not encroach on the work of helpers, or work with tools." They must be under nineteen years of age and must serve for two years. A shop can have one apprentice for the first ten journeymen or part thereof, and one more for every additional ten journeymen above the first ten. The United Association of Journeymen Plumbers allows one apprentice to a shop; the International Association of Machinists restricts the employer to one apprentice per shop and one for every five journeymen; the Iron Molders' Union permits one apprentice to eight workmen; the Typographical Union, one to seven; and the Cigar Makers' Union one to five.

The system of apprenticeship adopted by the Mason Builders' Association and the bricklayers' unions of Boston and vicinity is so unique that it deserves detailed mention in this place. By its terms no limit is placed upon the number of apprentices which may be hired by an employer, altho it is required that an apprentice shall be not less than sixteen years of age nor more than twenty-one, that he shall serve for three years, and that he shall be able to read and write the English language. A joint committee of the employers and the unions can be appealed to either by apprentice or employer in cases of disputes and failure to keep the agreement. The agreement fixes the pay of the apprentices at the rate of "eleven cents per hour during the first year, twelve cents per hour during the second year, thirteen cents per hour during the third year, and fifteen cents per hour for any additional years which they may be forced to serve under these rules; these sums to be paid weekly." In addition to this the apprentice receives an allowance of $50 the first year and $75 for every additional year, payable in quarterly instalments. An apprentice shall not be eligible to membership in the bricklayers' union of that locality unless he carries a card showing that he has completed the required term of instruction as laid down by the clauses of this agreement.

As typical of existing conditions, the recent investigation of the apprenticeship system in California by the labor commissioner of that state may be of interest ("Eleventh Biennial Report of the Bureau of Labor Statistics of California," 1904). In 1904 it was found that, of all the trades investigated, 13.41 per cent had no apprenticeship system, and that 30.9 per cent of the remainder imposed no restrictions upon the employers. "Generally the period of apprenticeship varied from two to five years, three and four years being the more common." Sixteen to eighteen years seemed to be the average age at which apprentices were taken.

All the states of the Union, excepting Idaho, Wyoming, and Nebraska, have elaborate apprenticeship laws upon their statute books, permitting and regulating the binding out of apprentices to employers and masters. These laws are practically obsolete, however, having been replaced by the regulations of the unions. The United States statutes permit the public printer to employ any number of apprentices less than twenty-five which he considers to be consistent with the economical operation of the office. So far as could be ascertained, no court in the United States has ever decided any case relating to the matter of regulating or restricting the terms of apprenticeship.

In Foreign Countries

In foreign countries, England excepted, the apprenticeship system is governed to a greater or less extent by statutory provisions. In some instances very "elaborate regulations exist, and the system holds absolute sway as far as the training of mechanics is concerned." The situation in England is similar to that in the United States, the terms of the apprenticeship being regulated by the respective unions. In this regard it is interesting to note that in 1897 Mr. and Mrs. Webb claimed that but 90,000 of the 1,490,000 trade-unionists of England belonged to unions which were strong enough to enforce apprenticeship regulations.

In France, during the period 1890–99, but $\frac{15}{100}$ of 1 per cent of all the strikes concerned the enforcement of apprenticeship rules. In that country, the terms of the apprenticeship contract are provided for by the laws of 1851 and 1892. No limit is placed upon the number of apprentices permitted each employer; but the latter is obliged to educate an apprentice if he be sixteen years of age and illiterate. For apprentices under fourteen years of age, and for those between fourteen and sixteen, the hours of labor are limited to ten and twelve per day respectively. Persons convicted of crime or of certain misdemeanors cannot hire apprentices unless they obtain a permit from the mayor of the town.

The labor unions of the cantons of Switzerland supervise the regulation of apprentices provided the unions contain a majority of the workers

in the trade. The apprentice is indentured by means of a written contract, and must not be made to work more than ten hours per day if he is between thirteen and fifteen years of age, nor more than eleven hours if he is over fifteen years of age. Night and Sunday work is generally forbidden. Every apprentice must be examined by a public board before he is admitted to the trade as a journeyman.

In Germany the law of 1897 provides for the regulation of apprentices. Only those persons enjoying all their civil rights can employ apprentices, and then only on the condition that the agreement with the apprentice be in writing four weeks prior to the commencement of the term. Three years is the average length of the term, altho chambers of commerce and trade are given the right by the government to "fix the duration of apprenticeship in each trade" as well as the maximum number of apprentices which may be employed in those trades, provided that the government has not already taken some action in regard to the matter.

In Austria "much attention is being given to perfecting the apprenticeship system." In non-manufacturing trades the terms of service are from two to four years, and in manufacturing trades not more than three years. No apprentices may be hired by any person previously convicted of a crime.

Belgium has no apprenticeship laws.

Arguments

The employers claim that in restricting the number of apprentices the unions are trying to obtain monopoly of the trades, are preventing hundreds of boys from learning a trade, and are seriously hindering the development of industry. The unions, however, argue that they have no desire to obtain any monopolies. They claim that if there were no regulations fixing the number of apprentices allowed an employer, the skilled mechanics would soon be replaced by ignorant and unskilled apprentices, and that the standards of the trade would deteriorate, wages decrease, and employment become less steady and continuous. In support of their arguments they point to the conditions which existed in the various trades before the unions were strong enough to enforce restrictions and regulations. They also claim that it is the employer who is to be blamed for the shortage of skilled labor, inasmuch as he often refuses to take as many apprentices as the unions permit, because he dislikes to be bothered with their instruction, and will not teach them all the branches of the trade. In short, he has brought about a shortage of skilled labor because he has been more anxious to have his workers acquire speed—which means a greater output, and consequently greater profits to him—than to have them acquire a thorough knowledge of the trade. The unions further state that it is only by means of the trade-unions that conditions can be maintained which make it worth a boy's efforts to learn a trade.

Under ordinary conditions of trade, with a period of apprenticeship fixed at three years, and one apprentice to every five workers, the present force of journeymen in all trades could be doubled once in every fifteen years. However, there is no necessity for fixing the limit at one apprentice for so small a number of journeymen, since there are few trades in which it would be requisite to have the number of skilled workers doubled every fifteen years.

AQUINAS, ST. THOMAS: The chief representative of the theology, philosophy, and economic teaching of the medieval Church; born in 1225 or 1227, at the castle of his father, the Count of Aquino, in the territories of Naples; received his education at Monte Cassino and the University of Naples. When but seventeen years old, in spite of the opposition of his family, he took the habit of the Dominican order at Naples, and was afterward sent away to study theology and philosophy under the famous Albertus Magnus at Cologne and Paris. Aquinas early gained distinction as a student of theology, and began his lectures, which were given at Paris, Rome, Bologna, and other places. He was on familiar terms with many princes of his time, and especially honored by the kings of France and of Naples, who frequently sought advice from him. Clement IV. offered him the archbishopric of Naples and the abbacy of Monte Cassino, both of which were declined. It was on the route to the Council of Lyons, whither he had been specially summoned by Gregory X., that Aquinas died, March 7, 1274. He was canonized in 1323 by Pope John XXII. In his life there was a union of simple piety with the greatest philosophical power. He fulfilled the ecclesiastical ideal of a saint and a father of the church. As a theologian his name stands with that of Augustine.

Aquinas represents scholasticism, the philosophy of the Middle Ages. Scotus Erigena, the earliest schoolman, said: "There are not two studies, one of philosophy and one of religion; true philosophy is true religion, and true religion is true philosophy." Hence the greatest work of Aquinas, the "Summa Theologiæ," aimed to give a summary of all the science of the time. This work is divided into three principal parts which may be said to treat respectively of God, man, and the God-Man. The latter part of the third division was added after the death of the author. With regard to the other works of Aquinas, it may be said that all his writings lead up to the "Summa."

Economics

To Aquinas theology is the sum of all science, and hence he is little interested in economics. But since the scope of the "Summa" was so wide, he was obliged to deal to a certain extent with both politics and economics. His statements have great value to students of social questions, because he so thoroughly represented medieval Church thought. In regard to private property, Aquinas justified individual ownership. He argued that the results of private ownership were beneficial, and he adopted Aristotle's theory that property should be owned separately, but used for the common good. In dealing with the subject of property as it concerned the monastic orders, or as it affected the highest sort of Christian living, Aquinas takes the conservative view. He holds, in opposition to many in the monastic orders who wished for absolute poverty, not only individual, but corporate, that property is only injurious when it hinders the spiritual life. A moderate property, especially if possest by a religious order, is not necessarily an evil.

In regard to the bestowal of charity, Aquinas does not unduly exalt almsgiving. The practise is obligatory; but at the same time alms need only be given, as a general thing, after a man has provided for himself and his family in a proper way. The giving should usually be from the superfluity—what remained after legitimate expenses.

Right of Taxation

One example of Aquinas's teaching on politics may be referred to. On the question of the right of government to tax its subjects, he favors the subjects rather than the prince. He says that rulers should seek the common good of the people in preference to their own advantage. Hence they should not take from their subjects by taxation save when some public need arises. Their revenues should be derived from their own special possessions.

In treating of commercial ethics, Aquinas follows generally the teaching of the earlier church fathers, and stands firm for the application of Christian principles to trade. He agrees with the old views as to usury, and especially with those of his instructor, Albertus Magnus. Usury is wrong. Money is consumable; the borrower has a natural right to make use of it when loaned, and the lender should not ask a payment for its use in addition to the return of the original sum, as this would be a double charge.

Trade was, in Aquinas's view, a base thing, and even sinful when carried on for the sake of gain. But it was not so when the trader pursued it as a means of livelihood, and was contented with a moderate profit, which he used for good purposes. Further, trade was also right when it served the public interest and provided a country with the necessities of life. The civil law was wholly imperfect, then as now, from a Christian standpoint, in its provisions regarding business. The Christian principle was, according to Aquinas, that no one should ever demand or pay more than a just price. He was conscious of the opposition between his teaching and the civil law, but he explains that human law has its necessary limitations, and does not prohibit everything that is wrong. Divine law is higher, and must forbid all things that are opposed to justice and virtue.

Divine Law

The scholastic philosophy reaches its culmination in Aquinas, and no medieval writer has had more influence than he. His "Summa Theologiæ" is even now, to a great extent, a recognized manual of the theology of the Roman Catholic Church.

REFERENCES: There is no adequate account of the economic teaching of Aquinas, which may be best collected from his own works. See the *Summa Theologiæ* as to private property, Secunda Secundæ, Quæstio 77, Articulus 3; Q. 66, Art. 1, 2; as to voluntary poverty, Q. 188, Art. 7; as to alms, Q. 32, Art. 5, 6; as to slavery, Pars Prima, Q. 96, Art. 3; Prima Secundæ, Q. 94, Art. 5; as to price, Secunda Secundæ, Q. 77; as to usury, Q. 78; as to taxation, *De Regimine Judæorum* among the Opuscula. The best brief account will be found in *La Philosophie de S. Thomas d'Aquin*, by C. Jourdain (1858). See also, *Economic History*, by W. J. Ashley (1888), vol. i., pt. 1, and the same author's article on *Aquinas* in Palgrave's *Dictionary of Political Economy*, to which article we are in the main indebted for that portion of our article bearing on Aquinas's economic teaching.

ARBITRATION AND CONCILIATION, INDUSTRIAL: The phrase "industrial arbitration and conciliation," in its broadest sense, refers to the entire subject of the methods of maintaining or, if broken, of restoring peaceful relations between employers and employees. (See also COMPULSORY ARBITRATION; NATIONAL CIVIC FEDERATION; NEW ZEALAND; TRADE AGREEMENTS.) But each of the terms "arbitration" and "conciliation" has a narrower technical meaning of its own. When the negotiations between employer and employees are conducted entirely between the two parties or their representatives and the procedure consists only of discussion and mutual concession between the two, the process is known as "conciliation." But when employer and employed refer the question at issue to final decision by some person or body other than the parties directly in dispute, it is called "arbitration."

If the reference to arbitration be made voluntarily by both parties, or if the acceptance by them of the decision or "award" when made be voluntary, the procedure is known as "voluntary arbitration." If, on the other hand, the government requires that, upon the motion of either party, or upon its own motion, the case shall be submitted to arbitration, and provides for the enforcement of the award when rendered, the process is "compulsory arbitration." To constitute compulsory arbitration in any true sense, it may be emphasized that the acceptance of the award must always be compulsory, whereas the reference to arbitration need be compulsory only for either party when the other desires it, tho it may be compulsory also for both without the desire of either.

Intervention by a third party may, however, take another form. The third party may intervene, either upon his own initiative or by invitation of one or other of the parties, simply for the general purpose of endeavoring to bring about a settlement of the dispute. Such action constitutes "mediation." When one or more employers negotiate with their employees collectively, concerning the terms of future employment, the procedure is known as "collective bargaining," a phrase of recent origin which is gaining wide usage. "Collective bargaining," it will be seen, is virtually conciliation in collective differences concerning terms of future employment.

The term is applied, not because the procedure is something essentially different from conciliation, but because conciliation in such form is of tremendous significance under modern industrial conditions.

The agencies of arbitration and conciliation may be either private or public. Considering first the former, we find them most highly and widely developed in Great Britain, the United States being second in importance in this field. Belgium and France, however, stand first in some respects in results accomplished. The development of these private agencies naturally lies within that period in which the modern industrial system, characterized by the employment of considerable numbers of work people in a single establishment or undertaking, has existed, and, at the same time, combined action by employees with reference to the conditions of employment has been recognized as legal. Roughly speaking (exact dates are impossible for the more general facts of this subject), the period of development of private agencies of industrial peace in Great Britain, where the oldest of these are found, appears to date from the third decade of the nineteenth century. In the U. S. the period of development of such agencies is approximately that since the Civil War, or the last forty years.

Private Agencies

The most primitive agency, so to speak, is an informal committee of unorganized employees, named for a particular occasion to negotiate with the employer. Such temporary conference committees are not uncommon in unorganized trades, but are usually resorted to only for negotiations within the limits of a single establishment, tho occasionally utilized in the case of several establishments.

Organization of labor opens the way for the development of conference bodies in two important respects. In the first place, with local unions affiliated with national organizations, the size of the field for which such bodies are available becomes extended beyond the single establishment or locality, until it becomes national in extent, covering an entire industry in a given country. In the second place, with the existence of permanent unions of work people, the temporary conference committee develops most easily into a *permanent* agency of peace, be it local or national. Very often the regular union officers, local or national, constitute a standing agency for negotiations, thus doing away with the necessity for naming special committees.

As the field of collective negotiations between employers and employees extends beyond a single establishment or firm, so as to involve a considerable number of employers, there arises the need of a representative body to act for the latter. The most elementary agency in such case, as in the case of employees, is a temporary committee named for a particular occa-

Collective Negotiations

sion. Such temporary conference committees of employers are not infrequently used in the case of negotiations covering a single locality where the employers have no organization. But more often they occur where the employers have some kind of organization, and such organization of employers, just as in the case of the employees, gradually paves the way for the development of permanent negotiation agencies.

So long as agencies of industrial peace in a given trade are employed only for the settlement of occasional disputes, they rarely develop beyond conciliatory conferences between temporary committees, resorting sometimes to arbitration by some equally temporary arbitration agency. The development of such temporary agencies into more permanent forms occurs usually in connection with collective bargaining. Collective bargaining being one of the fundamental methods of trade-unionism, it is usually found in practise wherever employers recognize its justice and advantages, or wherever the latter, because of the strength of organized labor, must perforce submit to it. Where it does occur, it commonly results in a written agreement as to terms of employment which is signed by the respective parties or their representatives. Such agreements are commonly known as "trade agreements" or "joint trade agreements," or "industrial agreements"; and the system of regulating the terms of employment by such agreements is often designated, especially in the U. S., as the "agreement system." A special form of agreement with respect to wages is the "sliding scale," in which the wages, instead of being fixt absolutely at a certain point for a given period, rise and fall at a rate agreed upon as the market-price of the product of the labor in question fluctuates.

Trade Agreements

Joint trade agreements are not infrequently adopted in the settlement of industrial disputes, and they are probably most often introduced into a given establishment or trade in that manner. When so adopted in the character of a treaty after a struggle between the parties, they are more frequently drawn for an indefinite time than when adopted as a result of amicable negotiations; in the latter case they are as a rule adopted for a definite period. Obviously in either case, but especially so in the latter, such written contracts (and they often read as formal contracts, sometimes with an exchange of nominal sums of money in more complete fulfilment of the contract idea) introduce a powerful influence for industrial peace in the simple element of permanency which they give to the conditions of employment. But a far more important assurance of industrial peace very often appears in connection with such agreements in that they contain clauses providing for the settlement by conciliation or arbitration of any differences that may arise in their interpretation. It is also frequently provided that, pending arbitration of such differences, there shall be no cessation of work. Manifestly, under such an agreement the certainty of industrial peace is limited only by the degree of loyalty with which the two parties adhere to the terms agreed upon. In only a very few instances do joint agreements prescribe fines for failure to carry out the arbitration decisions under them.

In the U. S. trade agreements do not, as a rule, make provision for their renewal; and the system becomes permanently established chiefly by custom. It is generally regulated by custom or by the constitutions or rules of the employees' organizations, and sometimes also by the rules of employers' organizations. In Great Britain, however, it is common for the system to be maintained under permanent written compacts or agreements, regulating the modes of procedure, etc. This undoubtedly adds to the stability of the system.

With the agreement system maintained chiefly by custom in the U. S., it is not surprizing that permanent machinery in connection with it, either for collective bargaining by which agreements are made, or for conciliation and arbitration in cases of dispute, is comparatively rare, tho it has been developed in some cases. The usual American practise is to name a conference committee for each periodic negotiation, or an agreement and conciliation committee for each dispute as it arises, or to choose an arbitrator for each special occasion. But in Great Britain it is usual to name permanent boards or joint-committees which are to decide in all matters under dispute. The British boards for collective bargaining are often known as "wages boards," and those for the settlement of differences as "boards of conciliation" or of "conciliation and arbitration," while the term "trade boards" is sometimes used for both classes together.

In regularly established collective bargaining it is rare, in the U. S., to find any resort to arbitration when conciliation fails to bring about an agreement. Such appeal to arbitration is less seldom in Great Britain, but in both countries the general sentiment appears to be strongly opposed to submitting the general terms of future employment to the decision of an outsider. Future terms of employment, however, are more frequently submitted to arbitration as a means of escape from a deadlock in conciliation. In the case of interpretation differences, resort to arbitration is much more frequent; and in all systems of collective bargaining which make any provision for such disputes, it is usually provided for as a second resort after conciliation.

In collective bargaining the actual process of negotiation is usually one of "higgling" between the two sides, each acting as a unit, until by mutual compromise a unanimous agreement is reached. Final decision of a question by majority vote of the conference is very rarely allowed; and usually, especially in the less permanent bodies in American practise, equal representation of employers and employees is not specially striven for. But in bodies constituted for conciliation of interpretation differences, it is common to find equal representation of employers and employees provided for, and decisions by majority vote are sometimes allowed. In cases of arbitration it is usual to have only one arbitrator, who is regarded as impartial and disinterested with respect to the particular trade or dispute; or else a board composed of an uneven number, in which, however, the final decision is practically that of a single member or umpire.

Mediation Agencies

Private *mediation* agencies—that is, agencies constituted by outsiders to intervene between employers and employees—are rare as compared with the agencies of peace constituted by the two industrial classes themselves. Occasionally it happens, in the case of a strike or lockout, usually one so serious as to affect the interests of the public, that an individual or a committee, either chosen or acting of its own volition, intervenes to bring about a settlement.

Usually, the mediators in such a case are prominent men of the community, and not infrequently public officials. The most notable instance of this sort in the U. S., because the interests involved were no less than national in extent, was the intervention of President Roosevelt in the coal strike of 1902.

Permanent private mediation agencies are even more rare than the temporary ones just noted. About the only thing of the kind in Great Britain are the "district boards of conciliation" which have been established in several industrial centers, usually under the auspices of the local board of trade, the most important being the London Conciliation Board. This board, which was an outgrowth of the great strike of London dock-laborers in 1889, comprises a number of conciliation committees, each composed of equal numbers of employers and employees, with one committee for each prominent group of trades in the city. In addition there is a central board composed of equal numbers of representatives named by employers and employees, to which cases may be taken on appeal from a committee, and which offers facilities for arbitration in case its efforts at conciliation are unsuccessful. The results accomplished by the district boards of conciliation in Great Britain have been insignificant except in the case of the London board which has accomplished some substantial results. Its work has not been extensive, however, and has been done chiefly through mediation upon its own initiative. A very notable permanent private mediation agency in the U. S., and the only significant one in this country, is that which has been established by the National Civic Federation in its Industrial Department. This agency has been active in a number of important disputes, and with a considerable degree of success. What it has accomplished has been almost entirely along lines of conciliation through mediation upon its own initiative.

Statistics

There are no comprehensive statistics of private agencies of industrial peace for any country except Great Britain, for which there are fairly complete statistics of the permanent private agencies; and as these are of especial interest because they present facts for the country most advanced in the use of such agencies, the following from the most recent reports may be quoted here. During the year 1904 the number of permanent boards of conciliation and arbitration known to have considered cases was sixty-two, one of which was a "district board," one a "general board," or one established by employers and employees but not confined to a single trade, while the other sixty were "trade boards," or those instituted by employers and employees for a given trade. The following table shows the amount and results of work done by these boards in 1904:

BOARDS	NO. OF BOARDS WHICH		NO. OF CASES	
	Considered cases	Settled cases	Considered	Settled
Trade boards	60	52	1,413	610
General boards	1	1	1	1
District boards	1	1	4	4
Total	62	54	1,418	615

Of the 803 cases not settled, 748 were "withdrawn, referred back, or settled independently of the boards," and fifty-five were pending at the close of the year. Of the 615 cases settled, 400 were settled by boards or committees, that is, by conciliation, and 215 were decided by arbitration or umpires named by such boards or committees. Among the cases settled were ten strikes or lockouts, of which seven were settled by conciliation, and three by arbitration. The number of boards known to have settled cases varied but little from 1900 to 1904, having numbered in those five years respectively 64, 54, 57, 62, and 54.

Government Agencies

Since, as noted in the foregoing, recognition of collective disputes as legal is of comparatively recent date, and individual disputes were characteristic of the industrial régime prior thereto, it is not surprizing to find that the oldest government agencies for industrial peace were established for individual disputes. In Great Britain, prior to 1803, a series of statutes, going back as far as the Statute of Apprentices in 1562, contained provisions with reference to disputes between masters and servants. All of these provided simply that disputes should be summarily settled by justices of the peace, the authorities charged with the fixing of wage-rates for all labor under the then existing system of government regulation of industry.

In 1803, 1804, and 1813 special acts for disputes in the cotton industry were passed, differing from the earlier laws in that they provided that disputes should be settled by arbitration by two referees appointed, one by the employer, the other by the employee, from nominations made by a justice of the peace to whom the dispute was to be referred for final decision in case the two arbitrators could not agree. Finally these three laws were consolidated and extended to all industries by the Consolidation Act of 1824. This act did not alter any of the provisions for arbitration, except to forbid justices of the peace to fix future wages without the consent of both master and workman, this limitation being practically a recognition of the principle of freedom of contract between employer and employed which had been formally established by the repeal of the Statute of Apprentices in 1814.

All the earlier statutes had provided compulsory arbitration for all disputes; the Consolidation Act provided still for compulsory arbitration for interpretation differences, but recognized the fundamentally different character of disputes touching future terms of employment by providing only voluntary arbitration for such, at least for all those touching wages. The Consolidation Act was passed because the earlier laws had been effectual; yet it proved a total failure, tho it was in force until 1896. It appears to have been an anachronism. It was passed coincidently with the formal recognition of the right of working men to combine by the repeal of the combination laws by Act of 5 Geo. IV., ch. 95, the Consolidation Act being 5 Geo. IV., ch. 96. With the repeal of the combination laws the pressing problem of industrial peace became at once that of collective disputes, whereas the Consolidation Act offered only provisions drawn essentially for the individual disputes of an earlier régime.

For the most notable agency for the settlement of individual disputes, and one which is still in existence, one must turn to continental Europe, to the French system of *Conseils des Prud'hommes*

or Councils of Experts. These were first instituted in France in 1806. The law of that year, since frequently amended, which established the system in France, applied also to Belgium, which was then a French dependency; and the first Belgian Council was established in 1809. Laws regulating the system were afterward passed by the Belgian Government. Prior to the acquisition of the Rhine Province by Germany, councils under the French law were established there, and from thence the institution spread to other parts of Germany, being regulated by state or municipal statutes until 1890 when an imperial law governing the system was passed. In 1882 the Swiss canton of Geneva established a council, followed by the cantons of Neuchâtel (1885), Vavd (1888), Basel-Stadt (1889), Lucerne (1892), and Bern (1894). In 1893 Italy established the system. In all five of the countries named—France, Belgium, Germany, Switzerland, and Italy—the systems of Conseils des Prud'hommes, or Gewerbegerichte, as they are called in Germany, are still maintained, and are in active operation. In 1903 there were in France 153 councils which heard disputes; in Belgium, 33; and in Germany, 400. In 1905 Switzerland had at least 7 councils, and in 1899 Italy had 39.

Conseils des Prud'hommes

With regard to details of organization and procedure the councils in different countries vary considerably, but the general plan of all is essentially the same. They are established by the government, either national or local, but their members are elected by the employers and employees within their jurisdiction, except the president and vice-president who in France and Switzerland are chosen by the members from among their own number, but in Belgium, Germany, and Italy are appointed independently by the government. Two bodies are organized in each council: the one a conciliation bureau or committee; the other the general, or arbitration bureau. Cases go first before the conciliation bureau where an effort is made to bring about a settlement by conciliation. If such effort fails, the case goes to the general bureau for final decision. In both bureaus there are always equal numbers of employers' and employees' representatives. The procedure is compulsory upon the desire of either party, and awards or decisions are enforceable as in ordinary civil courts. The jurisdiction of the councils is limited essentially to individual disputes growing out of the interpretation of existing contracts.

Procedure

The systems of Conseils des Prud'hommes have been very successful and are doing a large amount of work. Thus, in 1903, the number of cases brought before the councils in France was 43,832; in Belgium, 8,277; and in Germany, 97,561. Of the cases before the French councils 18,591 were settled by conciliation, 4,588 by arbitration, and 16,240 were withdrawn by the parties.

Impressed by the obvious evils of the industrial warfare of strikes and lockouts which affect the general public as well as the contestants, many governments have in more recent years endeavored to provide by law for the settlement of collective industrial disputes. In 1905 no less than fifty-one different national or state governments had some provision of law relating to the subject, and a number of these had passed more than one act upon the subject. With but three unimportant exceptions, all this legislation is the product of the last thirty years. With this mass of laws all that can be attempted within the limits of the present article is a very general classification according to their more important characteristics and results, considering first foreign statutes and afterward American laws.*

Government Agencies for Collective Disputes

Standing quite by themselves as the only general compulsory arbitration laws in the world are four statutes of the British colonies in Australasia. These, with the dates of the earliest laws in each case, are: New Zealand (1894), Western Australia (1900), New South Wales (1901), and the Commonwealth of Australia (1904). These compulsory arbitration laws, in their present form, have practically unlimited jurisdiction over collective industrial disputes of all kinds, except that the Commonwealth law takes cognizance only of disputes extending beyond the limits of any one of the Australian states. They provide, except in New South Wales, for both conciliation and compulsory arbitration. New South Wales provides only for compulsory arbitration. The conciliation agency provided is, in New Zealand and Western Australia, a board whose members are elected in equal numbers by employers and employees, with a chairman chosen by the members; in the Commonwealth the same agency as for arbitration. For arbitration the three state laws provide a court consisting of three members appointed by the government: one from nominations made by employers, and one from nominations made by employees, while the president is chosen directly by the government from the highest civil court of the colony. In the Commonwealth the arbitration court consists of only a single judge appointed by the government. All of these compulsory arbitration laws proceed upon the principle of utilizing to the utmost the advantages for collective negotiations to be derived from organization of employers and employees, especially the latter.

New Zealand Australia

In connection with these compulsory arbitration systems, strikes and lockouts are very largely prohibited, especially in the New South Wales and Commonwealth laws. In practise the three state laws have proved generally successful to the extent of having practically eliminated strikes and lockouts from industrial life, the Commonwealth act being too recent to show results in practise. The most notable development in practise has been the fact that, for the most part, the conciliation provisions have been of little use and most of the work has had to be done sooner or later by the arbitration courts. For this reason the New Zealand law, which originally required conciliation procedure, had later to make it optional; while New South Wales made no provision whatever for conciliation in her law. The whole tendency of practical experience has thus been to enlarge the scope of the compulsory arbitration features, and to employ them exclusively, with a consequently increasing amount of the virtual government regulation of industrial relations which compulsory arbitration involves.

Three of the countries which have the systems

* The laws are described as they are at present, without special reference to amendments; and the year given in parentheses refers to the time when the earliest law of the kind in question was passed.

of Conseils des Prud'hommes, or industrial courts for individual disputes, have utilized those courts for intervention in collective disputes also, viz., Germany (1890); Italy (1893); and Switzerland (Cantons of Geneva, 1882; Vavd, 1888; Lucerne, 1892; and Bern, 1894). In Switzerland there is provision only for conciliation by the courts in collective disputes; while in Germany and Italy arbitration is also provided, but the distinction between individual and collective disputes is carefully preserved, and for the latter the arbitration is entirely voluntary in character. Very little has been accomplished under these provisions for collective disputes, except in Germany. The German courts have developed extensive activity in their field, and are accomplishing important results, for the most part entirely by conciliation. Thus, in 1903, the German courts intervened 174 times in collective disputes, and settled sixty-one —fifty-four by conciliation, and seven by arbitration.

Germany Italy Switzerland

Another group of foreign laws may be distinguished in those which undertake to establish permanent special agencies for the settlement of collective disputes.

The oldest of these is a British law of 1867, known as Lord St. Leonard's Act, which attempted to foster the establishment of boards for conciliation and arbitration after the pattern of the French Conseils des Prud'hommes by granting to such boards, when established voluntarily by employers and employees, and fulfilling the requirements specified in the law as to organization and procedure, a license under which they might exercise the powers specified in the Consolidation Act of 1824, to compel the presence and testimony of witnesses and enforce arbitration awards except when the latter concerned future wages. This law was, however, a total failure, as were likewise two British colonial statutes which copied it; namely, a law of 1873 in Ontario (Canada), and one of 1891 in Victoria, the latter with all compulsory arbitration features eliminated, and both with no restriction as to disputes touching future wages.

Permanent Government Agencies

In Belgium (1887) and the Netherlands (1897) are two laws, the later one modeled after the earlier, which provide for the establishment of councils of labor and industry, composed of members elected in equal numbers by employers and employees. These councils, which are under very direct government supervision, have a threefold function: (1) To give information or advice to the government concerning the condition of labor; (2) to serve as conference committees for collective bargaining, and (3) to settle industrial disputes. For the two latter purposes conciliation only is provided for. The system of councils of labor is in active operation in both countries, Belgium having seventy-six councils in 1903, Netherlands ninety in 1904. In practise the function of the councils as statistical and advisory agents of the government has been most important, especially in Belgium. In the Netherlands they have accomplished most in the way of collective bargaining and settlement of disputes. Thus, in 1903 they assisted seventy-three times in amicable negotiations concerning terms of employment, twenty-eight cases of which concerned government work; and in 1904 they intervened in thirteen strikes and lockouts, and brought five to a settlement.

Holland and Belgium

In 1892 New South Wales passed an act providing for permanent councils of conciliation, and a council of arbitration for the settlement of collective disputes. There were to be either several conciliation councils in industrial districts into which the colony should be divided, or one large colonial council from which a special council for each dispute could be chosen, the members of these conciliation councils to be elected in equal numbers by employers and employees, with a secretary appointed by the government. The one court of arbitration was to consist of three members, one each to be named by employers and employees, with the third (the president) to be chosen by the other two, or, failing that, appointed by the government. In each dispute there were to be efforts at conciliation first, with appeal to arbitration or, if the parties desired, reference to the arbitration court in the first instance, arbitration in any case being voluntary in character.

Three of the British Canadian colonies have copied this New South Wales statute—British Columbia (1893), Ontario (1894) and Quebec (1901)—without important modifications, except that Ontario by subsequent amendment (copied in Quebec also) enabled the government to itself appoint the members of the council of arbitration, and permitted that council to mediate in disputes of its own motion, thus providing an essentially independent government agency in place of one established by employers and employees. The system of conciliation and arbitration councils contemplated in the New South Wales law has been practically a failure in the four British colonies which adopted it. The machinery for it was set up in all save British Columbia, where it was never established, but so little was accomplished by the councils that New South Wales finally abandoned the whole system, and Ontario and Quebec amended the plan by providing for independent mediation in disputes by the clerk of awards; or registrar as he is styled in the two Canadian laws. Something more has been accomplished by the registrars alone (the registrar intervened in twelve disputes in 1902 in Ontario), but no important results have thus far been attained.

Canada

A very elaborate act of 1894 in South Australia provided for a system of boards of conciliation and arbitration on the same general plan as the New South Wales system just described, but providing, instead of purely voluntary arbitration, what may be designated as permissive compulsory arbitration; that is, a system of compulsory arbitration, very much the same as that of New Zealand, but applicable to employers and employees only so far as they chose to voluntarily put themselves under its jurisdiction. The act, however, failed utterly, simply because none chose to submit to it.

In connection with laws making provision for permanent special agencies for collective disputes, passing mention may be made of the Austrian law of 1896. This law, which established gilds for the mining industry, incidentally provides for conciliation in collective disputes (there is also provision for individual disputes), through the agency of the executive committees of the gilds, tho scarcely anything has been accomplished by this provision. The Danish Act of 1900, which gives private boards of arbitration for interpretation differences power to summon and examine witnesses, may also be mentioned.

A more numerous group of laws is comprised by those which, without creating any special agency therefor, provide for conciliation or arbitration of collective disputes through some government officer or administrative body. The earliest of these acts, and perhaps the most important, is the French law of 1892. This law provides for mediation by local justices of the peace, either for conciliation by committees named by the parties to the dispute in question, with the justice as chairman, or if conciliation fails, by three arbitrators, one being named by each of the parties, with an umpire either chosen by the two, or, in a deadlock, named by the local civil judge; the entire procedure is voluntary for the parties. Mediation by a justice may occur upon application of the parties or, in case of strikes and lockouts, on the justice's own motion. Large results are being accomplished under this French law. Thus, in 1903 intervention under it was attempted 152 times (143 times in strikes and lockouts), fifty-eight upon the initiative of the justices, and fifty-three disputes were settled, fifty-one by conciliation and two by arbitration.

Government Officials

Next in importance to the French law is the British act of 1896, which provides for mediation by the British Board of Trade. In case of disputes, the board is empowered, of its own volition, to inquire into the circumstances and endeavor to bring about conciliation. Upon application from either party, it may name one or more private persons as conciliators; or, on application of both parties, appoint an arbitrator for voluntary arbitration. The board may also encourage the formation of private boards of conciliation. Three British colonies have copied this act of the mother country (New South Wales, 1899; the Dominion of Canada, 1900; and Nova Scotia, 1903) with no important change, save that New South Wales and the Dominion both add provisions for formal public investigation of disputes in New South Wales, at the option of the government; in the Dominion at such option and with the consent of both parties. The duty of intervention under the law is delegated in New South Wales to the minister of public instruction, labor, and industry; in the Dominion to the minister of labor; and in Nova Scotia to the provincial secretary.

Great Britain

As to the results achieved under these laws, nothing had been accomplished in Nova Scotia down to the middle of 1905. Results in New South Wales have been very meager, and altho the act is still in force there it has practically been superseded by the compulsory arbitration law of 1901. Under the British and Canadian acts, however, substantial results have been accomplished. Thus, during the two years ended June 30, 1903, there were forty-one interventions, actual or requested, by the British Board of Trade under the law of 1896. In all of these application from one or both parties was received, and the same has been true with but very few exceptions in previous years. Of the

forty-one cases, in four the board declined to act; four were settled by the parties during negotiations, two by conciliators named by the board, and twenty-seven by arbitrators chosen by the board; three failed of settlement, and one was pending at the close of the year.

The most striking feature of the British act has been its usefulness in offering a means of escape from deadlocks in private negotiations, and the results accomplished in this direction have led to the adoption by many private boards of rules providing for an appeal to the Board of Trade when the private board is unable to agree. Of experiences under the Canadian act it may be noted that the power of public investigation specially provided in that act has been used with good effect in some stubborn disputes, through the publicity thus secured. A law somewhat resembling the British act of 1896 is that of 1894 in British Columbia, which makes it the duty of the provincial secretary to assist the parties to a given dispute in forming a conciliation council and, if need be, an arbitration council, for that particular controversy; but there is no provision for mediation by the secretary himself. The act offers these councils large official sanction by providing that the members, tho chosen by the parties, shall receive appointment from the provincial governor, and by giving them power to summon witnesses. The expenses of such councils are paid by the government. In practise, however, the act has been fruitless, no councils ever having been formed under it.

Switzerland

In Switzerland there are two practically identical laws (Basel-Stadt, 1897, and St. Gallen, 1902) which provide for intervention in industrial disputes by the council of state, either upon request from the parties or, in grave cases, upon its own motion, by appointing a board of conciliation comprising equal numbers of employers and employees for purposes of conciliation only. There has been some little activity by the councils of state under these acts, that in Basel-Stadt having intervened in six disputes in 1904, and settled three.

In Austria, under a general clause of the factory law (1883), the state factory inspectors have developed large activity as mediators in industrial disputes. The greater part of such work is done in connection with individual disputes; but much is done also in collective differences, as shown by the fact that in 1903 they intervened in 110 strikes and lockouts.

The remaining three laws in the group of those providing for intervention of government officers are statutes relating only to special industries or special subjects of dispute. The earliest of these is a statute in Nova Scotia (1888), providing for arbitration of disputes in coal mines owned by, or leased from, the government. These are under the administration of a commissioner of works and mines who, in case of a dispute concerning wages, may refer the dispute to arbitration by a board comprizing two members permanently appointed by the provincial governor, one member each named by employers and employees, and a fifth chosen by the last two. A unique feature of this arbitration plan is a provision for the posting by each side of a money forfeit, a certain amount of the wages due the workmen and an equal sum by the employer, to be paid over to the one party in case the other does not at once submit to the award. Awards may also be enforced by ordinary process in the civil courts, so that the system amounts to compulsory arbitration. This statute has been almost a dead letter, however, having been invoked but twice down to 1905.

American Laws

In 1904 a decree of Argentina, notable as the first South-American law dealing with the settlement of industrial disputes, made it the duty of the chief of police of Buenos Ayres to intervene as mediator in collective disputes over questions of Sunday rest or hours of work. But by far the most important of the laws for special industries or subjects is the Canadian Railway Labor Disputes Act of 1903. This provides for intervention by the minister of labor in collective disputes involving suspension of work or interference with traffic on railways. The minister is to intervene primarily for the purpose of bringing about conciliation. That failing, the case is submitted to arbitration by a conciliation committee or board of arbitrators composed of three members, one named by each of the parties, and the third chosen by the other two or by the parties. The arbitration is purely voluntary, but publicity of awards is required.

Of the remaining two foreign laws, providing for permanent industrial agreements between employers and employees, one was the British Arbitration Act of 1872, which contemplated the drawing up of permanent agreements between employers and employees. These agreements, in addition to specifying the terms of employment, should designate some agency to arbitrate disputes, such agencies to have the power of compelling the production of evidence. This act, however, altho it remained in force until 1896, was from the first a dead letter, no agreement under it ever being made. A more modern law for agreements is one in the Swiss Canton of Geneva (1900), which provides both for regular periodic collective bargaining and trade agreements, and for the settlement of disputes. Three successive methods and agencies are specified for either purpose: (1) A conciliation conference of employers' and employees' delegates; (2) mediation between the delegates by a representative of the council of state of the canton; (3) arbitration by a board composed of the delegates and the central committee of the Geneva Conseil des Prud'hommes. In case of disputes the council of state may itself inaugurate proceedings as above. There is no means provided to enforce arbitration awards, but strikes and lockouts pending proceedings, or under agreements made under the law, are forbidden.

United States Laws

In the U. S. no provision has ever been made for individual disputes; but the federal government and twenty-four of the states have made some provision by law for collective disputes. Two federal laws have been passed (1888 and 1898), both limited in application to interstate commerce. The former specified two procedures: (1) Voluntary arbitration of disputes by a board of three members, the only action of the government being the endowment of such a board with power to secure evidence, and the publication by the Commissioner of Labor of the award; (2) public investigation into the causes of a dispute and the best mode of terminating it, to be instituted upon the government's initiative by a commission comprizing two members named by the President of the U. S. together with the Commissioner of Labor as chairman, the findings of the commission to be made public. No arbitration under the law of 1888 ever occurred, but one public investigation was made under it in the great Pullman strike of 1894, the investigation being made after the dispute was practically ended, and the elaborate report being devoted to a history of the case and discussion of the general question of methods of settling such disputes.

Many of the recommendations of the commission of 1894 went into the law of 1898, which repealed the earlier act. This later law, which is still in force, provides for two procedures also: (1) Mediation by the Interstate Commerce Commission and the Commissioner of Labor upon request of either party; and (2) arbitration essentially as in the law of 1888, except that awards are made enforceable by process of law, tho submission to arbitration is entirely voluntary. There has been no practical application of this law.

Local Arbitration

The thirty different state laws (in twenty-four of the states), which had been passed down to 1905, present so many similarities that they may be grouped in four classes. The first group comprizes those laws which provide for local arbitration, with no permanent agency therefor, and includes four special acts: Maryland, 1878; New Jersey, 1880; Pennsylvania, 1893; and Texas, 1895. Ten laws have incidental provisions for state boards; namely, those of California, Colorado, Idaho, Massachusetts, Minnesota, Montana, New Jersey, New York, Ohio, and Wisconsin. The general features common to nearly all these laws are: (1) That they provide only for voluntary arbitration; (2) that the agency in each case is a temporary board; and (3) that such boards are given power to compel the presence of witnesses and the production of evidence. As to practical results these laws have all been dead letters, tho all, except the special act in New Jersey, still stand on the statute-books.

State Boards

A second group of state laws includes those which provide for permanent district or county boards established by private parties. These are as follows: Pennsylvania (1883), Ohio (1885), Iowa (1886), and Kansas (1886). The characteristic features common to all of these are: (1) Provision for permanent tribunals established jointly by employers and employees; (2) licensing of such tribunals by local civil courts and endowment of them with power to compel the presence of witnesses and the production of evidence; (3) provision only for voluntary arbitration by such tribunals. The only tribunal ever established under any of these laws was active in connection with the coal trade in Pennsylvania, and had considerable success for a couple of years (1883–85).

In a third group of state laws are five providing for arbitration or conciliation through the mediation of state commissioners of labor: Colorado (1887), Missouri (1889), North Dakota (1890), Washington (1903), and Maryland (1904). The more important characteristics of these laws are as follows: (1) In three states (Colorado, North Dakota, and Washington) mediation by the commissioner is provided for only upon application from a party to the disputes; but in the other two (Missouri and Maryland) there is provision for mediation upon the initiative of the commissioner; (2) in Colorado and North Dakota mediation with a view to conciliation only is contemplated, in Missouri both conciliation and arbitration are specified, and in Washington and Maryland conciliation, arbitration, and public investigation of disputes are provided for; (3) arbitration, where provided, is to be by a board with members chosen in equal numbers by the parties, and an odd member selected by the others, except in Missouri where the commissioner is to be the odd member, but public investigation is in each case to be by the commissioner. Concerning results accomplished under these provisions, nothing was ever done in North Dakota, and after a year the provision was repealed. Very little was ever accomplished in Colorado, and a state board of arbitration was established there in 1897. Somewhat more has been accomplished in Missouri, tho there, too, the provision has been practically

superseded by a state board established in 1901. In Washington, in the ten last months of 1904, the commissioner intervened in twelve disputes (ten strikes and lockouts) and secured settlements in six, one by arbitration, the others by conciliation. The law of Maryland, which gives the commissioner the broadest powers for intervention of any, is still too recent to afford evidence as to results in practise.

Special Commissions

By far the largest and most important group of American state laws includes those which create a special board or commission for the settlement of industrial disputes. These are to be found in the following seventeen states: New York and Massachusetts (1886), Montana (1887), Michigan (1889), California (1891), New Jersey (1892), Ohio (1893), Louisiana (1894), Connecticut, Illinois, Minnesota, and Wisconsin (1895), Utah (1896), Colorado, Idaho, and Indiana (1897), and Missouri (1901). The laws of New York and Massachusetts, where state boards were first established, are the sources from which most of the other states have drawn nearly all the provisions of their laws. The fundamental features of the state-board laws, as they now stand, may be summarized as follows: (1) All the boards consist of three or five members, except in Indiana and Idaho where the permanent commission comprizes two members. The members are appointed by the governor, except in New York where, as the result of a consolidation of departments in 1901, the board consists of the commissioner of labor, appointed by the governor, and the two deputy commissioners, appointed by the commissioner.

All but four states (Connecticut, Michigan, New Jersey, and New York) specify equal representation of employers and employees on the board, and five states (Connecticut, Idaho, Illinois, Indiana, and Utah) require bipartizan political representation. (2) Three procedures are specified for boards —mediation for conciliation purposes, arbitration, and public investigation. Mediation is specified for all save the California board, and is made the duty of all those boards in case of actual or threatened strike or lockout. Arbitration is specified for all the boards, but is always voluntary, tho six states (Colorado, Idaho, Illinois, Indiana, Missouri, and Ohio) make some provision for the enforcement of awards. For purposes of arbitration there is to be added to the state commission in Idaho and Indiana the circuit judge of the county. Public investigation of more serious or stubborn disputes is specified for all the boards, except in Utah, and the authority to make such investigations may be exercised of the board's own motion, except in California where request from one of the parties to the dispute is necessary. (3) With the single exception of California, all the states confer upon their boards some authority for the purpose of compelling the presence of witnesses and the production of evidence.

Results

Turning to results accomplished by state boards, all of the seventeen statutes providing for them still stand on the statute-books, and under all of them boards have been at some time established. In nine states, however, the boards have displayed little or no activity. These nine states are California, Colorado, Connecticut, Idaho, Louisiana, Michigan, Minnesota, Montana, and Utah. In the other eight states—Illinois, Indiana, Massachusetts, Missouri, New Jersey, New York, Ohio, and Wisconsin—the boards have records of considerable activity ever since their establishment. Among these the leading one, certainly at present, is the Massachusetts board, and the following summary of its work is given as the best example of what has been accomplished by state boards in this country:

Year	Interventions		Settlements				
	Total number	In strikes and lockouts	By conciliation	By arbitration	By decision on submission by one party	By public investigation	Total
1886 (4 mos.)	4	2	1	1	..	..	2
1887 ..	21	10	7	9	..	..	16
1888 ..	41	31	12	9	1	2	24
1889 ..	23	15	9	6	..	..	15
1890 ..	34	27	8	5	1	1	15
1891 ..	29	20	9	7	..	..	16
1892 ..	40	25	7	8	1	..	16
1893 ..	32	23	8	4	..	..	12
1894 ..	38	23	7	8	..	..	15
1895 ..	32	19	5	10	..	..	15
1896 ..	29	15	4	11	..	..	15

Total .	943	563	229	224	4	3	460

The Massachusetts board has been notably successful in arbitrations, especially in recent years. Nearly all of these have been on wage questions in the great boot and shoe industry of the state, where the board is held in so favorable an estimation that many agreements between employers and employees provide for reference to the state board when the parties cannot agree.

Bureau of Labor*, September, 1905.

The first French Conseils des Prud'hommes was constituted at Lyons in 1806 in the silk trade.

Dates and Statistics

The first permanent board of conciliation was organized in 1860 in Nottingham, England, in the hosiery and glass trade, largely through the efforts of A. J. Mundella. Palgrave's "Dictionary of Political Economy" gives the following detail of the board established in 1869 in the manufactured iron trade of the north of England:

> The men belonging to the different works select in each case by ballot a delegate, and the employers belonging to a single firm are similarly represented by a single delegate. The members of the board thus constituted elect a president, together with one secretary, from among the delegates of the masters, and a vice-president, together with a second secretary, from among the delegates of the men. They also elect a standing committee, as it is called, consisting of five representatives of the men and ten representatives of the masters (five of whom alone are able to discuss or vote on any question); and of this committee the president and vice-president are ex officio members, without enjoying any power of voting. The standing committee meets every month, or, if occasion demands, more frequently, and the board itself meets twice a year and at other times when summoned by the committee. In the first instance, all questions are laid before the committee. They are submitted in writing to the secretaries seven days before the meeting; the written reply of the other side is usually placed before the same meeting, and an agreement of submission signed by the parties concerned. If the standing committee cannot arrive at an agreement, the referee, who is a permanent official, is called in and can take evidence; and in this way all questions may be settled, except a general advance or reduction in wages, or the appointment of an arbitrator. These questions the board alone can decide, and it also determines matters referred to it from the standing committee, selecting an arbitrator if it cannot itself arrive at an agreement. The necessary expenses of the board are defrayed by the subtraction of a penny every fortnight from the wages of every workman earning upward of half-a-crown a day, and by requiring each firm to pay an amount equal to that thus subtracted from the wages of employees.

In Australia the Federated Seamen's Union drew up a scheme for a board of conciliation which was accepted by the Australasian Steamship Owners' Association in 1889.

In the U. S. the first recorded instance of arbitration was at the beginning of the eighteenth century, when a copper arbitration board was established in the mines of Simsbury, now called East Granby, in Connecticut. The next recorded attempts at a peaceful settlement of industrial disputes were those of the Sons of Vulcan between 1865 and 1876. On Feb. 13, 1865, a Committee of Boilers met a Committee of Iron Manufacturers and agreed upon a sliding scale of wages, thus to this extent forming a board of conciliation. (See AMALGAMATED ASSOCIATIONS OF IRON AND STEEL WORKERS.) In 1870 some of the shoe manufacturers of Massachusetts formed a committee of five to meet with the committee of the Knights of St. Crispin, and to draw

up a scale of wages for the ensuing year. This was the first board of arbitration or conciliation in Massachusetts.

In 1878 Mr. Joseph D. Weekes was sent to inspect the English boards of conciliation and on his return presented a report to the Governor of Pennsylvania. The result was the Wallace Act of 1883, by which voluntary boards of arbitration might be established in Pennsylvania.

In New York City the Church Association for the Advancement of the Interests of Labor, a Protestant Episcopal organization, organized a Council of Conciliation and Mediation, in 1903, with Bishop Potter as its president, and with one workingman and one business man as other members. It has been active and useful on more than one occasion.

Recent Statistics

In Great Britain in 1905, sixty-six permanent boards of conciliation and arbitration considered 1,726 cases, of which 834 were withdrawn, referred back, or settled independently of the boards; 614 were settled by the boards or committees; 225 by arbitrators or umpires appointed by them; and fifty-three remained over, under consideration.

Of the 358 disputes referred to above, under strikes and lockouts, which caused a stoppage of work, thirty, involving directly 10,546 work people, or 15.6 per cent of the total for all disputes, were settled by conciliation or arbitration. The work people involved in stoppages settled by arbitration formed 3.3 per cent of the total number involved during the year, and the proportion involved in disputes arranged by conciliation 12.3 per cent.

In Germany two kinds of conciliation tribunals exist—the Courts of Arbitration for the gilds of handicrafts, and the Industrial Courts for the rest of the working classes. There were 411 Industrial Courts in Germany at the end of 1905. During the last five years these courts acting as conciliation boards were able to settle 51 per cent of the disputes referred to them, the extremes being a maximum of 86 per cent (1905) and a minimum of 27 per cent (1902).

In France recourse to conciliation is almost invariably on the requisition of the work people, or on the initiative of a justice of the peace. In a considerable percentage of cases the offer of mediation is refused (34 per cent of the total for 1901–5), for the most part by the employers. Where conciliation committees are formed by consent of both sides, however, a successful issue appears to be reached in a large proportion of cases (over 60 per cent of the cases of actual reference in 1901–5).

In Holland the Chambers of Labor are the official boards of conciliation. In 1899 these took part in thirteen cases of negotiations concerning terms of employment. In 1903 that number had increased to seventy-three, the total number of such cases during the five years 1899–1903 being 242.

Italy has kept close to the old French institution of the Conseils des Prud'hommes, which France itself has found unsuited to the adjustment of industrial disputes. The Italian Courts of *Probi Viri* are established by royal decree, but no great number of these courts appear to have been formed, and their interventions in disputes have been few (forty-three during the seven years 1897–1903), tho, on the other hand, they have, almost without exception, intervened successfully.

In the U. S. the state boards intervene far oftener on their own initiative than by invitation. Of sixty-three cases of intervention in New York State in 1902–4, fifty were on the initiative of the Conciliation Board. In Ohio the board took the initiative in fifty-one out of fifty-seven cases of intervention during the three years 1901–3. In Indiana during 1902–4 the State Labor Commission took the initiative in eighteen out of a total of twenty-one interventions. In Massachusetts during the same period the board intervened of its own initiative 171 times out of a total of 395 cases. Considering that these conciliation boards offer their services so often without invitation, the number of successful interventions is considerable. The figures for the last three years covered by the returns show 36.5 per cent of successes in New York, and 67 per cent in Massachusetts.

ARBITRATION, INTERNATIONAL: See International Arbitration.

ARBOR DAY: A certain day in the year appointed by different states in the United States, on which people, and especially school-children, are asked and encouraged to plant trees in order to counteract the tendency to forest extermination. (See Forestry.) The Nebraska State Board of Agriculture established the first Arbor Day in 1879. To-day it is appointed in almost every state and territory, and usually falls late in April or early in May.

ARBOUX, DAVID LOUIS ISAAC JULES: French chaplain; born at Montauban, Nov. 20, 1847; went to Paris in 1868, and was with Martin Paschon, president of the consistory of the Reformed Church of England in that city. He took active part in the Franco-German War. In 1873 he was appointed and has since remained Protestant chaplain of the prisons on the Seine; and he is a member of the Board of Directors of Prisons in General. Arboux has written various works on prisons, and also on socialistic subjects.

ARCH, JOSEPH: English labor leader; born 1826; leader of the English agricultural laborers' movement (1870–88), and founder of the National Agricultural Laborers' Union (1872), of which he became president. He was the son of a laborer, and worked on the farm from an early age. For some years he used his spare time preaching for the Primitive Methodists, and when the movement began among the agricultural laborers he used his talent in their behalf, soon being recognized as a leader. Four times a candidate for parliamentary honors, he was successful as the nominee of the Liberal Party for northwest Norfolk in 1885, 1892, 1895, and 1900, after a defeat in 1886.

ARGYRIADES, PANAGIOTES: French Socialist; lawyer; born in Kastoria, Macedonia, 1832. He practised law in Paris, where he founded *La Question Sociale* and *L'Almanach de la Question Sociale*. Argyriades, who was a militant propagandist, died in 1901.

ARISTOCRACY: Term which, literally, means government by the best; but in ordinary use "the best" means simply "the highest in rank and in opulence"; so that the word has come to mean a government where the supreme power is exercised by those highest in station, inheritance, blood, or wealth. With the word used in this sense, it is generally claimed that the United States is to-day more of an aristocracy than of a democracy. Dr. Josiah Strong, in "Our Country," wrote, even in 1885:

> Every nation has its aristocracy. In other lands the aristocracy is one of birth; in ours it is one of wealth. It is useless for us to protest that we are democratic, and to plead the leveling character of our institutions. There is among us an aristocracy of recognized power, and that aristocracy is one of wealth. No heraldry offends our republican prejudices. Our ensigns armorial are the trade-marks. Our laws and customs recognize no noble titles; but men can forego the husk of a title who possess the fat ears of power.

Some claim that this power of wealth goes to the ablest, but against this assertion may be quoted the following extract from an article by John Stuart Mill (*Fortnightly Review*, February, 1879):

> The very idea of distributing justice, or of any proportionality between success and merit or between success and exertion, is in the present state of society so manifestly chimerical as to be relegated to the regions of romance. It is true that the lot of individuals is not wholly independent of their virtue and intelligence; these do really tell in their favor, but far less than many other things in which there is no merit at all. The most powerful of all the determining circumstances is birth. The great majority are what they were born to be. Some are born rich without work, others are born to a position in which they can become rich by work, the great majority are born to hard work and poverty through-

out life, numbers to indigence. Next to birth the chief cause of success in life is accident and opportunity. When a person not born to riches succeeds in acquiring them, his own industry and dexterity have generally contributed to the result; but industry and dexterity would not have sufficed unless there had been also a concurrence of occasions and chances which falls to the lot of only a small number. If persons are helped in their worldly career by their virtues, so are they, and perhaps quite as often, by their vices; by servility and sycophancy, by hard-hearted and close-fisted selfishness, by the permitted lies and tricks of trade, by gambling speculations, not seldom by downright knavery. Energies and talents are of much more avail for success in life than virtues; but if one man succeeds by employing energy and talent in something generally useful, another thrives by exercising the same qualities in outgeneraling and ruining a rival. It is as much as any moralist ventures to assert, that, other circumstances being equal, honesty is the best policy, and that with parity of advantages an honest person has better chances than a rogue. . . . The reward, instead of being perfectioned to the labor and abstinence of the individual, is almost in reverse ratio to it; those who receive the least labor and abstain the most.

ARISTOTLE: Greek philosopher; born at Stageira 384 B.C.; died in 322. He was a pupil of Plato at Athens, and is said to have been called "the intellect of the school." After Plato's death (347 B.C.) Aristotle left Athens, and in 342 B.C. was invited to Macedonia by Philip, and became the teacher of Alexander. He remained here till Alexander started on his Asiatic expedition (334 B.C.), when he returned to Athens and opened a school called the Lyceum, and (from his practise of walking as he lectured) the "Peripatetic" school. He died at Chalcis in Eubœa, aged sixty-two. His main works are the "Nicomachean Ethics," "Organon" or "Logic," "Rhetoric," "Poetics," "Physics," and "Politics." His knowledge for his times was encyclopedic. His thorough knowledge of facts made him much more concrete and scientific, and as objective as Plato was idealistic and subjective. The following summary of his economic and sociologic positions is abridged from Professor Ingram's "History of Political Economy," p. 16:

Aristotle, like all the Greek thinkers, recognizes but one doctrine of the State, under which ethics, politics proper, and economics take their place as departments, bearing to each other a very close relation, and having, indeed, their lines of demarcation from each other not very distinctly marked. When wealth comes under consideration, it is studied not as an end in itself, but with a view to the higher elements and ultimate aims of the collective life.

The origin of society he traces not to economic necessities, but to natural social impulses in the human constitution. He opposes the suppression of personal freedom and initiative, and the excessive subordination of the individual to the State, and rejects the community of property and wives proposed by Plato for his governing class. The principle of private property he regards as deeply rooted in man, and the evils which are alleged to result from the corresponding social ordinance he thinks ought really to be attributed either to the imperfections of our nature or to the vices of other public institutions. Community of goods must, in his view, tend to neglect of the common interest and to the disturbance of social harmony.

Of the several classes which provide for the different wants of the society, those who are occupied directly with its material needs—the immediate cultivators of the soil, the mechanics and artificers—are excluded from any share in the government of the State, as being without the necessary leisure and cultivation, and apt to be debased by the nature of their occupations. In a celebrated passage he propounds a theory of slavery, in which it is based on the universality of the relation between command and obedience, and on the natural division by which the ruling is marked off from the subject race. He regards the slave as having no independent will, but as an "animated tool" in the hands of his master; and in his subjection to such control, if only it be intelligent, Aristotle holds that the true well-being of the inferior as well as of the superior is to be found. This view, so shocking to our modern sentiment, is of course not personal to Aristotle; it is simply the theoretic presentation of the facts of Greek life, in which the existence of a body of citizens pursuing the higher culture and devoted to the tasks of war and government was founded on the systematic degradation of a wronged and despised class, excluded from all the higher offices of human beings, and sacrificed to the maintenance of a special type of society.

Like the other Greek social philosophers, Aristotle recommends to the care of governments the preservation of a due proportion between the extent of the civic territory and its population, and relies on antenuptial continence, late marriages, and the prevention or destruction of births for the due limitation of the number of citizens, the insufficiency of the latter being dangerous to the independence and its superabundance to the tranquillity and good order of the State.

Aristotle's economic and social ideas are found almost exclusively in his "Politics." The following quotations give some of the salient points:

It is evident that the State is a creation of nature, and that man is by nature a political animal. The State is, by nature, clearly prior to the individual and to the family, since the whole is of necessity prior to the part. . . . The proof that the State is a creation of nature, and prior to the individual, is that the individual, when isolated, is not self-sufficing; and, therefore, he is like a part in relation to the whole. But he who is unable to live in society, or who has no need, because he is sufficient for himself, must be either a beast or a god. He is no part of the State. A social instinct is implanted in all men by nature, and yet he who first founded the State was the greatest of all benefactors ("Politics," i., 2).

There are many difficulties in the community of women, and the principle on which Socrates rests the necessity of such an institution does not appear to be established by his arguments (ii., 1).

Property should be in a certain sense common, but is as a general rule private; for when every one has a distinct interest, men will not complain of one another, and they will make more progress because every one will be attending to his own business (ii., 5).

The beginning of the reform is not so much to equalize property, but to train the noblest sort of natures not to desire more, and to prevent the lower from getting more; that is to say, they must be kept down but not ill-treated (ii., 7).

ARMSTRONG, SAMUEL CHAPMAN: General, philanthropist, educator; born in Hawaii in 1839; son of an American missionary; educated in Hawaii and at Williams College, Williamstown, Mass. In 1862 he joined the army and served through the war, afterward accepting a position in the Freedman's Bureau. He enlisted the American Missionary Association in the cause of negro education, and founded the Hampton Normal and Agricultural Institute (1868), at Hampton, Va., devoting the remainder of his life to this undertaking. He died in 1893.

ART AND SOCIAL REFORM: Art meant originally skill in fitting. The artist was simply the skilled workman, and not different from the artizan. He was the man who could make good houses to live in, and particularly good houses in which to enshrine the public's ideals, good temples, baths, etc. He was one who could make good furnishings for the houses—good chairs, good vases, good mosaics, good statues and pictures of the gods. Art was thus developed as soon as and to the extent to which the community was lifted above absolute want and the struggle for mere physical existence—i. e., as soon as people had opportunity to think of the quality as well as the quantity of its work. Hence the great art periods of a nation have been either when the nation was rich and prosperous (e. g., the age of Phidias in Athens, The Renaissance in Italy and France, the age of Merry England), or when the people were at least enjoying the fruits of victory or of success in any line (e. g., periods of Gothic art). If, however, a nation becomes wealthy, not by conquest or slow growth, but by producing commodities and selling them, it is evident that the nation will not produce a great art, because it will be compelled to think more of the quantity than the quality of its work; or, if it think of quality, it will think mainly of commodities as

fitted to sell. The rich nations of to-day being commercial nations, we need not be surprized to hear artists complaining of the real dearth of art, altho we have in England and America phenomenal wealth. It is evident, from this consideration alone, how social conditions can affect art. We shall in a moment see how art can affect social conditions. For the moment, however, we must notice another point. If art be the production of commodities worthily expressing a nation's aspirations—public buildings, statues, and pictures of its gods, its heroes, its ideals of beauty and of power—it will follow that it will attain to high development where *hand*-work is largely practised, since this allows the expression of ideals; and conversely it will attain meager development where machine-work prevails, since this does not allow of much expression of ideals. Here, too, remembering that the present age is characterized by machine production, we see a very potent cause for the present dearth of art.

Once again, when a community becomes divided into two classes, one having leisure and wealth and not producing commodities, the other class poor and doing the productive work, a desire for art will spring up amid the leisure class and not in the other. But since the leisure class does not itself produce, the desire will not create art, but a dilettante, artificial, unnatural desire for art; while the producing class, not having leisure, and being compelled to think mainly how to get a bare existence, will not be able to produce art; especially when the nation's production is mainly carried on by machinery. In such a community the artist will come to be considered very different from the artizan. The artist will usually become an affected idler and the artizan an unartistic "hand." It is only too evident that this is the state of affairs to-day. Such are but some of the ways in which social conditions affect art.

Influence of Social Conditions

Let us now see some of the ways in which art affects social conditions. Art we have seen to be the producing of good work. Now, when a community thinks a great deal of producing good work—good houses and furnishings for houses, worthy temples, public buildings, baths, etc.—it follows inevitably that the people do not think so much of merely producing commodities to sell. As a people primarily commercial cannot be primarily artistic, so a people primarily artistic cannot be primarily commercial. It raises a different ideal. The ideal of good work operates in various ways. It produces a demand for leisure in which to do the work. An artistic nation will never live in a hurry. It will seek freedom in which to work. It will not endure great factories and machine-made work. It is a fact that almost all the great artists and poets and idealists to-day are among the bitterest foes of the commercialism and mammonism of the present time, and are, for the same reason, among the most earnest workers for social reform. A high and uncommercial social development develops art, and the art demands and calls for social reform, thus producing action and reaction. Thus, great artists like William Morris and critics like John Ruskin are never weary of condemning the shoddy work and commercialism and baseness and ugliness which characterize so much of modern life. Nor are they ever weary of comparing it, to the damage of the present, with the beautiful work of ages when commerce was not a god, and when machines had not crowded people into slums, nor prevented expression entering into the work of the producer. A somewhat smaller number of artists, poets, and idealists, and especially the greatest among them, are equally ready to work not for "the good old times," but to bring in the better new times, when machines shall not be abandoned, but when brotherhood shall rule in society, making all classes workers, but giving to all classes immunity from the mere struggle for bare existence. They long for the day when all men shall have time to think of producing good work, using machinery indeed, but using it mainly in producing materials to be worked upon and made beautiful by the free hand expressive of the free creative soul.

Particularly have William Morris and Walter Crane, two English artists of genius, thought deeply and written suggestively on the relation of art to social reform. Morris's life was revolutionized by his sense of the importance of this relation. Until the age of fifty he lived, as many artists live, in aristocratic seclusion, absorbed in poetry and the decorative arts. In his "Earthly Paradise" he confest that he was but "the idle singer of an empty day." And then, at an age when most men would consider their work done, he was impelled to study social problems, and became an ardent Socialist, writing Socialist articles, tracts, and poems, lecturing in the open air in London's parks, and serving on Socialist committees. In a lecture on "Art and Socialism," he has given us, in these pregnant words, his social-artistic creed:

Morris and Crane

> I put forward a claim on behalf of labor enslaved by commerce, which I know no thinking man can deny is reasonable, but which if acted on would defeat commerce; that is, would put association in the stead of individualist anarchy.
>
> I have looked at this claim by the light of history and my own conscience, and it seems to me so looked at to be a most just claim, and that resistance to it means nothing short of a denial of the hope of civilization.
>
> This then is the claim:
>
> *It is right and necessary that all men should have work to do which shall be worth doing, and be of itself pleasant to do; and which should be done under such conditions as would make it neither overwearisome nor overanxious.*
>
> Turn that claim about as I may, think of it as long as I can, I cannot find that it is an exorbitant claim; yet I say if society would or could admit it, the face of the world would be changed; discontent and strife and dishonesty would be ended. To feel that we were doing work useful to others and pleasant to ourselves, and that such work and its due reward *could* not fail us! What serious harm could happen to us then? And the price to be paid for so making the world happy is revolution.

When Morris died, his mantle fell on Walter Crane more than upon any other single man. Crane, too, is an active Socialist. Some of his best cartoons have been made for the Socialist press, and he is a familiar figure at London Socialist gatherings. In an essay in his book, "The Claims of Decorative Art" (1892), he writes as follows on "The Prospects of Art Under Socialism":

> Socialism presents a new ideal to humanity. It is a religion and a moral code, as well as an economic system. Its true realization would mean unity of public sentiment and the sympathy of a common humanity freed from the domination of class and the grinding conditions of commercial competition. Such an atmosphere could not but be favorable to art in the highest degree.
>
> Not only would the common property in the beauty of nature not be allowed to be disfigured for the purposes of private gain, but with leisure and security of living it would not be a question, as it is now so often, with the artist or craftsman, hindered, in pursuing his higher aims, and in seeking perfection in his craft, by the cramping consideration that it will not pay.
>
> And what is true of art work is, after all, true of all work.

A profit-grinding system must of necessity be against the best in all ways.

Greater simplicity and dignity of life, too, which would naturally result from a juster distribution of wealth, would have its effect on both art and architecture, and would find expression in simpler and sincerer forms of construction and ornament.

If we imagine a truly socialized community—a state of equal condition (not necessarily of mental capacity or other quality) wherein every able-bodied member served the community according to his capacity, it might necessitate a portion of time (determined by the numbers of the community and their necessities) being spent in some form of manual labor. This in itself would be an advantage and physical benefit to each individual; nor so long as enough leisure was secured would mental capacity be likely to suffer, in its true sense, or the art instinct or capacity either—on the contrary. There is nothing, after all, like close intimacy with nature and fact to strengthen the character all round, and clear the mental vision of morbid states; and as for art, like the wrestler, it always gains new vigor every time it touches the ground—the ground of common nature and common life. . . .

The type of artist—supposing artists existed as a class or order in a socialistic community—most likely to be fostered would, I think, be probably such as that represented by the master craftsmen of the Middle Ages, such as Albert Dürer or Holbein, for instance—men capable of design in all kinds of materials, who could design a building, make the pattern of a jewel or a gown, draw a title-page or paint a portrait. What may be called, in short, the all-round artist would be likely to be more in demand than the specialist more or less fostered under present conditions.

The essence of art is harmony and unity. Before we can hope to get harmonious art and thought, therefore, we must realize harmony and unity in life.

William Morris and Walter Crane are, however, but the two most prominent representatives of artistic tendencies that are worldwide. Before their time, and without their definite Socialist tendencies, Jean François Millet had stirred the heart of all mankind with his delineations of French peasants—dull victims of age-long oppression. And since Morris and Crane began their work, Constantin Meunier, the Belgian sculptor, has stamped on the imagination of his age the somber and tragic figures of mine- and factory-workers. Two other of the great English artists of the past generation, George Frederick Watts and Sir Edward Burne-Jones, felt at least something of the social tragedy of our time, and prefigured it in their art. All over the Continent of Europe, younger artists are now working along socialistic lines. The most talented, perhaps, of these younger men is E. M. Lilien, of Berlin, a Jewish black-and-white artist, who has illustrated Rosenfeld's "Songs of the Ghetto" with haunting power, simplicity, and pathos. The *Wahre Jacob* of Stuttgart, and the socialistic papers of Italy and France often bear striking witness to the influence of humanist ideals on the new generation of artists.

Meunier, Watts, Burne-Jones, Lilien

The impress of the social spirit on the broader art, which includes not merely pictures, but also poetry, music, the drama, and literature, is a challenging portent in our age. Shelley's ethereal song was colored by a spirit of intense social revolt. Richard Wagner, the greatest figure in modern music, was in his earlier life a rebel and a revolutionist, and has written voluminously of his subversive social ideals. Henrik Ibsen, the greatest figure in the modern drama, remained throughout his life an unsparing critic of modern society. Victor Hugo's "Les Miserables," probably the greatest novel of the nineteenth century, is a poignant revelation of that nether world which is not far from us all. Sudermann and Hauptmann, the leading German dramatists of to-day, Maeterlinck, the Belgian poet and playwright, G. Bernard Shaw, the English satirical dramatist, Tolstoy, the Russian novelist, and Maxim Gorky, this latest and menacing figure who comes to us "out of the depths" —are all preoccupied with social problems.

Literature, Poetry, Drama

Here in America the ideal of a new society has fired the souls of our most important writers. Whitman's "Leaves of Grass" has become the Scripture of the democratic movement in its largest sense. The dean of American novelists, William Dean Howells, has known the lure of the social ideal, and at one time it looked as if he, like his friend Edward Bellamy, might abandon literature for socialism. Edwin Markham leapt into fame with a poem that voiced the bitter cry of "The Man with the Hoe." Jack London, the most brilliant of our younger men of letters, is a militant Socialist: and Upton Sinclair's "The Jungle," a Socialist novel dealing with the horrors of the Chicago slaughterhouses, has done for wage slavery something of what Harriet Beecher Stowe's "Uncle Tom's Cabin" did for chattel slavery.

It is not difficult to understand why the social problems of our day grip the heart of the artist. In the deepest sense, the social instinct and the artistic instinct are one. The instinct that drives men on to the achievement and realization of perfect social forms is the same as that which impels the artist to express himself in poems, statues, and paintings. The true reformer is a social artist molding the rough materials out of which shall come a new and radiant world. In the degree that he fulfils his mission, he becomes truly godlike, creating and shaping the universe anew.

ARTHUR, PETER M.: Late head of the Brotherhood of Locomotive Engineers in the United States; born in Scotland, 1836; came to America when ten years old. He was employed in an engine-house in various capacities, until at length he became an engineer. Early interested in the organization of his craft, he was in 1874 elected to its highest office, being reelected annually until his death. Under him the Brotherhood became one of the most powerful altho most conservative trade-unions in the country, numbering some 30,000 men. He was much criticized by many in the labor movement for not being more willing to combine with other labor organizations. Arthur regarded himself as the head of a business corporation formed to subserve the interests of its members; and he felt that, however he or any one else might personally look upon any matter, his plain duty was to serve only those who had placed him at the head of their organization. He died in 1903.

ATELIERS NATIONAUX: National workshops; a term used in France for the workshops established by the Provisional Government of France in the Revolution of 1848, to give work to the unemployed.

The Provisional Government had scarcely been established (in February, 1848), when a committee of Socialists demanded of it the recognition of the right to work. Louis Blanc and one or two others were the only real Socialists in the government, and the demand of the men was only reluctantly conceded, for political reasons. Louis Blanc says distinctly that the government nominally yielded, but appointed a committee secretly instructed to make the experiment fail, and the most cursory examination of the evidence shows that it is impossible to judge correctly of the *ateliers nationaux* on the supposition that they were merely a *bona fide* effort to carry out the decree establishing the "right to work."

Louis Blanc advocated the formation of a ministry of labor, but this was negatived. In place of it, as a compromise, a government labor commission, under the presidency of Louis Blanc, was established, with power of inquiry and consultation only. Meanwhile, the carrying out of the decree by the establishment of national workshops was confided not to this commission but to the Minister of Public Works, M. Marie. This was followed the next day by a decree specifying various public works to be started. Besides the works organized by the Minister of Public Works, the Minister of War opened works in the Champs de Mars. All went well while the number of the unemployed was less than 6,000, but as soon as that number was exceeded the workmen of each *arrondissement*, after having visited all the open works in succession without result, returned to their *maire's* offices tired, starving, and discontented. Louis Blanc, resigned and publicly denounced the scheme as not being conducted in good faith. Each *maire's* office was authorized to pay every unemployed workman 1.50 francs per day on production of a ticket showing that there was no vacancy for him in the national works. The fixed sum of two francs was paid to any workman engaged on the public excavation works, without regard to his age, the work done, or his calling. The workman, therefore, made the following simple calculation, "The state gives me thirty sous for doing nothing; it pays me forty sous when I work, so I need only work to the extent of ten sous."

Louis Blanc Denounces the Scheme

As the numbers claiming work or relief rapidly increased, both the bureaus and the *maires'* offices became the centers of tumultuous crowds. Therefore, Émile Thomas, a chemist connected with the *École Centrale*, was commissioned by M. Marie to reorganize the works on a complicated and absurd semimilitary plan. When Émile Thomas took the work in hand, the number of unemployed in Paris was estimated at from 13,000 to 14,000, in addition to 4,000 or 5,000 already engaged on public works. This number continued steadily to increase day by day, without, however, any corresponding expansion of the public works. After a meeting of the chief engineers, who were unable to suggest means of employing usefully more than a few hundred of the 14,000 unemployed men, it was resolved to undertake a series of works in the plain of Monceaux, which, if serving no other object, would at least have the advantage of keeping the crowd employed. Already the whole scheme was costing 20,000 fr. a day, and measures were contemplated for reducing and finally extinguishing the pay to the idle.

Political feeling between the Moderates and the Extremists was already running high in view of the elections which were fixt for April. The strength of the former centered in the Hôtel de Ville, that of the Socialists in the Luxembourg. The national works depended politically on the Hôtel de Ville. From this time it becomes progressively more difficult to treat the works as a purely economic experiment. That the administration of the works was on an altogether unnecessary scale is not denied even by the director, who, however, declared that he was continually under the necessity of finding places for crowds of applicants sent to him with recommendations which he could not resist. Thus a large number of actors, painters, commercial clerks, and others, thrown out of work by the crisis, having been refused tickets for admission to the works as not wearing the workman's blouse, were employed by the director as pay agents.

The National Assembly met on May 4th. Louis Blanc renewed his motion for a minister of labor, which was rejected On the 15th the Assembly was invaded by the mob, and from that time the antisocialist tendency of the government became more marked. The new government immediately determined to reduce and suppress the national works, which were draining the treasury and demoralizing the people, and which were suspected of being centers of intrigue on the part of Louis Bonaparte. The result was the bloody insurrection of June 23d and following days, which was only suppress after three days of street fighting. Soon after Louis Napoleon was elected President of the Republic. The gigantic schemes subsequently carried out under the Second Empire for the rebuilding of large parts of Paris served for many years to provide employment for Paris workmen, and while they lasted formed an effective substitute for the ill-fated national works.

ATHENS, SOCIAL POLITY OF CLASSIC: Greek social thought centered around the state, and the state usually meant the municipality, or the city (hence, *political economy*, the economy of the city). Of this policy Athens under Pericles was the most brilliant example. In the first place, it was, *with the exception of its slave basis*—of which we shall speak later—to a large extent democratic. Even during the kingly or traditional period, there seems to have been recognition of the popular power in the brotherhoods (*φρατρίαι*) and clans (*γενη*), believed to rest, and probably actually resting, on consanguinity. This largely disappeared under the Eupatrids, but was more than revived by Solon. He established the *εκκλησία*, or assemblies of the whole people, to elect the archons and councilors; to judge the former at the annual expiration of their office; and to accept or reject all the laws and decrees proposed by the council. (See REFERENDUM.) Under Clisthenes all free inhabitants of Attica were admitted to citizenship. This, however, is the least interesting of Athens' sociological features.

Mr. W. D. P. Bliss, in *The Outlook* (Nov. 11, 1905), has argued that socialism was virtually tried in Athens, under Pericles. This was the exact period of Athens' greatest glory and of the production of individualities so great that Francis Galton, of the highest authority in anthropological science, says: "A population of 90,000 produced two men, Socrates and Phidias, whom the whole population of Europe has never equaled, and fourteen men of an ability of which the Anglo-Saxon race has only produced in 2,000 years five equals." He asserts that the average ability of the Athenian race was about as much above that of the English race as that race is above the African negro. J. A. Symonds favorably quotes this, and says that the population of classic Athens, taken as a whole, was perhaps as superior to ours as our race is to that of the Australian savage. This Mr. Bliss considers mainly due to Athens' socialism, of which he says, in substance:

It practically asked from each citizen according to his ability, and gave to each according to his need. This was accomplished in the main by two institutions: the so-called "liturgies," securing from the rich gratification for the less fortunate, and above all by the "dicasticon," or daily money payment for public service, given to practically any citizen who wished it, and in quantity sufficient to enable him to live upon it in respectability and ordinary comfort. It was the latter institution which above all made Athens socialistic. It was introduced by Pericles, as we may clearly learn, among other sources, from Aristotle ("Politics," ii., 12) and Plato ("Gorgias," 575). We will consider the latter first.

Socialism

The dicasticon was the daily money payment, first of one obol and later of three, to any Athenian citizen who did duty as a *dicast* or juror in the multitudinous courts of Athens. One obol is three cents—seemingly a small affair, and yet, measured by Athenian prices, sufficient to maintain life in

respectability and comfort, and paid sufficiently frequently to form, Mahaffy tells us ("Old Greek Life," p. 63), "an income on which most of the poorer citizens lived." Professor Boeckh, in his "Public Economy of Athens," estimates that prices in Athens, under Pericles, were at least ten times lower than in modern times. He who received three obols a day therefore received the equivalent of ninety cents to-day. He probably received vastly more compared with modern city prices. It has been calculated that 6,000 persons received the dicasticon each day, supporting perhaps 30,000 persons (including wives and children), or about one third of the free population. And this payment was only the principal one of several similar payments. It was for service in the courts; but for attendance at the *ecclesia*, or popular assembly, to which also any Athenian citizen could go, there was another payment, an *ecclesiasticon*, varying at different times from one to nine obols. Moreover, the city saw to it that her poorest citizen could enjoy the drama and the religious festivities, both of which were considered municipal functions which it was important that every citizen should attend. Therefore the poorest citizens were paid a *theoricon* of two obols for the drama, besides various payments for the different religious festivities. It must be remembered, too, that the greatest Athenians lived in the simplest way. Therefore, those who were paid their three obols a day could not only live, but live as did the best. And all this was the result of its socialistic government. The state was omnipresent. It conducted and maintained the religious rites of the city, the Panathenaic and other festivals. It built and cared for the temples, baths, gymnasia, stoa, theaters, and market-places. It cared for the arts. The Parthenon and the Acropolis were the creation of state artists. The state entered into trade. It owned and operated mines in Thrace and Attica. The silver Laurium mines constituted the first Attic treasury. The revenues of the state were mainly derived, not from citizen-paid taxes, but from woods, pastures, lands, houses, and mines, all owned and operated by the state. The state largely watched over and guided the colonial system, which was almost the ruling feature of Athenian financial life. The state built the wharves and warehouses of the Peiræus; it controlled the weights and measures; it examined balances and minted coin. It entered into distribution, providing food at cheap price in time of want; and it regulated the price of corn.

The result of all this was the high development of the individual. The Athenian was delivered from the necessity to "hustle" for a livelihood. Any Athenian who wished it was allowed to devote his life to money-making. Some did, and accumulated wealth. But such were few, and those few were compelled to spend their money for the public good. The vast number of Athenians preferred, and were encouraged to prefer, higher things. Commerce and trade were generally left to slaves. Athens' "Four Hundred" were devotees of art and philosophy. The state believed in competition, but in the higher life, not in the market. The *liturgies* of the wealthy were used to institute prize games or art contests. Athens' great dramas were prize plays. In economics she practised socialism, and so freed men for the higher life.

Athens fell because she was not moral. Her socialism, we have said, was selfish. Her public men were often corrupt; her family life was impure. Greece, too, was not socialistic. She was at best but a loose federation of competing republics. She fell before a united Macedon, even as Macedon fell before the larger unity of the Roman Empire. Her slavery, too, largely undermined her. The number of these slaves cannot be determined with any certainty. They were scarcely regarded as men, but as the tools or machinery of the day. Yet they had rights. Professor Ingram, writing in the "Encyclopædia Britannica," in the article on "Slavery," says:

Slavery

The condition of slaves at Athens was not in general a wretched one. Demosthenes ("In Mid.," p. 530) says that, if the barbarians from whom the slaves were bought were informed of the mild treatment they received, they would entertain a great esteem for the Athenians. Plautus in more than one place thinks it necessary to explain to the spectators of his plays that slaves at Athens enjoyed such privileges, and even license, as must be surprizing to a Roman audience. The slave was introduced with certain customary rites into his position in the family; he was in practise, tho not by law, permitted to accumulate a private fund of his own; his marriage was also recognized by custom; tho in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves both at Athens and in other Greek centers. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret.

Thus Athens may be looked at from the standpoint of social science in at least two opposite ways. Looking at its free population, it may be considered a socialistic city, and the Socialists may use it as an illustration of great individualities produced, not by competition, but by socialism. Looking at its large slave population and the despite put upon manual labor, Athens may be considered as an oligarchy, intellectual, brilliant, but resting on injustice and immorality.

ATKINSON, EDWARD: American economist; born in Brookline, Mass., 1827; educated principally at private schools. His reputation was made by the numerous pamphlets and papers which he contributed to current literature on economic topics. The subjects treated embrace such general topics as banking, competition, cotton, free trade, mechanical arts, and protection. The most important of his addresses are "Banking," delivered at Saratoga in 1880 before the American Bankers' Association; "Insufficiency of Economic Legislation," delivered before the American Social Science Association; "What Makes the Rate of Wages?" before the British Association for the Advancement of Science; address to the chiefs of the Bureau of Labor Statistics, at their convention in Boston in 1885; vice-presidential address on "The Application of Science to the Production and Consumption of Food," before the American Association for the Advancement of Science, in 1885. Among his pamphlets are the following: "Labor and Capital, Allies, not Enemies" (New York, 1880); "The Railway and the Farmer" (ib., 1881); "The Distribution of Products" (ib. 1885).

In 1886 Atkinson began the preparation of a series of monographs on economic questions, for periodical publication. Through his efforts was established the Boston Manufacturers' Mutual Fire Insurance Company, an association consisting of a number of manufacturers who, for their mutual protection, adopted rules and regulations for the economical and judicious management of their plants. Atkinson invented an improved cooking stove called the "Aladdin cooker." He died December, 1905.

AUER, IGNAZ: German Social Democrat, and member of the Reichstag; born in Dommelstadt, 1846; educated in the public schools; a saddlemaker by profession. From 1874 to 1877 he was secretary of the Social Democratic Party in Hamburg, and from 1877–78 editor of the *Berliner Freie Presse*, and later of the *Hamburger Gerichtszeitung*. In 1877 he was elected a member of the Reichstag for Auerbach, and was reelected in 1880, 1884, and 1890. *Address*: Kreuzbergstrasse, 30, Berlin, S. W., Germany.

AUSTIN, JOHN: English writer on jurisprudence; born at Creeting Mill, Suffolk, England, 1790. He entered the army at the age of sixteen, but after five years returned to London, studied law, and was admitted to the bar in 1818. He was an intimate friend of Jeremy Bentham and of James and John Stuart Mill, and developed an academic rather than a professional career. In 1826 he was appointed professor of jurisprudence in the University of London but had to resign his chair four years later for lack of students who would pay class fees. Austin was a member of the Criminal Law Commission and of a Maltese Commission, but devoted himself mainly to his

writings, best known for their clear tho abstract development of the doctrine of sovereignty. His "Province of Jurisprudence Determined" was published in 1832, while an additional volume, under the title "Lectures on Jurisprudence," was published by his widow (née Sarah Taylor), in 1866. He died in Surrey, England, 1859.

AUSTRALIA: The Australasian colonies comprize the continent of Australia, the adjacent island of Tasmania, and the islands of New Zealand. On Jan. 1, 1901, the five mainland states and Tasmania became the commonwealth of Australia, New Zealand retaining its position as a separate colony.

I.—Statistics

AREA AND POPULATION

STATE	Area in acres	Area in sq. m.	Population, 1903
New South Wales	198,848,000	310,700	1,417,870
Victoria	56,245,760	87,884	1,205,513
Queensland	427,838,080	668,497	523,266
South Australia	578,361,600	903,690	389,727
Western Australia	624,588,800	75,920	254,309
Tasmania	16,778,000	926,215	174,233
Commonwealth of Australia	1,902,660,240	2,972,906	3,964,918
New Zealand	66,861,440	104,471	894,206
Australasia	1,969,521,680	3,077,377	4,859,124

Australasia, including the native races, had in 1903 a density of 1.61 persons per square mile—a rate far below that of any other civilized country. From the earliest years of settlement there was a steady, if not powerful, stream of immigration; but in 1851, memorable for the finding of gold, the current was swollen by many thousands. Immigration was long aided by the State. Recently, however, there has been much emigration, and in 1902–3 emigration exceeded immigration.

The progress of the chief cities has been remarkable, and has no parallel among the cities of the Old World, and rarely in America. The population of the chief cities in 1903 was: Sydney, New South Wales, 511,030; Melbourne, Victoria, 501,460; Adelaide, South Australia, 168,066; Brisbane, Queensland, 124,463; Wellington, New Zealand, 53,082; Perth, West Australia, 46,400; Hobart, Tasmania, 34,682. The cities are well laid out, often beautiful, and provided with museums, art galleries, libraries, etc. All the capitals are liberally supplied with parks and recreation-grounds. In Sydney and suburbs there are parks, squares, and public gardens comprizing an area of 4,598 acres, including 745 acres which form the Centennial Park.

Fully 95 per cent of the people are of British origin. In 1901, the aborigines numbered 40,880 full-blooded and 7,368 half-castes.

Vital Statistics

Of the total male population, 28.65 per cent are married; and of the female, 31.71. The birth-rate in 1903 was 25.16. It has been declining for some years, and in 1903 a royal commission investigated the causes of this and of the mortality of infants. It was found that there had been a serious diminution of fecundity since 1889, due chiefly to deliberate prevention of conception and the destruction of fetal life, and to the consequent pathological causes. Illegitimate births are rather numerous, the total number in the whole of Australasia during 1903 being 6,912, equal to 5.75 per cent of the total births.

The death-rate is 12.07, much below that of any of the European States, and is steadily declining. Every year sees an advance in the sanitary condition of the people in the large centers of population, and to this cause may be ascribed the greater part of the improvement. As to suicides, the experience of Australasia agrees with that of other countries, namely, that the tendency to self-destruction is increasing.

In 1903 the marriage rate was 6.63 per thousand. The following table shows the number of decrees of dissolution of marriage and judicial separation granted in each state in quinquennial periods since 1871, so far as it has been possible to procure the information. Divorce was legalized in New South Wales in 1873, and the figures of that state for 1871–75 only cover the two years 1874 and 1875.

STATE	1871–75		1881–85		1891–95		1896–1902	
	Divorces	Judicial Separations	Divorces	Judicial Separations	Divorces	Judicial Separations	Divorces	Judicial Separations
New South Wales	21	...	116	6	1,087	55	1,675	110
Victoria	33	6	74	8	441	10	700	4
Queensland	4	1	5	2	20	3	62	5
South Australia	22	3	31	10	30	2	42	3
Western Australia	...	...	5	...	9	...	47	1
Tasmania	9	...	9	...	21	2	34	...
New Zealand	*..	*..	*..	*..	101	14	426	25
Australasia	89	10	240	26	1,715	86	2,986	148

During the five years ended 1895 the marriage rate fell considerably in Australasia. It was lower in every state than during the preceding quinquennial period, and lower everywhere than during the five years 1881–85; but during the last five years the rate rose again in every state except South Australia.

In all the Australasian provinces the State system of education is secular. Compulsory clauses find a place in the acts of the various states; but the enforcement of these is not everywhere equally strict. In Victoria, for example, compulsory attendance at school has been rigorously insisted upon, while in Queensland the principle of compulsion has been allowed to remain almost in abeyance, and in the other states it has been enforced with varying degrees of strictness. In Victoria, Queensland, New Zealand, Western Australia, and South Australia, the primary education provided by the State is entirely free of charge to the parents; in New South Wales and Tasmania small fees are charged, but these are not enforced where the parents can reasonably plead poverty. In 1903 there were in New South Wales 2,862 public schools with 243,516 children; and 841 private schools with 58,258 pupils; in Victoria, 1,988 public schools with 251,655 pupils; and 798 private schools with 45,658 pupils; in South Australia, 276 public schools with 67,697 pupils, and 205 private schools with 10,269 pupils; in Queensland, 1,023 public schools with 69,759 pupils, and 171 private schools, with an average daily attendance of 12,494. During the year 1903 the cost of administration and maintenance

Education

* Information not available.

of the State schools of Australasia was £2,530,618, while the revenue from fees, rents, sales of books, etc., amounted to £125,399, leaving a net cost to the State of £2,405,219, excluding a sum of £287,458 expended on school premises.

Great progress has been made in education. The following table affords a comparison of the number of literates and illiterates in every 10,000 of the population:

Degree of Education	Population over 5 years of age				
	1861	1871	1881	1891	1901
Read and write	7,001	7,038	8,270	8,804	9,099
Read only	1,380	1,186	689	303	229
Cannot read	1,619	1,776	1,041	803	672
Total	10,000	10,000	10,000	10,000	10,000

University education is provided at five universities, as seen in the following table:

University	Students attending lectures		
	Matriculated	Not matriculated	Total
Sydney	724	53	777
Melbourne	509	119	628
Adelaide	343	299	642
New Zealand	646	216	862
Tasmania	51	11	62
Total	2,273	698	2,971

Technical instruction is given in nearly all the capital cities of Australasia, as well as in many other parts of the country, and the question of extending the scope of the teaching in the various subjects is at present occupying the attention of the authorities in several of the states.

In the eyes of the State all religions are equal in Australasia, and State aid to the denominations has now been abolished in all the provinces of the group. South Australia, in 1851, was the first state to withdraw such aid, after it had been in force only three years.

Considerable outdoor relief is given in Australasia. The sum of indoor and outdoor relief, public and private, in 1903, in the seven colonies was £1,382,790. There are also many private charities, most of them being aided by the State. There were, 1902, 3,779 friendly societies, with 343,861 members. There are many ecclesiastical charities of the different denominations. In 1902 14,577 persons were cared for in destitute asylums. There were 349 hospitals in 1903.

One point in Australia is of special interest. It is said that "Australia is a continent without an orphanage, a country without an orphan. Each waif is taken to a receiving-house, where it is cared for until a country home is found. The local volunteer societies canvas their neighborhoods and send to the Children's Committee of the Destitute Board the names and circumstances of such families as they have found where children may be placed. The Children's Committee selects that home which it judges is best adapted to the development and care of the child in question. When of school age the child must be in school. The local volunteer committee looks after its care and culture. When the child is fourteen years old he begins to work. His earnings are placed in the postal savings-bank, and at seventeen or eighteen he goes into the world an independent man. The State, at an expense of less than $70 a year, has raised a man or woman to contribute to its wealth, and prevented the manufacture of a criminal, and the expense of courts, prisons, and reformatories."

The number of insane persons in Australasia under official cognizance in the various government hospitals for the treatment of the insane, at the end of 1902 was 15,673, equal to 3.36 per 1,000 of the population, or corresponding to one insane person in about every 300. This rate is below that prevailing in England, where one person in every 293 is officially known to be insane.

In Australasia 65.25 per cent of the male population and 19.88 per cent of the female are breadwinners. The number engaged in each class of occupation in 1901 was as given in table at bottom of page.

Thus 564,744 persons are engaged in the primary productive industries, agricultural, pastoral, and mining.

Gold-mining has played the most important part in Australian industry, having largely drawn her populations. Her gold product, too, doubled from 1890 to 1900, and almost equaled that of the United States and the Transvaal, her only rivals. In 1903 the exported gold was valued at £17,124,233. The gold produced in 1899 was £14,459,000. Other metals, however, are growing relatively important, the total mineral produced in 1899 being £22,201,000.

Industry

In wool-raising Australia leads the world, exporting in 1903 a value of £13,997,233. The wool crop has recently temporarily decreased, owing to drought, but scarcity has kept up its value.

Cattle-raising is also important, especially in Queensland, there being 9,838,000 cattle in 1899.

Manufacturing has, as yet, been comparatively little developed. High wages and a high protective tariff are the main features.

Agriculture is increasing, and Australia is becoming an important factor in the world's wheat product. (See Agriculture.)

The discovery of gold in 1851 divides the industrial history of Australia into two periods. Prior to 1851 Australia appeared to be destined for a purely pastoral country, but the discovery of gold effected a revolution in all industrial relations. The supply of labor in many occupations speedily became exhausted, and most branches of industry and all public works were at a standstill. The fever brought not only young, stalwart, enterprising men, but also multitudes whose chief idea was that wealth could be acquired almost without exertion. Unable to endure the hardships of the

	Professional	Domestic	Commercial	Transport	Industrial	Agricultural	Pastoral	Mining
Males	84,451	56,877	222,546	139,995	435,507	317,115	81,617	136,068
Females	50,195	178,563	40,042	3,914	91,880	26,792	3,115	37
Persons	134,646	235,440	262,588	143,909	527,387	343,907	84,732	136,105

digger's lot, the latter mostly drifted back to the chief towns; and there was speedily presented the spectacle of thousands of unemployed clamoring for government work, while the more stalwart laborers were earning extraordinary wages in the gold-fields. At the height of the gold discovery the earnings of miners in some cases were prodigious. Making allowance for illicit digging, in the first half of 1852, the average wage of all miners could hardly have been less than thirty shillings per day. From 1872 to 1893, however, the production of gold fell away, and gradually other industries were developed. The years 1892–95 were years of great disturbance, centering round the crisis of 1893. Since then conditions have improved and wages risen.

Wages

The movement in wages from 1896 to 1901 was distinctly upward. Carpenters, for example, were in 1896 paid 8*s.* per day in Sydney, while in 1900 their wages were 9*s.* 6*d.*, in 1901, 10*s.*, and in 1902, 9*s.* 6*d.* Tho wages in Melbourne at these periods were lower than in Sydney, their upward movement has been even greater, for in 1896 carpenters' wages in Melbourne ranged between 6*s.* and 7*s.* per day, the greater number being employed at the lower figures, while in 1900 the accepted rate was 8*s.* 3*d.*, in 1901, 10*s.*, and in 1902, 9*s.* As regards other trades connected with building, there has also been a marked improvement, and the rates of 1903 approach very closely those paid in 1891—that is to say, before the changes accompanying the financial crisis began to be felt. The following are the wages paid in 1903 in certain manufacturing industries:

Industry	Average weekly wages (£. s. d.)			
	New South Wales	Victoria	Queensland (Brisbane)	New Zealand
Males				
Cooperage	2 5 0	2 4 6	2 0 4	1 10 7
Sawmills	1 15 7	2 3 0	1 13 3	1 9 0
Wood-turning	1 16 11	.....	1 14 8	1 9 5
Agricultural implements	1 7 10	.....	.....	1 15 6
Brass and copper	1 9 8	1 9 8	1 9 4	1 12 0
Ironworks and foundries	1 18 3	1 15 7	.....	
Engineering	1 14 9	.....	1 16 0	1 13 0
Stoves and ovens	1 12 3	1 12 8	0 17 8	1 13 9
Tinsmithing, sheet ironworks	1 6 2	1 7 7	1 3 7	1 0
Tobacco, cigars	1 9 7	1 14 0	1 12 9	.....
Boots and shoes	1 12 9	1 15 1	1 7 6	1 13 4
Woolens	1 3 7	1 3 6	... ...	1 15 9
Females				
Confectionery	0 9 3	0 13 4	0 7 4	0 8 2
Jam and fruit canning	0 12 3	0 13 10	0 10 3	0 8 3
Tobacco, cigars, etc	0 16 6	1 1 1	0 15 8	.....
Woolen mills	0 12 11	0 17 8	.....	0 16 11
Boots and shoes	0 12 3	0 14 0	0 12 10	0 13 3
Clothing (tailoring)	1 1 8	.....	0 13 10	0 15 11
Dressmaking and millinery	0 10 5	0 11 9	0 10 0	0 10 3
Printing and bookbinding	0 11 0	0 13 2	0 11 6	0 12 7

These figures must be accepted with a certain degree of caution. In each state a considerable number of juvenile workers is employed, but only in Victoria is their actual strength ascertained, and as the average weekly wage paid in any establishment would depend to a large extent on the proportion of juvenile labor employed, a fair comparison is impossible while that information is lacking.

Considering the comparatively high rate of wages which prevails, food of all kinds is fairly cheap in Australasia, and articles of diet which in other countries are almost within the category of luxuries are largely used even by the poorer classes. The quantity of meat used by the Australasian people is the most remarkable feature of their diet. The consumption per inhabitant in Germany is 64 pounds, while in Australia it is nearly four times that quantity. In the United States, a meat-exporting country, the consumption is about two thirds of that of Australasia.

The expenditure of Australia coming under the designation "cost of living" amounted in 1903 to £42 19*s.* 1*d.* per head, made up of the following items:

Division of Expenditure	Total expenditure	Per inhabitant
		£ s. d.
Food and non-alcoholic beverages	£65,499,000	16 14 5
Fermented and spirituous liquors	14,217,000	3 12 7
Tobacco	3,365,000	0 17 2
Clothing and drapery	17,868,000	4 11 3
Furniture	2,075,000	0 10 7
Rent or value of dwellings	19,574,000	5 0 0
Locomotion	7,156 000	1 16 6
Fuel and light	5,416,000	1 7 8
Personal attendance, and lodging	7,032,000	1 15 11
Medical attendance and nursing	4,652,000	1 3 9
Religion, charities, education	3,075,000	0 15 8
Art and amusement	4,831,000	1 4 8
Books, newspapers, etc	1,804,000	0 9 3
Postage and telegrams	1,098,000	0 5 7
Direct taxes not falling on trade	1,706,000	0 8 9
Household expenses not included	5,447,000	1 7 10
Miscellaneous expenses	3,574,000	0 18 3
Total	£168,389,000	42 19 1

Tho Australasia has but the population of a province of some of the great European powers, in the wealth and earnings of its people it stands before most of the secondary states, and as regards wealth and income per head of population it compares favorably with any country. The following table shows the value of private property for the whole of Australasia, and the increase thereof at intervals of twenty-five, and in one instance fifteen, years:

Year	Value of Private Property
1788	Country first colonized
1813	£1,000,000
1838	26,000,000
1863	181,000,000
1888	1, 15,000,000
1903	1,204,042,000

For all Australasia, the value of land in private hands is £461,255,000.

The value of land and improvements together amounts to £836,770,000, or 69.5 per cent of the total value of property. The classification of the elements is as follows:

Classification	Commonwealth States	New Zealand
Land	£373,679,000	£ 87,576,000
Houses and improvements	310,265,000	65,250,000
Live stock	96,915,000	28,394,000
Household goods	30,899,000	5,661,000
Personal effects	12,464,000	2,498,000
Machinery, excluding mining	33,495,000	6,725,000
Shipping	6,359,000	1,944,000
Mining properties and plant	32,199,000	3,911,000
Merchandise on hand	59,640,000	14,015,000
Coin and bullion	26,064,000	5,189,000
Total	£981,979,000	£222,063,000

From 1880–84, for the Commonwealth the percentage of people possest of property at the time of death was 11.1. From 1890–94 it was 14.1, and from 1895–1900 it was 17.23. These figures show a distribution of property not to be paralleled in any other part of the world, but are not in sufficient detail to enable the question of distribution to be adequately discust. During the year 1903 the number of adults in the state was 735,589, and of these 190,617 were possessors of property, and 544,972 were without property. As regards the distribution among the 190,617 property owners, the following table throws much interesting light:

Categories	Number of persons with property	Proportion of total adults in each category per 10,000	Total value of property	Percentage of property belonging to persons in each category
£50,000 and over...	987	13	£130,521,100	35.4
25,000 to £50,000.	1,099	15	38,261,700	10.4
12,500 to 25,000.	2,397	33	41,125,900	11.2
5,000 to 12,500.	6,041	82	46,226,000	12.5
200 to 5,000.	120,798	1,648	107,315,600	29.1
Under £200.....	59,295	809	5,327,700	1.4
No property.....	544,972	7,400	.....	....
Total adults.....	735,589	10,000	£368,778,000	100

It would thus appear that 987 persons—that is to say, 0.13 (about one eighth of one) per cent—were possest of £130,521,000, or 35.4 per cent of the whole property of the community; 2,086 persons held £168,782,800, or 45.8 per cent of the total; and probably half the property of the state is in the hands of 3,000 persons. According to C. E. Russell (*Everybody's*, September, 1906), most of the troubles in Australia come from its land system. Crown land was originally given away to "the better classes" for a song. He says:

Diffusion of Wealth

In Victoria about a dozen families own one tract of 2,000,000 acres, chiefly used for sheep-runs and hunting grounds. For miles together are no inhabitants and no production except of primeval forest and native grass. Outside of this splendid domain settlers clamor for land; inside, the total population is insignificant and the use of the lands inconsiderable.

The last compilation of agricultural statistics by the government of Victoria makes this startling showing of conditions in that state:

Size of Holdings	Number of holdings	Total area	Area under cultivation
100,000 acres and more.....	8	2,448,433	8,209
50,000 acres to 100,000.....	15	983,948	5,835
20,000 acres to 50,000.....	121	3,549,351	13,953
10,000 acres to 20,000.....	180	2,583,802	20,905
5,000 acres to 10,000.	309	2,162,458	42,808

The fact that of nearly 2,500,000 acres held by eight persons only 8,000 acres produced anything, amounts to a demonstration that these things cannot continue. Yet these are typical conditions. In Queensland six families own 1,500,000 acres. One estate amounts to 250,000 acres. Ninety-two families hold 3,000,000 acres. Estates equivalent in size to a New England county were obtained in the old days, fifty years ago, for perhaps fifty cents an acre, and are now valued at $15 or $20 an acre, or even more; meantime, they lie as nature made them.

The total indebtedness of Australasia to British investors is set down at £407,290,000, and the annual return therefrom, excluding absentee incomes, £17,702,000. The capital sum represents a weight of £84 15*s.* 7*d.* per inhabitant, and the annual return £3 13*s.* 8*d.* The apparent interest earned is, therefore, over 4¼ per cent, a rate which must be considered very favorable, seeing that £250,415,000, or three fifths of the total, comprizes government and municipal securities. The Indebtedness of the states of the commonwealth to British creditors amounts to £343,938,000, or £86 16*s.* 3*d.* per inhabitant, of which £188,345,000 is due by the central governments, and £8,221,000 by local bodies, while £147,372,000 represents private investments. The indebtedness of New Zealand is £63,352,000, or £75 4*s.* 5*d.* per inhabitant, of which £48,049,000 is owing by the central government of the colony, £5,800,000 by local bodies, and £9,503,000 represents private investments.

The external trade of Australia is larger than that of any British possession, India alone excepted.

Year	Imports	Exports	Value per inhabitant
			£ *s.* *d.*
1861.....	£17,562,960	£17,399,656	30 5 10
1871.....	16,715,442	21,225,797	22 14 10
1881.....	29 031,131	27,528,583	24 16 0
1891.....	37,711,053	36,052,145	22 19 1
1901.....	42,433,811	49,696,172	24 4 3
1904.....	37,920,242	57,489,216	24 1 3

These figures would be still larger if proper records had been kept.

The chief exports are: From New South Wales: wool, silver, gold, coal, and hides (there are 30,000,000 sheep in the colony); from Queensland: gold, wool, frozen meat, hides, and sugar; from Victoria: gold wool, wheat, and butter; from South Australia: wool, wheat, and copper; from West Australia: gold, wool, pearl, and timber; and from Tasmania, gold.

Commerce

Customs duties through the commonwealth are uniform. The trade of the commonwealth with the more important countries was (1903): Exports to United Kingdom, £19,962,503 (mainly wool); India, £5,601,972; Ceylon, £3,973,799; France, £3,216,526; Germany, £3,134,683; United States, £2,625,399 (mainly wool). Imports from United Kingdom, £19,855,340 (mainly cottons and iron work); United States, £6,368,532 (mainly wheat and machinery); Germany, £2,358,533; New Zealand, £2,301,792.

One third of all goods now imported into Australia may be said to be of non-British origin as compared with one fourth ten years ago. The chief factor in bringing about this change is undoubtedly the establishment of direct and rapid communication between Germany, France, Belgium, Japan, the United States, and the Commonwealth. The German and French governments subsidize lines to Australia.

The imports from the United States amounted, in 1903, to £6,368,532, or nearly half the total imports from all foreign countries. Next in order comes Germany with £2,358,553, followed by the Netherlands and Java with £847,387, and France with £506,667. The chief imports from the United States are boots and shoes, barley, wheat, flour, agricultural implements, leather, machinery, metal manufactures, kerosene, printing paper, tobacco, tools, vehicles, and timber. The chief

imports from Germany comprize wearing apparel, dynamite, candles, fancy goods, pianos, machinery, metal manufactures, piece goods, and manures.

II.—Constitution and Government

New South Wales, Queensland, South Australia, Tasmania, West Australia, and Victoria formed, Jan. 1, 1901, the federal commonwealth of Australia. Power (largely nominal) is vested in the king, represented by a governor-general, and in a Senate and House of Representatives. The present governor-general is Lord Northcote. The Senate consists of 36 members, 6 from each original state, chosen by direct vote of the people. The House has 75 members, chosen for three years by direct vote. New South Wales has 26 members, Victoria 23, Queensland 9, South Australia 7, Western Australia 5, Tasmania 5. The governor-general may assent or withhold assent to any law, or return it with recommended amendments, or reserve it two years for the king's pleasure. State governors are still appointed by the crown, and State Parliaments legislate on matters not transferred to the Federal Parliament. There can be no State religion. Trade between the states must be absolutely free. The executive of the commonwealth is the governor-general, with a council of seven ministers. The Hon. Alfred Deakin is minister.

In the first election (1901) the first cabinet, formed by Sir Edward Barton, had a majority of both houses, tho the Labor Party secured 36 seats in the House and 8 in the Senate. Mr. G. H. Reid led the opposition, and Mr. Watson the Labor Party. The second general election (1903) returned to the Senate 8 Conservatives, 14 Liberals, 14 Laborites, and to the House 26 Liberals, 26 Conservatives, and 23 Labor members. In April, 1904, Mr. Watson formed a Labor ministry, having, with the aid of the Liberals, defeated Mr. Deakin's Government (Conservative). In August, 1904, however, he was defeated on a bill favoring trades-unionists over non-unionists, and Mr. Reid formed a Liberal ministry. July 5, 1905, he was defeated, largely on account of his denouncing the "White Australia" policy, and Mr. Deakin returned to office. There are now 23 Laborites in the House out of a total membership of 75. In the separate Australian legislatures there are many more Labor representatives: 34 in Queensland, 25 in New South Wales, 22 in Western Australia, 18 in Victoria, 6 in South Australia, and 7 in Tasmania. The Australian Labor Party is not avowedly a Socialist Party, nor are all its members Socialists, but its platform is virtually socialistic, both in its immediate proposals and in its tendencies.

State socialism is well known to have played a large part in Australia, and the railroads and most public services are owned and conducted by the government. Hence Australia is sometimes called a socialistic commonwealth. But the fact is that it is quite as true to say that there is no socialism in Australia as that there is much. Either statement is inexact. There is a great deal of State socialism, conducted mainly by a capitalistic government, and considerable democratic socialistic sentiment, but little more.

The State ownership of railroads in Australia may be said to have even tended to temporarily check the advance of real socialism; for investors, unable to invest or to speculate in railroads, have gone the more extensively into land speculation. Land booms have been universal. As they began to fail, capital poured in from England to keep them up and to defer, tho only finally to intensify, the inevitable collapse. Capital, too, unable to obtain sufficient interest in ordinary production, has been put into banks to obtain 5 per cent, compelling the banks to invest in all they could that promised more than 5 per cent. Hence banks bought land, conducted farms, stores, anything that promised dividends. When the bubble finally burst the banks collapsed, the whole community suffered, and Australia, with the rest of the world, has had to struggle with the unemployed. The policy of the government in opening railroads before they could be made profitable, in order to develop the land, has meant large State debts, and often deficits, tho it probably means eventual profit. Conservatives, therefore, have taken advantage of this, and often declare government ownership in Australia a financial failure. For example, Mr. Charles Fairfield wrote, in "A Plea for Liberty" (1891):

Government Ownership

> Experiments in cryptosocialism, tried upon a society at base free, commercial, modern, English, would long ago have broken down on the financial side, had it not been that the legendary repute of those lands for natural wealth, such as gold, wool, a fruitful soil, and a fine climate, has tempted investors in Europe to fling their money at the heads of Australasian borrowers. Latterly, as the frightful cost and necessarily unproductive results of State socialism became apparent to colonial ministers, they have, to prevent a collapse of the whole thing, been driven to apply for ever-recurring loans in Europe on false pretenses. . . . The truth is, that nothing definite can be known about the finances of the Australasian colonies.
>
> State socialism there dares not present a genuine balance sheet. No attempt has been made to introduce the imperial system of simple, methodical, and exact account keeping.
>
> Meanwhile, for years past reports of imaginary surpluses, as well as misleading and worthless "official" statistics have been circulated in the Australasian colonies, and have been carelessly reproduced here. The statement is constantly put forward, for example, that the Victorian State railways, which are supposed to represent an expenditure on productive public works of the bulk of the money borrowed by that colony since 1865, honestly earn a surplus in excess of the interest on their cost. That statement is not and never has been true.

On the other hand, Sir Charles Dilke, in his "Problems of Greater Britain," says:

> The railways are used for the spread of education, and in New South Wales and some other colonies the school children are carried free of charge. In Victoria remissions of fares are made in the case of students in the schools of mines and in the schools of design. Specially low rates exist in all the colonies for suburban traffic. The fares in the neighborhood of Melbourne, for a district nearly thirty miles across, are, for single journeys, 1*d.* a mile, first-class, and ½*d.* a mile second class; and return tickets are given at ¾*d.* a mile, first class, and ½*d.* a mile, second class; while monthly, quarterly, half-yearly, and yearly tickets are granted at great reductions even upon these low rates. The result is a wonderful spread of suburban railroad traveling, and the custom in Victoria is so developed that out of the large number of persons working in Melbourne who come in by train every day, a considerable proportion come to the town a second time in the evening to visit the theaters. The lowness of railway fares in Victoria is the more striking when we remember that wages are twice as high for shorter hours as they are in England, and that coal costs nearly twice as much. No one in Victoria now advocates private ownership of railways (p. 198).
>
> Not only have the State railways of Victoria been placed under non-political management, but this has been the case with the public departments generally (p. 199).
>
> The principle of government cooperation with localities has been carried into a large number of different fields in the colony of Victoria; tramways, for example, are constructed by municipalities on government loans, the State borrowing money for the municipalities on the best terms which the colony can command in the market, but the municipalities ultimately becoming the owners of the lines (p. 203).

In 1904 Mr. T. A. Coghlan, editor of the *Statistical Account of Australia and New Zealand*,

and universally regarded as the best authority, wrote:

To the proper development of a country like Australasia, ill supplied with navigable rivers, railway construction is absolutely essential. This has been recognized from an early period, and for the last forty years the governments of the principal states have been fully alive to the importance of carrying on the work. For a long time, however, they were hampered in their efforts by the difficulty of borrowing money in London at a reasonable rate of interest; but since the year 1871 considerable progress has been made in the work of construction; indeed, by far the greater portion of the public debt of Australasia has been contracted for railway purposes. As the area of the six states and New Zealand almost equals that of Europe or the United States of America, while the population numbers a little over 4,500,000, it is almost needless to say that many of the lines run through districts very sparsely peopled. This is particularly the case in the states of Queensland, South Australia, and Western Australia, where there are vast tracts of territory in which little in the nature of permanent settlement has yet been accomplished, and in none of the states can it be said that the railway lines traverse thickly settled areas. Indeed, if a fault may be found with the State policy pursued in the past, it is that in some cases expensive lines have been laid down in empty country the requirements of which could have been effectually met for many years to come by light and cheap lines, and that in consequence the railway administrators find themselves heavily burdened with a number of unprofitable lines. A few of these have been closed, and the remainder are worked at a loss. Notwithstanding these drawbacks, however, the railways of the commonwealth of Australia collectively yield a net return equal to 3.08 per cent, and those of Australasia 3.15 per cent on the cost of construction.

The facts in regard to the railways are as follows: In New South Wales, the first railways were projected as far back as 1846, and a few years afterward a company—the Sydney Tram and Railways Company—was formed. The company undertook the construction of a line from Sydney to Parramatta, a distance of fourteen miles; but as the capital became absorbed before the work was completed the company was unable to carry on operations, and in the end the government had to take the line, which was finished on Sept. 26, 1855.

The following table shows the extent of railway mileage in each state since 1861:

State	1861	1871	1881	1891–2	1903–4
New South Wales....	73	358	1,040	2,266	3,362
Victoria.....	114	276	1,247	2,903	3,381
Queensland.....	*	218	800	2,320	3,030
South Australia.....	56	133	845	1,823	1,901
Western Australia...	*	*	92	657	2,170
Tasmania.....	*	45	168	425	620
Commonwealth...	243	1,030	4,192	10,394	14,464
New Zealand.....	*	105	1,334	2,011	2,412
Australasia.....	243	1,135	5,526	12,405	16,876

* Railways not in existence.

At the close of the year 1903–4 the cost of construction and equipment of the State railways completed and open to traffic in the commonwealth was, in round figures, £131,930,000, or 57.96 per cent of the public debts of the states comprized in the federation, after deducting sinking-funds. The construction and equipment of the railways of Australasia cost £152,623,700, or 53.52 per cent of the public debt of Australasia, after deducting sinking-funds. The proportion of gross earnings absorbed by working expenses recently has been as follows:

State	Percentage of gross earnings absorbed by working expenses				
	1899–1900	1900–1	1901–2	1902–3	1903–4
New South Wales...	55.93	57.17	61.80	68.37	65.74
Victoria.....	62.89	62.17	64.31	66.69	58.82
Queensland.....	64.78	80.34	71.82	69.95	62.19
South Australia.....	56.37	58.95	63.54	58.01	58.19
Northern Territory..	164.47	182.59	276.70	113.40	77.73
Western Australia...	68.40	77.19	82.58	80.33	74.28
Tasmania[1].....	79.10	79.07	84.26	74.31	67.16
Commonwealth...	61.46	64.66	67.41	68.96	63.68
New Zealand[2].....	64.80	65.30	66.80	68.05	65.98
Australasia	61.94	64.75	67.33	68.73	64.05

[1] Years ended Dec. 31, 1899–1903.
[2] Years ended March 31, 1900–4.

Of 1905, Consul-General Bray says ("U. S. Consular Reports," November, 1905): "The gross revenue of the Australian Government roads the year ending June 30, 1905, was $56,436,837, with net earnings of $22,745,508."

Post and Telegraph

In Australia post, telegraph, and telephone are in the hands of the State. The first post-office was established in 1810, and in 1831 a twopenny post was introduced. In 1903 there were 6,501 post-offices in the commonwealth, conveying 12,844,300 letters or cards, 99,580,261 papers, and 44,314,366 packets. Excepting Western Australia, where there was no inland service, there were inland, intercolonial, and international parcels posts in operation in 1903; but statistics of the services on a uniform basis are not obtainable. In all the states there are money-order and postal-note systems in operation; and in all the states, except Victoria, Queensland, and South Australia, post-office savings-banks. In Queensland there is a government savings-bank, but it is not placed under the administration of the postmaster-general. The savings-banks, however, not administered by the government, are under trustees or commissioners usually nominated by the government. Returns of savings-banks show an enormous increase.

In 1861 the number of persons who had accounts in the savings-banks represented only 2.31 per cent of the entire population of Australasia; but in 1871 the percentage had risen to 5.98; in 1881, to 11.33; in 1891, to 19.47; in 1900–1, to 25.52 per cent; in 1902–3 the proportion was 27.69 per cent; while in 1903–4 it was 28.41 per cent. In 1903–4 the number of depositors were 1,352,853, with deposits amounting to £42,613,014, or an average sum of £31 9*s.* 10*d.*

In no other country in the world has the development of telegraphic communication been so rapid as in Australasia, and in none has it been taken advantage of by the public to anything like the same extent. Taking Australasia as a whole, there are only four countries that possess a greater extent of telegraph lines, and only seven in which a larger number of messages is actually sent. In no other countries, however, except the United Kingdom and Belgium, do the number of messages bear anything approaching the same ratio to the population. In Australasia, in one year, over three messages were sent over the telegraph for each inhabitant. In the United Kingdom the number was nearly two and one fifth for each inhabitant; and in the United States of America about one message to every inhabitant. The return for the United States, however, includes only the lines of the Western Union Company. In the whole of Australasia there were on Dec. 31, 1903, 4,282 telegraph stations, of which 987 were in New South Wales, 878 in Victoria, 481 in Queensland, 290 in South Australia, 172 in Western Australia, 321 in Tasmania, and 1,153 in New Zealand. There were 52,919 miles of telegraphic lines in 1903, and 14,673,452 messages were sent.

In connection with the telegraph departments of the various states, telephone exchanges have been established in the capitals and other important centers of population. In the Australasian states the rates for telephones at places of business range from £5 to £10 for the maximum length of wire—generally one mile, the colonies with a half-mile radius being New Zealand and Queensland—and the charge is higher in the city than in the

country. The following table shows the revenue and expenditure of the postal and telegraph departments of the states during 1903:

State	Revenue				Expenditure
	Posts	Telegraphs	Telephones	Total	
New South Wales	£652,761	£154,839	£105,002	£912,602	£884,963
Victoria	448,486	106,839	86,600	641,925	582,520
Queensland	191,931	83,266	27,321	302,518	425,568
South Australia	166,400	74,840	23,209	264,449	240,987
Western Australia	122,862	68,137	30,324	221,323	277,021
Tasmania	75,412	17,289	8,910	101,611	100,232
Commonwealth	1,657,852	505,210	281,366	2,444,428	2,511,291
New Zealand	343,207	166,536	71,028	580,771	526,747
Australasia	2,001,059	671,746	352,394	3,025,199	3,038,038

In the expenditure shown in the table, interest on the outlay on post-office buildings and telegraph lines and maintenance of buildings is not taken into account. If allowance be made for these, so far as is possible from the very imperfect returns concerning the expenditure on post-offices in each state, the total expenditure and the deficiency in revenue would be as follows:

State	Departmental expenditure	Interest and maintenance of works and buildings	Total charge	Deficiency in revenue
Commonwealth	2,511,291	380,995	2,892,286	447,858
New Zealand	526,747	78,535	605,282	24,511
Australasia	3,038,038	459,530	3,497,568	472,369

With the progress of settlement and the increase of population, the expenditure on the postal and telegraphic services naturally expands, and it is apparent that in order to keep pace with the expenditure, the services must be conducted on a self-supporting basis. This, it is believed, can be reached with growth of population and consolidation.

III.—Social Reform

Social reform in Australasia may be said to have begun with the first formal recognition of the eight-hour day by the New Zealand Company in the settlement of Otago, under the influence of the Rev. Thomas Burns. Its spread through Australia is largely due to the Victorian Operative Stonemasons' Society, who set the movement on foot in Melbourne in February, 1856.

Eight-Hour Day

An eight-hour league was formed of united trades, and notice given that after April 21, 1856, no union man would work more than eight hours. The strength of the artizans' position in the labor market enabled them to win, and April 22d has been kept ever since as a public holiday, known as the Eight-Hour Day. The eight-hour day has come to be regarded as normal throughout Australasia. Nevertheless, it is fully realized only by the stronger unions and skilled trades. Gained at first without legislation, it has been found that legislation is needed to secure and maintain it.

In 1873 Victoria enacted a law limiting the employment of women and children to eight hours, and New Zealand almost immediately did the same. Other colonies have been much more slow in action. In 1885 a Victorian law (amended in 1896) fixed the closing of shops, except for certain trades, at seven P.M. five evenings in the week, and at ten on Saturday nights. New Zealand acted somewhat similarly in 1894, and closed all shops (with a few exceptions) for one afternoon. Other colonies have followed later. Victoria in 1896 created a Minimum Wage Board, which can fix minimum wages, hours, and the number of apprentices in such trades as Parliament determines. Western Australia and New South Wales have adopted compulsory arbitration laws mainly as in New Zealand.

Trade-unionism has played a prominent part in Australia, but with few features of especial interest. As early as 1850 a branch of the Amalgamated Society of Engineers was established in Australia, and since that date almost every industry has formed its own organization. Strikes have not been very frequent nor of very great importance till we come to the great strikes of 1890 and 1891, which mark an epoch in the development of the Australian labor movement. The membership of the trade-unions on Jan. 1, 1904, was:

Trade-Unionism

New South Wales	70,622
Victoria	7,942
Queensland	4,681
South Australia	7,300
West Australia	10,047
Tasmania	34
Commonwealth	100,626
New Zealand	25,354
Australasia	125,980

There are, however, perhaps twice that number more or less affiliated with the trade-unions. Their history is bound up with the great strike of 1890, which originated in an effort of the Shearers' Union to allow only union shearers to be employed. The wharf laborers struck to support them.

Difficulties had also arisen in the shipping trade, quite apart from the shearers' dispute, owing to the discharge of a fireman. Great discontent also existed among the marine officers, on account of lack of accommodation on board ship. Conference was declined by the employers, it being alleged that meeting on equal terms with their subordinates would destroy discipline on board ship.

In August, therefore, the marine officers struck, the wharf laborers came out a few days later, followed by the seamen and draymen, the Newcastle miners were locked out for refusing to hew coal which they believed to be intended for employers engaged in the strike, and in September the shearers were ordered to join the others. The strike spread from Victoria to New South Wales, Queensland, and New Zealand, and there was a general cessation of trade. The unionists were successful in stopping almost all the steamer traffic, and agriculturists were prevented from disposing of their produce. Food became very dear in consequence, and butter rose to as much as 2s. 0d. a pound. Some disorder developed but was put down, and the striking unions gradually found themselves losing.

The Great Strike

In Queensland the strike was less serious than in Victoria and New South Wales, because the Queensland Labor Federation ordered the execution of all existing contracts, and the shearers returned to work after being out only one week. By October the strike was practically at an end throughout the colonies.

In 1891 the shearing difficulty was renewed in Queensland and New South Wales, and a strike of much longer duration took place. "Obstacles were placed in the way of trains, bridges were weakened, armed mobs of men traveled about the

country burning and destroying the property of the pastoralists." Armed resistance to the government was advocated as preliminary to a general revolution throughout Australasia, and attempts were made to bring the railway servants and even the military over to the side of the strikers. Throughout March, April, May, and June arrests were frequent. Meanwhile shearing was carried on by means of free labor, and since the strike could not accomplish its objects and funds were exhausted, it was declared off on June 15th.

But it was the failure of these strikes which created the Australian Labor Party. Finding themselves defeated in the strikes, the men turned to politics. In some cases the victorious employers suddenly found themselves defeated in elections and their places taken by the very trade-unions' leaders they had defeated. Even strike leaders who had been sent to jail were nominated for Parliament.

Previously there had been a few working men elected as trade-unionists, but none on a distinctively Labor platform. A great impetus was given to the movement by the vivid speeches of the radical, "the great Pro-Consul," George Grey, ex-Governor of New Zealand, South Australia, and South Africa. With little organization and less money, 36 Labor candidates were elected (1891) in New South Wales. Since then the movement has grown throughout Australasia. South Australia was, however, the first state to form a direct Labor Party. In the Australian Federal Parliament there were in 1904 (second House) 23 Labor men in a house of 75. But they hold the balance of power. Free-traders and protectionists (formerly the main political issue in Australia) are so equal in numbers that the Labor men, by uniting with one party, can at any time defeat the other. Hence the continual changes and the Labor men themselves being given the government for five months (see above). The present ministry only holds by passing most of the bills the Labor Party demands. Hence largely the progress in legislation of Australia, covering Industrial Arbitration, Miners' Accident Relief, Coal Mines Regulation, Early Closing, Navigation Act Amendment, Land Tax, Old Age Pensions, Women's Franchise, Electoral and Trucks Acts, etc.

Labor Parties

At the third Interstate Labor Conference, held in Melbourne, July, 1905, the following objective was adopted:

(*a*) The cultivation of an Australian sentiment, based upon the maintenance of racial purity and the development in Australia of an enlightened and self-reliant community.

(*b*) The securing of the full results of their industry to all producers by the collective ownership of monopolies and the extension of the industrial and economic functions of the state and municipality.

The question of the tariff also received a large amount of attention—some delegates being favorable to making the advocacy of a high protectionist policy a *sine qua non* for labor candidates, but the majority held the view that to introduce the fiscal issue would be to split the ranks, and it was eventually decided to place a Tariff Referendum as a plank in the platform. "A progressive tax on land values" was also added to the platform.

The conference also carried a resolution against any alliance, coalition, or combination being entered into by Labor representatives in Parliament without the consent of the combined labor organizations. It was also decided in the event of labor governments coming into power, that the ministries should be recommended by the caucus.

It will thus be seen that the Labor Party is practically, tho not avowedly, a Collectivist or Socialist party; and an increasing section of the labor ranks advocate straight-out socialism. There is a strong agitation for a reduction of members in the upper houses, if not for the abolition of this branch of the legislature, in view of the fact that Australia has now fourteen houses of Parliament. The establishment of boards to regulate wages and conditions of workers and arbitration courts, and a movement to break up the large estates and throw the lands open to the mass of the people, constitute the most burning questions of the day in all parts of the commonwealth.

The Single Tax idea has some hold in Australia, owing to the land concentration, particularly in South Australia; and the movement was much helped by a visit from Henry George in 1890. In New South Wales a land tax is levied on the unimproved value; the present rate being one penny in the pound. An exemption of £240 is allowed, and if the unimproved value is in excess of this sum a deduction equal to the exemption is made, but when a person or company holds several blocks of land only one sum of £240 may be deducted from the aggregate unimproved value. The number of persons owning land in New South Wales is about 178,000, but the deductions allowed by law reduced the actual number of taxpayers to 41,000.

Taxation

The Land Tax Act in force in Victoria was passed with the object of breaking up large holdings. For this purpose it was declared that all "landed estates" should be subject to taxation; that a "landed estate" should consist of one or more blocks of land not more than five miles apart which possest an aggregate area of 640 acres and a capital value of more than £2,500; and that the value in excess of £2,500 should be taxed at the rate of 1¼ per cent per annum. In South Australia the land tax is calculated on the unimproved value, the rate being one halfpenny in the pound sterling, with an additional tax of one halfpenny on every pound in excess of £5,000. The amount of tax payable by an absentee, who is defined as a person who has been absent from or resident out of the state for twelve months, is increased by 20 per cent.

The land tax payable in Tasmania is at the rate of one halfpenny in the pound, where the assessed value is under £5,000; five eighths of a penny, where the assessed value is £5,000 and under £15,000; three quarters of a penny, where the value is £15,000 and under £40,000; seven eighths of a penny where the value is £40,000 and under £80,000; and one penny where the value is over £20,000.

Income taxes are also levied in all the states; In Victoria, e. g., the rate of income tax payable in the state varies according to the source whence the income is derived and the taxable amount of such income. On incomes derived from personal exertion, threepence in the pound is payable up to £300; on every pound in excess of £300 up to £800, fourpence; on every pound in excess of £800 up to £1,300, fivepence; on every pound in excess of £1,300 up to £1,800, sixpence; and on every pound in excess of £1,800, sevenpence; double these rates being payable on incomes the produce of property within the state. All incomes, except those of companies, of and under £150 escape taxation.

Such legislation is not revolutionary; yet it is this which has largely raised hostility to the Labor Party on the part of conservatives, making some of the latter class in Australia declare that the commonwealth is being ruined. Financial and economic returns, however, do not justify this criticism.

Political reforms have also had considerable

development in Australia. (See AUSTRALIAN BALLOT SYSTEM; also, for the Australian system of land registration, see TORRENS.) There has been considerable agitation in Australia for proportional representation and for direct legislation, but as yet with slight results. Currency reform has its various advocates in Australia, and especially bimetalists and others who declare that the great southern continent, like the rest of the world, has suffered from the appreciation of gold. Yet little of importance has been accomplished in the way of reform. For good or for evil, Australian finance is still ruled by English gold.

Political Reform

The woman's suffrage movement has gone further.

There are in Australia three distinct classes of suffrage, municipal, parliamentary, and federal. Women were given municipal suffrage in New South Wales in 1867; in Victoria, 1869; in West Australia, 1871; in New Zealand, 1877; in South Australia, 1880; in Tasmania, 1884. Parliamentary suffrage was extended to women of New Zealand in 1893; in South Australia, 1895; in West Australia, 1900; in New South Wales, 1902; in Tasmania, 1903; in Queensland, 1905. In 1902, the first federal Parliament extended the federal suffrage to all women in Australia upon the same terms as men. All women in Australia, therefore, upon the same terms as men, enjoy full municipal and federal suffrage, and the women of West Australia, South Australia, and New South Wales possess all forms of suffrage.

One problem that has vexed Australia considerably is that of the immigration and importation of cheap labor. The importation of Chinese labor was long more or less common to all Australia. According to the latest returns, there were 30,542 full-blooded Chinese in the commonwealth, and 24,000 other colored aliens. The immigration of the Chinese, however, has, after an intense excitement, been carefully restricted in all Australia. Kanaka labor has been another "burning question." Particularly has the introduction of Kanaka labor been a source of grievance to the trade-unions of Queensland. The Kanakas have been introduced mainly to work on the sugar plantations. The claim has been that white labor was unsuited to this work in this climate, while it was a good thing for the Kanakas, they going back to their Pacific island to carry home the benefits of civilization. On the other hand, the trade-unionists have asserted that this was simply an excuse to get cheap labor, and that the Kanaka trade was simply a disguised slave trade, done in ships little better than the old slave-traders and accompanied by most of the evils of that trade. The Kanakas were inveigled on board, often by "fire-water." Once there they were supposed to sign a document that bound them to labor for a term of years in the sugar fields. As none of them could read or write or understand the document they signed, this meant little. One hundred dollars a head the planter was wont to pay the "recruiter" for catching Kanakas and landing them in Queensland—rather less than African slavers' rates in the good old days, but the distance was less and the danger nothing, because the British Government protected this traffic. Finally, however, mainly from the agitation of the trade-unions and the Labor Party, aided in part by the British and Foreign Anti-Slavery Society, after a struggle of twenty years, Kanaka labor has become practically ended.

Kanaka Labor

The question of granting pensions to aged persons has been of late years much discust throughout Australia and New Zealand, and at the present time the old-age pension system is in operation in New South Wales, Victoria, and NEW ZEALAND. (See also OLD AGE PENSIONS.) The settlement of population on the land also has enlisted considerable attention. Large estates are being bought up and divided into allotments, which are sold to purchasers on easy terms, extending over many years. (See NEW ZEALAND.) Labor colonies for the unemployed are being agitated.

Important Australian societies are:

Imperial Federation League. President, Hon. Alfred Deakin, Llanarth, Walsh Street, South Yarra, Melbourne, Victoria.

Federal Council of Australian Labor Unions. Hon. Secretary Robert Storrie Guthrie, Knighton Villa, Peterhead, South Australia.

National Anti-Sweating League. Hon. Secretary, Samuel Mauger, M.P., 66 Bourke Street, Melbourne, Victoria.

Federal Single Tax League of Australia. President, Max Hirsch, 416 Collins Street, Melbourne, Victoria.

Peace Society (Australian Branch of the London Society). Chairman, Dr. Charles Strong, Avoca Street, South Yarra, Melbourne, Victoria.

Peace, Humanity, and Arbitration Society. President, Rev. Dr. Rentoul, St. Oswald's, Ormond College, Melbourne, Victoria.

Melbourne Socialist Society. President, H. H. Champion, Commonwealth Rooms, 117 Elizabeth Street, Melbourne, Victoria.

Christian Social Union. Adelaide Secretary, Rev. C. E. Doudney, Jeffcott Street. Melbourne Secretary, Rev. R. Stephen, Trinity College. Sydney Secretary, Rev. S. S. Tovey, St. John's, Bishopsthorpe Glebe.

Australian Woman's National League. President, Lady Janet Clarke Cliveden, East Melbourne, Victoria.

Woman's National Council (affiliated with the London International Council).

Effective Voting League of South Australia. President, Catherine Helen Spence, Aviland Avenue, N. Norwood, Adelaide, South Australia.

Salvation Army in Australasia. Chief Secretary, Col. W. T. Hoskin, 67 Bourke Street, Melbourne, Victoria.

AUSTRALIAN BALLOT: A ballot the distinctive feature of which is that it contains the names of all the candidates, so that the voter is given but one single ballot to take with him into the polling-booth; and by making his cross on this one sheet against the names or emblem of the party for which he wishes to vote, he may indicate his choice and fold up and cast his ballot without any one knowing which way he has voted. It is called the Australian ballot because first used in Australia, having been first proposed by Francis S. Dutton of the legislature of South Australia in 1851, and adopted in that state and in the various other states of the Australian commonwealth during the "fifties" of the nineteenth century. In slightly different forms it was adopted in England in 1872, and in various English colonies. In 1882 it was advocated in the United States by Henry George, and first adopted by Massachusetts in 1888, and about the same time by the city of Louisville, Ky. In the original system the names of all the candidates are printed in alpha-

betical order, so as to compel the voter to make individual choice; but in many of the states of the American Union each party is allowed to have on the ballot a party symbol, so that by making one cross against this the voter may indicate his desire to vote the "straight ticket" of that party.

AUSTRIA-HUNGARY: In the following article are considered all matters pertaining to Austria, as well as such conditions as are common to both Austria and Hungary. All questions specifically affecting HUNGARY are treated under that heading.

I.—Statistics

AREA AND POPULATION

CROWN LANDS	Area, square miles	Population, 1900	Per square mile
Lower Austria	7,654	3,086,382	405
Upper Austria	4,631	809,918	175
Salzburg	2,767	193,247	69
Styria	8,670	1,356,058	156
Carinthia	4,005	367,344	91
Carniola	3,856	508,348	132
Coast Districts	3,084	755,183	245
Tyrol	11,324	979,878	86
Bohemia	20,000	6,318,280	315
Moravia	8,583	2,435,081	284
Silesia	1,987	680,529	342
Galicia	30,307	7,295,538	241
Bukowina	4,035	729,921	181
Dalmatia	4,940	591,597	120
Hungary and Transylvania	108,258	16,768,143	153
Croatia and Slavonia	16,773	2,397,249	146
Fiume	8	38,139	...
Total	240,942	45,311,651	188

General Statistics

Austria proper has 115,903 sq. m. and a population of 26,000,000. Of this number about 9,000,000 are Germans, 6,000,000 Bohemians and Moravians, 4,250,000 Poles, 3,380,570 Ruthenians, and 1,200,000 Slovaks. The principal cities are Vienna, with a population of 1,674,957 (1900); Prague, 201,589; Lemberg, 159,877; Gratz, 138,080; Triest, 134,143; Brünn, 109,346. The birth-rate in 1901 was 36.9; death-rate, 24. (See BIRTH- AND DEATH-RATE.) The illegitimate births (1897–1901) were 14.20 per cent, the highest ratio in the world, tho they varied from 41 per cent (1900) in Carinthia to 4.2 per cent in Dalmatia. Marriages in 1900 were 8.1 per 1,000 of population. (See MARRIAGE.)

In 1900, 79 per cent of the population were Roman Catholic, 12 per cent Greek Catholic, 2.3 per cent Greek Oriental, 4.7 per cent Jewish, 2 per cent Evangelical. Religious liberty is secure. There were (1900) 16,939 Roman Catholic priests; 7,860 members of male orders, and 19,194 of female. Education is on the increase, yet 31 per cent of the population above twelve years of age were (1900) unable to read and write. In 1890, however, it was 79 per cent. (See ILLITERACY.) In 1900 there were 16,211,272 who could read and write (an increase since 1880 of over 5,000,000), and 9,186,362 who could neither read nor write (a decrease since 1880 of nearly 700,000). Elementary schools (1902), 20,827, with 3,742,486 pupils and 96 training colleges. Gymnasia and real-schools (preparatory for universities or technical schools), 328, with 105,585 pupils. There were also 8 state universities, 49 theological colleges (45 Roman Catholic), 8 government technical schools, besides 4,230 special schools (agricultural, industrial, etc.). In 1904, 3,320 periodicals were published, of which 3,039 were in German, 172 being dailies. The *Neues Wiener Tagblatt* has the largest circulation.

Convictions for crime in 1903 numbered 33,940; for other misdemeanors, 581,254. There were 15 penal establishments, with 8,266 male prisoners and 1,069 female. (See CRIME.)

About 2 per cent of the population receive aid. There were in 1902, 1,643 poorhouses, with 37,808 inmates. The expenditures for these was 8,301,652 kronen. Institutions for relief vary greatly throughout the empire. They were formerly mainly in the care of the Church, but now tend to be transferred to civil officers. No one can claim relief for whom any third party is legally responsible. Recipients are bound to return the aid when they can. Aid must be limited to that which is necessary for existence, for the care of the sick, and for needy children. It is usually given in cash. Overseers or visitors (*Armenpfleger*) are not found everywhere, wherefore "Certificates of Poverty" are required, which are often misused. In Lower Austria the overseers of the poor usually serve without compensation. In Upper Austria the commissions for the poor are made up of the chief executive of the borough, a priest, and at least three overseers (*Armenväter*). In Vienna there are nineteen districts, each with a district committee, which elects a board of commissioners. There are also a general poor department and another department for orphans. There are many institutions which are partly private, but that are endowed with public funds. In 1899 there were in Vienna 951 endowments, with a capital of 6,140,939 gulden.

There are many Church institutions: Catholic or Protestant, several being connected with certain knightly orders. Charity organization is backward. The municipal Houses of Maintenance are better organized. The Vienna foundling asylum is the largest in the world. There were in 1902, 1,387 crèches, kindergartens, etc., and 220 orphanages. There are over 600 hospitals (16 for children).

There were in 1903, 585 savings-banks, with 3,464,715 depositors, and deposits amounting to 4,368,550,000 kronen.

Industry

The principal occupation is agriculture. Of the bread-earners 64.3 per cent are engaged in agriculture or fishing, 21.9 per cent in manufacturing or mining, and 6.4 per cent in trade and commerce; 63.2 per cent of the men are bread-earners, and 47.3 per cent of the women. The main crops are wheat, oats, rye, corn, potatoes. Rich soil, abundance of water, and a mild climate make Austria one of the foremost agricultural countries of Europe; 95 per cent of the land is productive. The breeding of stock is important. There are more than 4,000,000 horses, a number only surpassed by Germany and Russia. Over 30 per cent of the empire is in forests. Land in most of the provinces is well divided. Nearly 87 per cent of the peasants own their farms, but these are often too small to yield a livelihood. Mining is diversified and the resources rich. Coal is the most important product, worked mainly in Bohemia. Iron is found in large quantities. Copper and gold are also found. The mineral output of Austria was some $55,000,000 in 1890, and $75,000,000 in 1900. Salt is a State monopoly.

Manufacturing has recently made advances, being aided by the government in many ways: low railroad-fares, etc. exemption from import duties. The clothing industry of the empire employs about 800,000 workers; foods and drinks, 600,000; textile trades, 500,000; building trades, 400,000; woodwork, 325,000; iron and steel, 300,000; quarries and potteries, 150,000. Beet-sugar enjoys a liberal bounty. The glass industry is important in Bohemia. Tobacco is a government monopoly.

Wages are low. Ordinary labor averages 20 cents per day in the country and 50 cents in towns, tho varying from 7 to 61 cents. Skilled labor averages 70 cents. Carpenters receive from 61 cents to $1.29 per day. Locomotive engineers earn from 55 to 93 cents. (See WAGES.)

The general efficiency of labor is also low, scarcely averaging one eighth of that of the United States or one quarter that of Great Britain.

Commerce

Commerce is rapidly increasing. The exports of the total empire (Austria-Hungary) rose from 771,400,000 florins in 1890 to 1,084,000,000 fl. in 1905 ($450,000,000), the imports from 510,700,000 fl. to 1,078,900,000 fl. The value of the chief exports (1904) was: sugar, 151,885,000 kronen or half florins (krone = 20.3 cents); eggs, 105,567,000 kr.; cattle, 98,617,000 kr. The chief imports were cotton (raw), 215,226,000 kr.; wool, 129,888,000 kr.; coal and coke, 105,947,000 kr.; silk and manufactures, 83,499,000 kr. The chief exports (1904) were: to Germany, 1,037,321,000 kr.; Great Britain, 183,726,000 kr. (principally wheat and flour); Italy, 156,815,000 kr.; Turkey, 91,436,000 kr.; Switzerland, 79,741,000 kr.; Rumania, 75,868,000 kr.; Russia, 71,741,000 kr.; United States, 70,759,000 kr. The chief imports (1904) were: from Germany, 766,566,000 kr.; United States, 182,461,000 kr. (principally cotton and machinery); Great Britain, 155,076,000 kr. (principally cotton and machinery); British India, 130,436,000 kr.; Russia, 119,863,000 kr.; Italy, 104,617,000. The customs are fixt, common to Austria and Hungary, by the *Ausgleich* or Compromise of 1867.

II.—Constitution and Government

The reigning sovereign is Francis Joseph I., Emperor of Austria (1848) and King of Hungary (1867). Austria and Hungary, by the Compromise (*Ausgleich*) of 1867, are, in most matters, completely independent, each having its own constitution, legislature, and executive, and united only in having the same sovereign and the same management of foreign affairs, of the army and navy, and of matters of finance, common to both. Such matters are regulated by a common ministry and two deputations, one Austrian, one Hungarian, of sixty members each, representing the legislatures of the two countries. These deputations meet annually, alternately in Vienna and Budapest, deliberate separately, and only meet to vote together, without discussion, when there have been three failures to agree by communication. There is also a commercial union, renewable every ten years. In Austria, Baron von Beck is premier. The Austrian Reichsrath has two houses. The Upper House (*Herrenhaus*) has 238 members, of whom 16 are princes of the imperial family, 65 hereditary nobles, 17 archbishops and bishops, and 140 life-members, nominated by the emperor for service or merit. The Lower House (*Abgeordnetenhaus*) has 425 members; 85 represent large landed proprietors (5,431 in 1901), 21 the Chambers of Commerce, 118 the town voters (493,804), 129 the country voters (1,585,659), and 72 the whole body of male voters (5,004,222). At the end of 1906, however, the Reichsrath passed a universal suffrage bill which will completely change this. Bills must pass both houses and be ratified by the emperor. Austria's seventeen provinces have each its diet or Landtage. The parties in the Reichsrath are mainly divided on national or race lines.

With the exception of the Socialists, most parties in Austria proper may be termed Home-rulers. The Czechs, the Poles, the Ruthenians, the Italians, etc., all aim at autonomy in some form or another. The government is carried on by a combination of parties, there being no permanent majority.

Finances

The budget estimate for the common affairs of the empire was (1905) 490,327,883 kr., almost wholly for military expenses. Of this amount 114,716,883 kr. were derived from customs. Expenditures rose from 281,820,000 kr. in 1890 to 368,010,000 kr. in 1904, of which sum Austria contributed 167,107,000 kr. and Hungary 87,630,000 kr., with 113,273,000 kr. from customs.

The estimated revenue for Austria proper (1906) was 1,822,027,401 kr., and the expenditures 1,819,042,210 kr. The Austrian debt (1905) was 3,863,020,074 kr. (See FINANCES.)

The Austro-Hungarian army has on peace footing 318,347 officers and men, and 60,758 horses. The Austrian Landwehr has, besides, 37,032 officers and men, and the Hungarian Honvédsíg 31,491. The yearly contingent for the common army is 59,024 officers and men from Austria and 43,899 from Hungary. The army on a war footing numbers 980,000 officers and men; besides 500,000 in the Landwehr and 1,000,000 in the Landsturm. The navy, mainly coast-defensive, has 12 battle-ships (9 modern), 3 armored cruisers, 22 lesser vessels, and 26 torpedo-boats.

Railways

The Austrian railway system must be studied in the light of its history. First begun by private effort, railways became so necessary that the government aided them by guaranteeing interest or direct State construction. The Revolution of 1848 and the Hungarian war, however, embarrassing it, the government sold out what interest it had in the roads, and Austria went through a long period of speculative railroad-building, ending for many of the roads in failure and bankruptcy. These weaker roads the government, after the crisis of 1873, was compelled first to aid and then to buy and operate. This policy has been largely carried out, but has not been adopted as a system on its own merits as in Germany. Where necessitated by poor private management the government in the main has had to buy simply the poorer roads. Nevertheless the State roads are a success, and the tendency is toward State ownership. In 1903 the State owned and operated 4,809 miles, besides operating 2,671 miles of companies' lines; the companies owned and operated 5,048 miles and operated 18 miles of State roads; 114 miles belonged to foreign lines. In 1906 the State bought another of the largest and best-paying

private roads in the Empire. There were 12,660 miles in all. The cost in 1903 was $1,397,970,000. Passengers carried were 176,467,000; freight, 121,491,000 tons. The receipts were 331,551,000 florins; the working expenses, 225,590,000 fl. The State revenue from the railways for 1906 was estimated at 304,218,570 kronen and the expenditures at 270,410,820 kr. There were 5,947 telegraph-offices, with 40,373.71 kilometers of wire and 16,463,654 messages. The urban telephone systems numbered 429; the interurban systems 134. There were 8,086 post-offices. Receipts (postal and telegraph) were 116,858,886 kr.; expenses, 117,519,722 kr. Of post-office savings-banks there were 6,339, with 1,860,347 depositors and deposits of 471,647,730 kr. at end of the year.

III.—Social Reform

The history of modern social reform in Austria begins with the Revolution of 1848. The years previous to this had been marked in industrial evolution mainly by the decay of the ancient gilds and the development of modern ideas. The Revolution of 1848 witnessed national political uprisings in Vienna, Italy, Bohemia, Croatia, and Hungary. A constitution was granted to Austria, but was soon abrogated, and imperial absolutism, in close alliance with the Catholic power, reigned supreme. In 1859, however, an industrial code was adopted which enjoined upon all manufacturers the maintenance of relations with the gilds, or the restoration of such relations where they had been discontinued, but the gilds continued to decline in spite of all efforts. Progress was mainly political with the distracting complications of an empire of such diverse racial constituents.

In 1866 Prussia gained the severance of Austria from the Germanic Confederation, and Italy soon after gained her freedom. Hungary, too, grew more and more restless, and the emperor had to grant concessions, till the present dual political system was organized in 1867. Since 1879, when Count Taaffe came into power, the government has been compelled to do more and more for the working classes. This, however, has been forced upon the government by the labor party, which in Austria, more than in most countries of Europe, has been purely socialistic.

Socialism

A Viennese Workingmen's Mutual Improvement Society was started under the influence of Lassalle's agitation in 1867; and on April 11, 1869, it published the first number of the *Volkstimme*. In 1869 Austrian delegates were sent to the German Socialist Congress at Eisenach. The Austrian Government now prohibited all Socialist meetings, and the Socialist agitators had to concentrate their efforts to obtain freedom of coalition and universal suffrage.

After the German laws against the Social Democrats were passed in 1878, the Austrian Socialists, in part, lost heart. The Radicals declared for anarchism and the Moderates for the Liberals, working mainly on race lines. Between 1882 and 1884 the anarchists attempted much violence in Austria; the government resorted to strong measures, and the Socialist papers suffered much. Nevertheless, the trade-unions became the camping-grounds for the Socialists, and the propaganda was carried on.

Since 1886 the movement has made steady progress. In 1888 a conference was held at Hainfield, and, largely through the influence of the *Gleichheit*, Dr. Adler's paper, the Moderates and those Radicals who were not anarchists, united on the lines of Marxist socialism. The result was a rapid advance. Socialist papers obtained a wider circulation, meetings for the propagation of Socialist doctrines were held, and many new workmen's associations were founded. Strikes and agitation became common, and the government again tried repression. Papers were suppressed, and the editors of the *Gleichheit* arrested on charges of anarchism.

The winter of 1892 was marked in Austria by agitation on the part of the Social Democrats against the censorship of the press.

The early months of 1893 saw the opening of "a campaign in favor of universal, equal, and direct suffrage." The May Day celebrations took place throughout the empire, and developed into a gigantic demonstration, not only for the eight-hour day, but also for the suffrage. In Vienna 150,000 men and women marched in military order through the streets. A few weeks later the political victories gained by the German Social Democracy at the ballot-box were celebrated throughout the empire. In July 500,000 workingmen and women gathered in the very heart of Vienna and declared they would neither rest nor be deterred by any sacrifice until they had won.

In Oct., 1893, Count Taaffe introduced a bill granting a very much enlarged suffrage. Notwithstanding that by the provisions of the new bill the number of voters in Austria were doubled, the Social Democrats would only agree to accept it as a move in the right direction.

During the last ten years organization has gone on steadily but not rapidly. The Social Democrats in the empire are organized on a basis of "national autonomy and international solidarity." There are German, Czech, Polish, Italian, Slavic, and Ruthenian sections. They work harmoniously, but their progress has been retarded by the national jealousies and political efforts of the different races. In 1897 the government made a further electoral concession. To 383 deputies elected by privileged voters, 72 were added elected by universal suffrage. This at first seemed but to increase the international struggle. By 1901, however, the Socialists polled about 800,000 votes and elected 10 deputies (7 Czechs). The government was compelled to introduce various reform measures (see below), but the old national strife went on, tho largely fruitless to all parties. In 1905, however, a proposition of Baron Fejervary's Hungarian ministry to establish universal suffrage in that country caused widespread excitement in Austria, and on Nov. 2d a monster Socialist demonstration in Vienna led to a clash with the police.

Universal suffrage was finally granted, and as a result, in the elections of 1907, almost a revolutionary change was made. There were elected 82 Social Democrats, 66 Christian Democrats (Anti-Semites), 33 Agrarian Czechs, 31 of the (Catholic) Center; 25 Pan Germanists, 24 German Liberals, 22 Young Czechs, 18 German Agrarians, 15 Clerical Slavs, 14 Free Independent Pan Germanists, 14 Italians, 11 Clericals, 10 Radical Czechs, and 100 of minor parties. There are 2 Socialist dailies in German, the *Arbeiter Zeitung* at Vienna and the *Arbeiterwille* at Gratz. There are 25 other German Socialist journals. The Czech Socialists have also 2 dailies (at Vienna and Prague), and 12 other journals. There are 2 Polish, 4 Italian, 2 Slavic, and 1 Ruthenian papers. The women have a Socialist organ, the *Arbeiterinnen Zeitung*.

A so-called Roman Catholic Christian Socialism has had considerable development in Austria, under the patronage of Prince Alois of Lichtenstein and others, but it has meant little more than the Church of Rome taking an interest in political and social questions from the ecclesiastical-paternal standpoint. It has also contributed largely to the development of anti-Semitism.

Trade-unions

The trade-union movement in Austria runs parallel with the Socialist movement. The Industrial Code of 1859, trying to compel employers and employees to unite in trade-gilds, had failed. In 1869 a demonstration in Vienna won the right of combination for workingmen, and trade-unions slowly developed. A law of 1883 greatly modified the code of 1859. (See STRIKES.) The chief centers of Austrian trade-unionism are the industrial and populous districts of Lower Austria, Bohemia, and Moravia, while about a fifth of the total number of associations are established in Vienna. The highest organization is found in the printing trade and in the textile and metal industries.

The aggregate membership of all labor organizations in Austria in 1903 was 177,592, a net

increase of 13,104 in the year. The rapid progress made since 1892 is shown below:

End of—	Unions	Total number of members	Women included	Annual income	Annual expenditures
1892.....	1,308	70,343	4,263	.....	.....
1896.....	1,634	117,946	5,761	$197,034	$130,167
1899.....	2,263	157,773	9,206	370,488	349,688
1901.....	2,294	152,604	9,928	445,869	422,216
1902.....	2,370	164,488	8,958	523,437	478,508
1903.....	2,469	177,592	12,063	599,473	541,031

There are 74 national trade-unions, containing 154,665 members; 104 local assemblies, with 5,653 members, and 416 workingmen's associations, devoted chiefly to educational work, with 17,274 members. The following table shows the membership, receipts, expenditures, and cash balance of the largest national unions, 11 of which have upward of 3,000 members each. Two other unions, with smaller membership—hatters' and lithographers'—are included on account of their strong financial position. It will be observed that the printers, altho not the strongest union numerically, have by far the largest income It is said that the union contains nearly 90 per cent of all the printers in Austria.

Trade	No. of members	Annual receipts. Crowns	Annual expenditures. Crowns
74 national unions	154,665	2,942,855	2,647,066
Including—			
Railway workers.....	28,036	323,016	340,470

Grand total.....	177,592	2,997,361	2,705,154

Between 1850 and 1860 cooperation began in Austria, but has not had great development. A union of cooperative societies was organized in Vienna in 1874, with 217 societies in 1892. The same year there were 2,501 cooperative societies in Austria, of which 1,882 were loan societies and about 300 distributive.

At the close of 1900 there were 7,616 cooperative societies, including 5,098 credit, 758 distributive, and 1,760 other societies. Of the credit societies, 1,513 were of the Schulze-Delitzsch type, with 923,967 members.

Industrial betterment has at least begun. At Dornbirn, in connection with Herr Hammerle's cotton-mill, a picturesque industrial village has been developed. Cottages, with open verandas, covered with vines and grouped in gardens with fruit-trees, can be hired, with cow shed and pasturage, for some $34 per year, or bought for from $1,060 to $1,500. At Smichof, near Prague, Baron Ringhofer has done much building for the 1,000 men employed in his machine-works. Two-room dwellings or blocks can be rented for 55 cents per week, or 3 rooms for 75 cents. Detached houses are also being built. Baron Ringhofer has established a sick-fund and "welfare institutions."

Industrial Legislation

Industrial legislation is more advanced than cooperation, and recently the government has increasingly followed German precedents.

Accident insurance was made compulsory in Austria in 1887, and insurance against sickness in 1888. The aim is to keep all laborers from dependency. The minister of the interior requires such insurance of all employers where employment is at all dangerous, as in mines, quarries, buildings, factories, etc., and exempts all others. In case of fatal accident. the widow receives funeral expenses, 20 per cent of the husband's wage till death or remarriage, and 15 per cent for each child till the age of fifteen, or, if both parents are dead, such children receive each 20 per cent. Illegitimate children receive 10 per cent each, but the aggregate amount is not to exceed 50 per cent. In case of total disability the injured receives 60 per cent; in case of partial disability the amount is not to exceed 50 per cent.

The postal savings-bank system is more developed in Austria-Hungary than in any other country.

The Austrian provisions against non-employment are: (1) employment agencies carried on for gain, about 916; (2) the ancient trade-gilds, composed of employers and employees, of which there were 5,273 in 1895; (3) employees' associations (trade-unions and others); (4) relief stations on the German plan (see Germany); (5) labor registries, public or private. Vienna and Prague have large municipal registries. The public registries found 95,107 situations in 1903; agencies for gain, 44,034; the trade-gilds, 30,520; other agencies, 74,923.

The government has also made especial efforts in the interest of the industrial middle classes by creating a special department of the Board of Trade, the *Gewerbeförderungs-Dienst* (Service for the Promotion of Handicrafts and Trades), which has had a rapid growth and been imitated in other countries.

The staff consists of a large number of experts in the various trades and crafts, and of men devoted to the cooperative movement; the institute itself may be described as a social laboratory endowed and supported by the state. It has developed also a tendency which is becoming important throughout Austria—the endeavor to apply artistic methods to as many spheres of production as possible. It has a Trade and Crafts' Museum, now in its twenty-sixth year.

Important Austrian social reform institutes or societies are:

Arbeitsstatisches Amt. Vienna, I., Biberstrasse 2. Chief, Dr. Victor Mataja. (Austrian Labor Department or Bureau.)

Gewerbeförderungsdienst des k. k. Handelsministeriums. Vienna, IX., 2, Severingasse 9. Chief, Dr. W. F. Exner. Secretary, Dr. A. Vetter. (Imperial Bureau for the Promotion of the Crafts.)

Arbeiterzeitung (Labor News; Socialist organ). Editor, Dr. V. Adler. Vienna, VI., Mariahilferstrasse 89. (Headquarters for Socialist and labor information.)

Wiener Volksheim (People's Palace). Vienna, XVI., Kofler Park 7. Secretary, Prof. Dr. Emil Reich. (Educational: furthering university extension, libraries, etc.)

Kulturpolitische Gesellschaft. Vienna, I., Giselastrasse. Chairman, Dr. Robert Scheu. (Object: political, economic, and social education in Austria.)

Sozialpolitischer Verein. Vienna, I., Helferstorferstrasse 3. Chairman, Dr. Sigismund Wolf-Eppinger. (Object: social reforms.)

Sozialwissenschaftlicher Bildungsverein. Vienna, VIII., Schlösselgasse 11. Chairman, Dr. Alexander Hollander. (Object: political and economic education.)

Allgemeiner Verband der auf Selbsthilfe beruhenden deutschen Erwerbs und Wirtschaftgenossenschaften in Oesterreich. Vienna, I., Giselastrasse 4. (Object: to protect the interests of the German cooperative societies in Austria.)

Allgemeiner Verband der landwirtschaftlichen Genossenschaften in Oesterreich. Vienna, I., Weihburggasse 12. (A union similar to the preceding, for agricultural cooperative societies.)

Reichsverband der deutschen Gewerbevereine Oesterreichs in Wien. Vienna, I., Eschenbachgasse 11. President, Section Chief Dr. W. F. Exner. (Object: promotion of the interests of German industrial associations.)

Wiener Volksbildung Verein. Vienna, I., Tegetthoffstrasse 4. Chairman, Dr. Friedrich Jodl. (Object: popular education.)

Oesterreichischer Zweigverein zur Hebung des Mittelstandes. (Austrian branch of the *Institut international des classes moyennes*, founded in Brussels, for the development of the middle classes.)

Oesterreichische Friedensgesellschaft. Vienna, I., Spiegelgasse 4. President, Frau Bertha Freiin v. Suttner. (Austrian Peace Society.)

Oesterreichischer Verein gegen Trunksucht. Vienna, I., Spiegelgasse 19. Secretary, Dr. Adolf Daum. (Austrian Temperance Society.)

Allgemeiner Rechtsschutz und Gewerksschaftsverein für Oesterreich. Vienna, X., Laxenburgerstrasse 8. Arbeiterheim. (General Trade Association Union.)

Vereinigung der arbeitenden Frauen. Vienna, I., Tuchlauben II. President, Frau Karoline Gronemann. (Working Women's Club.)

Allgemeiner Oesterreichischer Frauenverein. Vienna, XVIII., Gentzgasse 6. President, Fräulein Auguste Fickert. (General Austrian Women's Union.)

Verein der katholisch geschiedenen Eheleute. Vienna, IV., Leibenfrostgasse 6. (Society of Divorced Catholics, whose object is agitation for legalization of divorce.)

Verein zur Reform des Eherechtes. Vienna, VI., Mariahilferstrasse 5. (Object: reform of marriage law.)

Heimat. Vienna, I., Dorotheengasse 12. Chairman, Adolf Ruzicka. (Girls' Friendly Society.)

Kinderschutzstationen. Vienna, I., Wipplingerstrasse 8. President, Dr. Prince Eduard von und zu Liechtenstein. (Children's Aid Society.)

Verein abstinenter Frauen. Vienna, I., Steindlgasse 2. President, Frau Emilie Kassowitz. (Women's Temperance Union.)

AVELING, EDWARD: Socialist lecturer, born in 1851. He was educated at various schools and at University College, London, and went to Cambridge as Prof. Michael Foster's assistant in physiology. He has been professor of chemistry and physiology at New College, and of comparative anatomy at the London Hospital, and was a member of the London School Board in 1882. An avowed atheist, he became vice-president of the National Secular Society, socialist lecturer, journalist, author, and dramatist. Author: "Student's Marx"; "Student's Darwin"; "Botany for Students"; "Geology for Students"; "Physics"; "Biology"; translations of Marx's "Kapital" (vol. i.); Engel's "Socialism"; Haeckel's "Pedigree of Man"; Titchomiroff's "Russia." He married Eleanor, daughter of Karl Marx.

AVERY, MRS. SUSAN LOOK: Writer; reformer; born at Conway, Mass., 1817; educated at Utica, N. Y.; married (1844) Benjamin F. Avery (died 1885). She has largely devoted her life to speaking and writing on woman's suffrage, temperance, the single tax, and other reforms. *Address:* Louisville, Ky.

B

BAADER, FRANZ XAVIER: German philosopher; born at Munich, 1765. His father counted among his friends some liberal German bishops, and shared their views. Franz Baader studied at the University of Freiburg, where he became the friend of Alexander von Humboldt. In 1826 he was made professor of philosophy and speculative theology at Munich, but desiring the reunion of Protestantism and Catholicism, and having uttered a remonstrance against the absolutism of the Roman court in 1838, he was deposed from his professorship. He gradually became more and more interested in social subjects, and recommended a theocracy, a state held together by Christian love, which should be equally free from lawless individualism and from despotism. Kaufman in his "Christian Socialism" has summarized Baader's view as follows:

> Without previous and perfect union between God and man, social union can neither be effected nor maintained. Social coordination and subordination must rest on Divine authority. All members of the social organism are what they are by the grace of God. Physical force without spiritual power, compulsion without conviction, fear without respect, interest without love, cannot permanently secure social order.
>
> Corporate action and association are essential to the common weal, because they imply organized social life. On the other hand, all attack on property by way of advocating a communistic redistribution is a crime against the common interests of all. The Christian law of mutual affection is the only safeguard against the disintegrating power of individualism. With the development of the moral and religious life of the nation, social evolution will become possible also, and thus the unhealthy elements of social progress will be eliminated without the adoption of revolutionary measures. *The Church must provide a new diaconate* to bring about a more equitable redistribution. The most perfect corporation is the Catholic Church; it is, therefore, the best type of social organization. The Church is altogether opposed to the heathenish view of ownership of property, which is purely selfish, and therefore antisocial, separating private from common interests. The Church regards all men as agents and stewards of their possessions for the common good.

Baader was, however, not destined to make any attempt to carry out his views, as he died in 1841, only three years after losing his Munich professorship. The "Encyclopedia Britannica" says of him:

> Baader is, without doubt, the greatest speculative theologian of modern Catholicism, and his influence has extended itself even beyond the precincts of his own church.

BABBAGE, CHARLES: English economist; born 1792; studied at Trinity College, Cambridge; was made a Fellow of the Royal Society in 1816; helped found the British Association; became professor of mathematics at Cambridge in 1828, and devoted much time and money to the building of two great calculating machines. In political economy, altho he did not contribute to economic theory, he nevertheless won a high place on account of his thorough and faithful descriptions of characteristic economic phenomena. Especially faithful and discerning were his analysis and portrayal of the benefits and effects of the division of labor. Political economy he was one of the first to declare not an exact science, like the mathematical, altho it did depend on "generals being much more frequently obeyed

than violated." He was no blind worshiper of Mammon, and sneered at the notion that no calling could be deemed respectable which did not produce wealth. In the public interest he believed that inventors should be generously rewarded by the state. He died in 1871.

Babbage's main works were: "On the Economy of Machinery and Manufactures"; "Thoughts on the Principles of Taxation with Reference to a Property Tax and its Exceptions"; "A Comparative View of the Different Institutions for the Assurance of Life"; "The Exposition of 1851, or Views of the Industry, the Science, and the Government of England"; "Passages from the Life of a Philosopher."

BABEUF, FRANÇOIS NOEL (called *Caius Gracchus*): French Socialist; born at Saint Quentin, 1760. Left alone at the age of sixteen, his youth and whole life was stormy and wild. From the commencement of the Revolution he wrote violent articles, and was tried, but acquitted. He edited a paper which he called *Tribun de Peuple*. This took place after the fall of Robespierre. He gradually became more violent, and gathered round him a body of men whose main idea was to put down inequality of condition. "We desire," said they, "real equality or death." They met at the Pantheon (till their public meetings were broken up by Napoleon), and there counseled how to rouse the people to insurrection. They aimed at a real community of goods. The public authorities were to organize industry. Every one was to have a right to lodging, food, *mediocre mais frugale*, clothes, washing, warming, lighting, and medical attendance. Babeuf's theory of communism was based largely on Morelly's "Code de la Nature." According to it, "the aim of society is the happiness of all, and happiness consists in equality. Let all the arts perish," cried its followers, "provided we obtain real equality." Government was to be absolute. No private individual was to be allowed to trade with foreign countries. Even within the country only such publications were to be allowed as taught the unqualified blessings of equality. All were to be drest alike save for differences of age or sex. Children were to be removed from the family at an early age, to be taught of "civism" and communism. Comfortable mediocrity was the openly exprest ideal.

Babeuf and his friends had planned a general uprising in May, 1796, but their plot was discovered a few hours before the time set for its execution, and in February of the following year, Babeuf and Darthé were condemned to die. They stabbed themselves before the tribunal, not fatally however, and they were guillotined the next day. Babeuf's last words were, "I wrap myself in a virtuous slumber."

BACON, FRANCIS, VISCOUNT ST. ALBANS: English scholar, philosopher, and diplomat; born in London, 1561; studied at the University of Cambridge at the age of thirteen. He entered diplomacy, and was one of the suite of the English ambassador at Paris. Later he studied law, became a member of Parliament, Solicitor-General, Keeper of the Great Seal, and Lord Chancellor, and was made Baron Verulam, then Viscount. In 1621 he was convicted of corruption in office on his own confession. After this he devoted himself entirely to science and literature till his death in 1626.

Altho dishonorable in public life, Bacon's fame as a literary and scientific man is of the first order. His life was contemporary with the birth of modern science, and with it his name has always been associated. As a literary man Bacon exhibits profound thought exprest in a remarkable and splendid style. There are few subjects with which he did not occupy himself. In his day economic questions did not form a separate study, nor were they of much account. Bacon, however, here and there touches on them, as in Essay xxxiv., "Of Riches," and in the essay on "Plantations." He discusses the government of colonies, and says: "Let there be freedom from custom till the plantation be of strength, and not only freedom from custom but freedom to carry their commodities where they may make their best of them, except there be some special cause of caution." In the "History of Henry VII," and in other shorter works he shows himself a deep student of human and social philosophy. "The New Atlantis" is a brief Utopia written between 1614 and 1617, and published a year after his death. Among his other works may be mentioned: "Essays," "The Advancement of Learning," the "Novum Organum," and the "History of the Reign of Henry VII."

BAGEHOT, WALTER: English banker and economist; born at Langport, Somersetshire, in 1826. He was the son of a banker, and studied at London University. After being called to the bar he chose to enter his father's bank, and later became known as a brilliant literary critic and writer. In 1858 he married the eldest daughter of James Wilson, editor of *The Economist*, and two years later succeeded to the editorship, continuing thus till his death. He was considered one of the best financiers of his day. His special service in economics may be said to have been to reconcile them with history. He had almost unbounded admiration for Ricardo, with whom as a successful man of business he had many points of agreement. "Adam Smith," he said, "discovered the country (of political economy), but Ricardo made the first map." He considered himself the last man of the ante-Mill period. Mill and Cairns had already shown that the old political economy was hypothetic, dealing not with real but imaginary "economic men," who were simply conceived "as money-making animals." In history and life, as Bagehot showed, men are not merely this. He named his great treatise "Lombard Street," not "The Money Market," because he desired to show that he dealt with the concrete and not the abstract. His sympathies were with the capitalists; yet to the working classes and trade-unions he was never hostile. His only remedy was *laissez-faire*. As was natural from his position, his best detailed work was in elucidating the orthodox teaching concerning banking and finance. He died in 1877.

Bagehot's main works were: "History of the Unreformed Parliament"; "Physics and Politics"; "Lombard Street: A Description of the Money Market"; "International Coinage"; "Literary Studies"; "Economic Studies"; and "Biographical Studies."

BAKERY AND CONFECTIONERY WORKERS' INTERNATIONAL UNION OF AMERICA: The bakery trade is one in which great evils exist. Working by hot ovens often in unventilated rooms and not infrequently in underground cellars is

very difficult, much work having to be done at night. The hours are often long and irregular and wages (except for organization) are very low. Frequently the baker, saturated with perspiration sleeps on his table or on flour bags, without undressing, ready for work the next morning. Organization began in New York, and by 1881 New York and Brooklyn had 5,000 union bakers, mainly German. The union struck for twelve hours, but lost and largely went to pieces. In 1885, however, Mr. Henry Weisman started the *German-American Bakers' Journal*, threw himself into building up a national union, with the result that to-day the national union had, 1905, 12,000 members and is working for an eight-hour day. *Secretary*, F. H. Harezbecker, 236 Superior Street, Cleveland, O.

BAKOUNIN, MICHAEL: The father of revolutionary anarchist-communism; born in Torschok, Russia, 1814, of aristocratic and even princely family. Educated for the military service, he became an artillery officer, and was stationed in Poland; but by 1835 became disgusted with Russian militarism, and went to Moscow to study philosophy, reading mainly Hegel and Schopenhauer, in company with Alexander Herzen, the later notorious Russian revolutionist, and others of similar type.

A Communist

In 1841 he went to Berlin, becoming particularly acquainted with Arnold Ruge, and writing in his *Deutsche Jahrbücher*, at Dresden. He was led by Ruge to be a communist. In 1843 Bakounin went to Paris, and there made the acquaintance of Proudhon and his writings, and learned to give to his communistic views an anarchistic basis. In 1849 he resided for a time in Leipsic, surrounding himself with Czech students, and endeavoring to provoke a fresh rising in Bohemia. When in that year the revolution broke out in Dresden, Bakounin joined it. He was, however, captured during a skirmish and condemned to death. On the eve of being shot he was handed over to the Austrian authorities, and tried by them for his part in the Czech rebellion. Again sentenced to death, he was claimed by Russia, and imprisoned in the fortress of Schlüsselburg, and in 1852 transported to Siberia. In 1860 Bakounin reappeared in London, having escaped from Siberia by the way of Japan and the United States. He immediately resumed his advocacy of Panslavism, and became more revolutionary than ever. He wrote in Herzen's journal, *Kolokol* (*The Bell*), and exerted wide influence, among other ways, by his brochure, "Romanoff and Pugatcheff."

When the International was formed in London in 1864, Bakounin did not at first join it; but soon realizing its power, he threw himself into it and became the leader of its anarchist wing against Marx, the leader of the Socialist wing. The names Anarchist and Socialist were not then used save in a vague way; both Marx and Bakounin called themselves communists, but gradually around these two leaders arose the two distinct movements which have since become the Socialist and anarchist-communist movements existing to-day, and completely opposing each other in all European countries. The difference, however, only gradually asserted itself. The International at first was simply an effort to unite the workers of all countries. (See INTERNATIONAL.)

The International

At a congress held in Geneva in 1867, Bakounin favored the abolition of centralized states, and the substitution of voluntary federations of independent communes. At the next congress, in 1868, at Bern, under the presidency of Victor Hugo, he urged joining the International. Failing to convince the assembly, he formed his supporters into a Social Democratic Alliance, the aim of which was to make land and capital the collective property of society, to be used by agricultural and manufacturing associations. Existing states were to "disappear in the universal union of free associations." The Alliance desired to be recognized as part of the International, but its claim was rejected, whereupon it dissolved after six months' existence, during which it had been active in Spain and Italy, and its sections joined the International separately.

On Sept. 28, 1870, Bakounin organized an insurrection at Lyons, but failing in France he resorted to Italy. In 1872, however, Bakounin was to make his break with the Marxian wing of the International. When the congress of the International was to be held in that year, Marx succeeded in having it called at The Hague, where Bakounin could not come, since he would have been arrested in passing through either France or Germany. At the congress, therefore, Marx had it all his own way. In Sept., 1873, both the Marxists and the Autonomists held a congress at Geneva, each claiming to be the true International. The autonomists were the stronger. Bakounin appeared to have conquered. It was the last congress of the Marxist International. The real triumph of Marxian socialism was not then apparent. Bakounin retired to Lugano, in Italy, but returned to Switzerland, and died in Bern, July 1, 1876. Eliseé Reclus, Paul Brousse, J. Guillaume, and others gathered round his grave, and organized the cause to which Reclus later gave the name of anarchist-communism. (See ANARCHISM.)

Bakounin is said, by Reclus, to have been a man of great thought, strength of will, and untiring energy. By Felix Dubois he is described as a man of no original thought, hungry only for a notoriety to be obtained by any means. He was the embodiment of the revolutionist. He wrote of the International:

> We wish to destroy all states and all churches, with all their institutions and laws, religious, political, juridical, financial, magisterial, academical, economical, and social, in order that all these millions of poor human beings, who are cheated, enslaved, overworked, and exploited—having been at last delivered from their masters and benefactors, whether official or officious, whether associations or individuals—may henceforth and forever breathe in absolute freedom.

His ideal of the future was not formulated. He wrote:

The Revolutionist

> All reasonings about the future are criminal, because they hinder destruction pure and simple, and fetter the progress of the revolution. . . . The revolutionist is a man under a vow. He ought to have no personal interests, no business, no feelings, no property. He ought to be entirely absorbed in one single interest, one single thought, one single passion—the revolution. . . . He has only one aim, one science — destruction. For that, and for nothing else, he studies mechanics, physics, chemistry, and sometimes medicine. With the same object, he observes men, characters, the situations, and all the conditions of the social order. He despises and detests existing morality. For him everything is moral that helps on the triumph of the revolution, everything is immoral and criminal that hinders it. Between him and society there is war—war to the death, incessant, irreconcilable. He ought to be ready to die, to endure torture, and with his own hands to kill all who place obstacles in the way of the revolution. So much the worse for him if he has in this world any ties of relationship, of friendship, of love! He is no true revolutionist if

these attachments stay his arm. Nevertheless, he must live in the midst of society, feigning to be what he is not. He must penetrate everywhere among the upper classes, as well as among the middle—into the merchant's shop, into the church, into the government offices, into the army, into the literary world, into the detective force, and even into the imperial palace. . . . He must prepare a list of those who are condemned to death, and dispatch them in the order of their relative misdoings. A new member can only be admitted into the association by a unanimous vote, and after his qualities have been proved, not by words merely, but by deeds. Each "companion" should have under his control several revolutionists of the second or third degree, not wholly initiated. He should consider them as part of the revolutionary capital placed at his disposal, and he should expend them economically and so as to abstract the greatest possible profit out of them. . . . The most valuable element are women who are completely initiated, and who accept our whole program. Without their aid we can effect nothing.

Bakounin's best work is probably "God and the State," which has been translated by B. R. Tucker (1883). His other writings were mainly attacks upon Marx and Mazzini, or violent "Bulletins of the Federation of the Jura."

BALANCE OF TRADE: The difference between the amount or value of the commodities exported from and imported into a country. The balance is said to be favorable to a country when the value of its exports exceeds that of its imports, and unfavorable when it is *vice versa*. This is derived from the old idea long prevalent, but especially developed by the MERCANTILISTS, that wealth consists only, or at least mainly, in money, and that therefore that country which exports more commodities than it imports must be rich, since it receives money in excess of what it pays for its imports. Clement Armstrong, in his "Treatise Concerning the Staple and the Commodities of this Realme" (1530), says: "The holl welthe of the realme is for all our riche commodites to gete owt of all other realmes, therefore redy money; and after the money is brought into the holl realme, so shall all peple in the realme be made riche therwith." This was the universal theory in the Middle Ages, when there was what has been called a "balance of bargain" theory, each state striving on every bargain to obtain a balance of money. The first real refutation of the theory seems to have been by Nicholas Barbon in 1690, tho it remained largely accepted till the onslaught upon it by Hume in his "Essays" (1752), and the more calm and judicious analysis of Adam Smith. To-day, when it is seen that wealth may consist in many things besides money, the absurdity of the theory is apparent. See Buckle's "History of Civilization in England," vol. i., pp. 210–212; W. Cunningham's "The Growth of English Industry and Commerce," p. 362; C. F. Bastable's "The Theory of International Trade," p. 164 (Dublin, 1887).

BALL, JOHN: English priest and revolutionist; born 1338; studied at St. Mary's, York, and was ordained to the priesthood not long after 1356, becoming one of the class of parochial chaplains, who corresponded among the clergy to the artizan class among the laity. It was toward the end of the long reign of Edward III. that the "mad priest," as it suited the landowners to call him, began to prophesy against the evils of his time; and, as John Richard Green has said, "in the preaching of John Ball England first listened to the knell of feudalism and the declaration of the rights of man." England was ripe for the message. The years of prosperity following the plague of 1348 had done more to open the eyes of the peasants than all the centuries of poor rations which had gone before. At first by royal proclamation, and subsequently by the repeated enactments with added penalties of the famous "Statute of Laborers," every effort was made to defeat the rising prosperity of the artizans and peasants, but every resistance only fanned the flame.

Such were the conditions amid which Ball began his life-work, and for twenty years preached Lollardism of a coarser and more popular sort than that of Wycliffe. He traveled from place to place, and preached in churchyards and from the market crosses to crowds, which were ever increasing as he incurred the greater displeasure of the authorities. He insisted on the necessity of marriage of the clergy, on a voluntary priesthood, and on the injustice of demanding tithes from poor men. From the headquarters which he maintained in Essex his work extended in all directions, and he gradually became the recognized head of an ever-growing labor party, whose sections in the different parts of the country were united by a great band of itinerant priests, whose office enabled them to travel unsuspected in every direction. While all this was going on events were rapidly preparing the way for insurrection. The peasants were filled with what Professor Rogers calls a "religious socialism." The actual outbreak was delayed by several causes, for the leaders were loath to provoke an appeal to arms, tho as early as 1375 they seem to have decided that it would ultimately be necessary. Between 1375 and 1377 riots were frequent, and the people were held back with great difficulty. Then Edward III. died, and the hopes of the popular party for a better state of things were revived for a short time, while the troubles with the French helped to distract attention from the troubles at home. But when defeat abroad added to misery at home was capped by a fresh tax levy, to which the poor were compelled to contribute as much as the rich, the suffering became unbearable. In the early part of 1381 Ball began sending letters to his party everywhere, saying that the time for action had come. In April he was imprisoned, first in Maidstone jail and then in the archbishop's palace at Canterbury; but his plans were too well laid to be so frustrated, and in June the storm burst. The people rose simultaneously in all parts of the country. Canterbury, where "the whole town was of their sort," was thrown open to the insurgents, who plundered the archbishop's palace and released Ball, who thenceforth became the heart of the movement, as Wat Tyler was its military head. Then they moved on London, occupied Blackheath and Southwark, and sent their demands to the king, at the same time crossing the bridge and burning the new palace of the hated John of Gaunt and the hospital of St. John. The best of order and discipline were maintained; gold and silver vessels they smashed with axes, jewels they brayed; they stole nothing. This was between the 11th and the 13th of June. On the 14th the insurgents insisted on a conference with the king, and he came forth from the Tower, and met them almost alone at Mile End, giving assent to their demand: "We will that you make us free forever, ourselves, our heirs, and our lands; and that we be no more bond or so reputed." He set clerks at work writing charters

His Life

Wat Tyler's Rebellion

of manumission, and giving these to them, he bade them go home at once, which many did, thus weakening their strength through division. On the 15th, while Tyler was conferring with the king alone, and under the protection of a safe-conduct, he was murdered by Walworth, the mayor, and the rebels having lost their chief and leader, fell into the stratagem of the king, who put himself at their head and persuaded them to leave London altogether. Ball seems to have made an unsuccessful attempt to rally the peasants again; but, being caught at Coventry, was hanged, drawn, and quartered, after the fashion of the time. "The peasants were dispersed and defeated," says Professor Rogers; "their leaders were tried, sentenced, and hanged; but the solid fruits of victory rested with the insurgents of June, 1381. Once in the history of England only —once, perhaps, only in the history of the world —peasants and artizans attempted to effect a revolution by force. They nearly succeeded—at least they became for a short time the masters of the situation. The English laborer, for a century or more, became virtually free and constantly prosperous."

BALLANCE, HON. JOHN: The first Liberal-Labor Premier of New Zealand; born in 1839; the son of a north Irish tenant farmer. Apprenticed to a Dublin ironmonger, he went to New Zealand in 1866 and became a sheep farmer; soon, however, he started a jeweler's shop, and later a paper. In 1875 he was elected to Parliament, and became a member of the cabinet from 1877 to 1879 and again in 1884 and 1887, and prime minister from 1891 till his untimely death in 1893. He gained his popularity largely by being the first promoter of New Zealand's present land system, in opposition to private monopoly in land. He inaugurated the village-settlement plan in 1886; was the author of the first land-value tax law; and took a leading part for manhood-suffrage. In 1890 he succeeded in uniting the Liberal and the Labor leaders; and on becoming premier he inaugurated the era of radical reforms with regard to land, etc., which has made New Zealand so prosperous.

BALLOU, ADIN: Founder of Hopedale Community; born in Cumberland, R. I., 1803. His ancestor, Maturin Ballou, in 1646 aided in founding the city of Providence, R. I. At eleven years of age Adin Ballou felt a fervor of the Divine spirit, and at eighteen he preached his first discourse. He became a Universalist, published books and pamphlets, and edited many papers on reformatory subjects. In 1841 he founded the HOPEDALE COMMUNITY in Massachusetts, which, as long as it remained under his management, succeeded in doing the good it started out to accomplish. Ballou remained at its head for over ten years, but was finally superseded by an intriguing business man, who got the lead and ruined the community. Mr. Ballou died in 1890. (For his views, see HOPEDALE.)

BALTIMORE, MD.: Social reform movements in Baltimore are characterized by qualities growing inevitably out of the somewhat unique position and history of the city. With a large negro population (a larger negro vote than any city in the union except Washington) the city has its full share of ignorance and poverty, and yet, descending from its early history, traditions of aristocracy and in some ways of feudal relationship between the rich and the poor, which are not common in the United States. Such relations exist elsewhere in the South, but in many ways Baltimore is not a Southern city. A situation favorable to commerce early developed a considerable foreign trade and local manufacture. The trade of the "Baltimore clippers" before the war became famous. Tho this was cut off by the war and hurt by the great fire of 1904, the city emerged from that experience to develop a very energetic commercial and industrial life.

History

The aristocratic element came first. The foundation of Baltimore in 1829 was under the influence of the proprietary government of Maryland. It had been the intention of Lord Baltimore, the first lord proprietor, to found a feudal state, largely for Catholics, tho Protestants were to be free to dwell there and conduct their faith. Maryland early outgrew this intention, but the influence of its beginnings has never wholly disappeared.

Ignorance, however, soon followed. Slavery was introduced and Maryland became a slave-holding state. Strong influences from Washington as well as in the State, in period of the rebellion, saved Maryland from seceding, but large numbers of her people sympathized with the South and many entered the Confederate army. After the close of the war the proximity to the South induced many colored freedmen to settle in Baltimore, providing her citizens and her commerce with cheap labor, and her politicians with a large element that could be easily bought. In 1900 Baltimore had a population of 508,957, of whom 79,739 were colored, 68,600 were foreign born, a small proportion for the U. S. The illiterate population was 29,148, of which 17,037 were colored and 12,111 "poor whites." Such conditions mean a low standard of labor, and Baltimore has never been a strong trade-union city. Commerce, however, has flourished.

Equally, however, until recently, has political corruption flourished, and Baltimore passed through a great period of municipal corruption in connection with public connivance with Senator Gorman's Democratic machine. In 1885, however, a Reform League was organized, and a fight upon corruption begun. For ten years, however, little or no impression was made. Only in 1895 did it succeed, through activity and watchfulness in ward clubs, in defeating the city machine, and electing a Republican governor and U. S. senator. But this was in part (tho not wholly) a mere party victory. In 1898, however, a new and progressive charter was obtained, going into effect March 1, 1900.

Corruption

Executive functions are vested in a mayor elected for four years, a few other officials, and in seven executive departments: Finance, Law, Public Safety, Public Improvements, Public Parks and Squares, Education, Charities and Correction, Review and Assessments. These officials (except the controller) and heads

New Charter

of departments were appointed by the mayor, subject to approval by the Second House, giving, therefore, very centralized responsibility, especially since they may be removed by the mayor, at pleasure, for the first six months, and after that by trial and for cause. The sole power of money appropriations is in a board of estimates, all of whom are elected by the people. No money can be appropriated unless actually in the treasury, a condition which works for honesty, conservatism, and against municipal operations. A separate spring election has called attention to city conditions as apart from the state and country, and has resulted in the election of better councilors. The result has been that Baltimore is almost unique among the large cities of the U. S. in not having the question of corruption prominently up for the last ten years, Much of the credit for this is due to the first mayor under the new charter, Thomas G. Hayes.

Civic Reform

The better element of citizens, however, have largely helped. The Baltimore Reform League is a somewhat small and compact organization of influential citizens, but a Municipal League, organized in 1905, enrolls 3,000 members.

It is in part due to Baltimore's wealth and aristocracy that the city, in spite of many ignorant citizens, has long ranked as one of the foremost educational centers of the country. Johns Hopkins University, opened in 1876 by the munificence of a Baltimore merchant, has been a pioneer in postgraduate study and has influenced the whole city. A Roman Catholic seminary and college, a woman's college, two colored advanced institutions, besides various professional schools and departments of the University of Maryland, increase this influence. The Enoch Pratt Free Library has 200,000 volumes and several branches. The Peabody Institute, founded by George Peabody, who laid the foundations of his wealth in Baltimore, has 145,000 volumes, art gallery, and conservatory of music. Public schools are also well developed, one of the chief successes of the new charter being in its freeing of the schools from politics and the development of the Department of Education.

Charity has been well organized in Baltimore. A fine Federated Charities Building was opened in 1903. The Lawrence House Settlement (founded 1893) and the more recent Locust Point Social Settlement are doing good work. Several churches have well-appointed parish houses for social work and many now show considerable institutional activity.

Charities

The following are some of the more important social and charitable institutions:

Federation Charities Building, 101 West Saratoga Street.
Lawrence House, 816 West Lombard Street.
Locust Point Social Settlement, 1504 Fort Avenue.
Baltimore Reform League, 18 East Lexington Street.
Municipal League, 126 Law Building.
Socialist Headquarters, 1011 East Baltimore Street.
Young Men's Christian Association, 302 North Charles Street.
Young Women's Christian Association, Park Avenue and Franklin Street.
Woman's Christian Temperance Union, 516 Park Avenue.
State Board of Education, Carrollton and Lafayette Avenues.
Baltimore Federation of Labor, Baltimore and North Streets.
Labor Leader, 27 Franklin Building.
Labor Lyceum, 1011 East Baltimore Street.
State Bureau of Industrial Statistics, 100 Equitable Building.

BANDS OF HOPE: Temperance organizations for juveniles, established throughout all English-speaking countries. In the United States the name has been generally changed to "Loyal Temperance Legion," altho some local organizations are continued under the old name. The Band of Hope pledge in this country is as follows: "I hereby solemnly pledge myself to abstain from the use of all intoxicating drinks, including wine, beer, and cider, as a beverage; from the use of tobacco in every form, and from all profanity."

The first society called a Band of Hope was formed in Leeds, England, in 1847, more than 200 children taking the pledge: "I promise to abstain from all intoxicating drinks as beverages." In Great Britain there are probably over 2,000 juvenile temperance societies of one kind or other. In 1851 the first Band of Hope Union was formed. Its sphere of work is in Bands of Hope, Sunday-schools, day-schools, colleges, orphan asylums, industrial and district schools, training ships, reformatories, and the homes of the children. The latest estimate of the strength of the movement shows that there are nearly 15,000 Bands of Hope and juvenile temperance organizations in Great Britain, with upward of 20,000 members.

BANK OF ENGLAND: Established in 1694 with a capital of £1,200,000. It was projected by William Paterson, a Scotchman who had had business experience in America. In 1816 the capital reached £14,553,000, the present amount, with a reserve fund of £3,000,000. Its issue department is limited to £14,000,000, tho this may be increased if other note-issuing banks discontinue issues. The Bank of England pays £180,000 a year for its exclusive privileges, and is paid £247,000 a year (less charges of £124,000) for acting as the government's banker in managing the national debt, loans, bonds, and much of the colonial business. In case of panic the government can permit the bank to issue notes beyond the legal amount, and this usually ends the panic. The bank is controlled by a governor, a deputy, and twenty-four directors, elected by the stockholders.

BANK OF VENICE, THE: This famous bank, which has played an important part in monetary discussion, dates according to some from 1171, and according to others, from 1619. This is because the latter authorities deny that up to 1619 it was a bank in any modern or correct sense of the word. Stephen Colwell, in his "Ways and Means of Payment," has made this bank an argument for the practicability of fiat money, tho these conclusions are severely criticized by their opponents. Mr. B. S. Heath, in his "Labor and Finance Revolution," says in brief:

Stephen Colwell's digest of fourteen authorities leads to the following deductions, as will be seen by perusal of his able work:

It proves that there was a national bank of Venice founded on a loan of 2,000,000 ducats spent by the State in 1171, and the bank existed within the memory of living men, a period of 626 years, during which time it was gradually enlarged over 700 per cent.

That, in 1423, the 4 per cent interest previously paid was abolished.

That all promise of reimbursement, other than transfer of credit receipts, was abolished.

That no coin was kept as a specie basis of credit, or for strengthening the nation.

That no promise to pay any coin was made after 1423, for nearly 400 years of its continuance.

That the premium fixt by law of 20 per cent premium over the Venetian gold ducat, so celebrated for its fineness in ex-

port, was a real superiority of legal money of account over the commodity gold, and over gold currency.

That it was not dependent on any promise of convertibility or redemption in gold, as no claim for any gold was acknowledged in the National Bank.

That it continued for nearly 400 years with all these extraordinary attributes, producing no financial derangements and no opposition; but, on the contrary, grew until it exceeded the money per capita of any nation in Europe, ancient and modern, and was the pride of Venice, the envy of Europe.

That it only fell when Napoleon conquered Venice, when it had reached an issue exceeding $16,000,000 of government credit or money for 200,000 people, excluding the dependencies of Venice.

On the other hand, Professor Dunbar, in Palgrave's "Dictionary of Political Economy," gives an account different in several essential points. According to him, the bank was simply a bank of deposit under public officers. In 1619 it was changed into the Banco del Giro, long known as the Bank of Venice. It received funds both for the State and individuals, making a small charge for holding private deposits. Transfers were made upon the books by the order of depositors; bills of exchange were paid, and the tender of payment for any sum not less than 100 ducats could not be refused. Loans to the government compelled it to suspend more than once, especially from 1717–39. For the greater part of its existence, however, it received or paid out cash on demand. It kept its accounts in ducats *banco*, which had no corresponding coin, but were credited or redeemed by the bank as might be required at an advance of 20 per cent, above the ducat *effectivo* of the mint. Whatever be the origin of this, it seems finally to have represented a mere difference of denomination.

BANKS AND BANKING: A bank may be defined as an institution for receiving money at or without interest, for loaning, discounting, or transmitting money, and sometimes for issuing notes. (See SAVINGS-BANKS; COOPERATIVE BANKS; CURRENCY.)

I.—General History

The name "bank" is derived from the Italian *banco*, a bench, from the benches in the markets on which the early money-changers were wont to sit. Passing by obscure references to money-lenders and usurers on Assyrian tablets in Egyptian records and classic and sacred literature, the origin of modern banking is largely to be found in Florence, altho the BANK OF VENICE was the first real bank. The names of the Bardi, Acciajuoli, Peruzzi, Pitti, and Medici were famous throughout Europe. In 1345 the Bardi and the Peruzzi, the two greatest mercantile houses in Italy, failed. Edward III. owed the Bardi 900,000 gold florins, which his war with France prevented him from paying; and the King of Sicily owed them 100,000 gold fl. The deposits of citizens and strangers with the Bardi were 550,000 gold fl. The Peruzzi were owed 600,000 gold fl. by Edward III. and 100,000 by the King of Sicily, and the deposits they owed their customers were 350,000 gold fl. The fall of these two great pillars of credit involved that of multitudes of other smaller establishments. The city, however, recovered from this terrible disaster, and we find that between 1430–33 seventy-six bankers at Florence lent 4,865,000 gold fl. At one time Florence is said to have had eighty bankers, but not any public bank.

Early Banks

The first bank to be established on really modern principles as a bank issuing notes payable to bearers at sight is the Bank of Sweden, established by a Swede named Palmstruck, in 1656. Its first bank-note was issued in 1658. This bank became the Riks Bank (National Bank) of Sweden in 1688, and still carries on business as such. Banking in Germany, save for the great Bank of Hamburg, presents little of interest. Each German state had its own banking laws and banks of issue, confined mainly to its own neighborhood. After the unification of the empire by an act of 1875—the Bank of Germany was established, and thirty-two banks were recognized as possessing rights of uncovered issue of 135,000,000 marks, the bank of Germany being allowed 250,000,000 mk. The state itself has the right of issue of 120,000,000 mk. in small denominations. France has many large banks besides the Bank of France, among others the Comptoir d'Escompte, founded 1848; the Crédit Foncier and Crédit Mobilier, 1852; the Crédit Lyonnais, 1863; the Société Générale, 1864.

Continental European Banking

England has many old banks. Says Mr. Courteney: "The still existing bank of Messrs. Smith & Co., of Nottingham, the parent of the London establishment of Messrs. Smith, Payne & Smiths, claims to have been established in 1688; the Bristol Old Bank (Messrs. Baillie, Cave & Co.) dates from 1750; the Hull Old Bank (Messrs. Pease & Co.) from 1754; and many other country banks trace back their history to the latter half of the 18th century. It is believed that all these bankers issued their own notes payable to bearer as part of their business; and they were not very scrupulous in regard to the magnitude of the sums for which they were given. The Bank of England had not issued any notes for less than £20 previously to 1759, when it commenced the issue of £10 notes; but the country bankers put in circulation notes for such small sums that Parliament enacted, in 1775, that none should be issued for less than £1. In 1777 this minimum limit was further raised to £5, but in spite of this restriction the number and the amount of the issues of the country bankers soon became dangerously multiplied."

Banking in England

In 1792 there were said to have been 350 banks. In the panic of 1792–93, about 300 banks suspended payments, and 50 were totally destroyed. After the panic, however, banks gradually multiplied till 1825, when the circulation of notes of less than £5 was forbidden. Joint-stock banks with any number of partners were allowed to issue, but did not multiply again till 1834–36, when there was a rush into banking, leading to the passage of the Banking Act of 1844. (See BANK OF ENGLAND.)

II.—Banking in the United States to the Period of the War of the Rebellion

As early as 1690 the colony of Massachusetts issued bills of credit, making the paper legal tender for taxes and other debts, the notes being payable to the bearer on demand. This was five years before the establishment of the Bank of England; and William Paterson, the father of that bank, had been in the colonies and studied the Massachusetts experiment. This

Colonial Period

issuing of bills of credit was repeated with various modifications by Massachusetts and the other colonies through all their history. (See CURRENCY.)

In 1739 a land bank and a specie bank, according to modern banking methods, were started in Massachusetts. The latter, however, closed in 1740, when Parliament extended the old Joint-Stock Companies' Act (passed after the South Sea Bubble, 1720) to the colonies; the former bank, however, struggling and battling for its life for the next ten years.

Bank of North America

Dec. 31, 1781, Congress chartered the Bank of North America in Philadelphia. It had a capital of $400,000, and took its origin in a union of citizens of Philadelphia, formed to supply the army with rations. They were allowed to issue notes to buy the articles required. Congress ordered bills drawn on American ministers abroad to be deposited in the bank as a guaranty of payment; $70,000 in specie were subscribed by individuals in 1782, and the remainder by the government, out of the proceeds of a foreign loan. It issued convertible notes, redeemable in Spanish dollars; but the people were slow to take them. However, it made large dividends, and was attacked by a rival, which it was obliged to absorb.

The first bank of the United States under the Constitution was chartered by Congress in 1791. The capital was $10,000,000. One fifth of the stock was owned by the United States and $8,000,000 by the people. Six of the eight millions were government indebtedness; and $2,000,000, money. Notes of the bank were made receivable for all obligations due the government for twenty years, or during the life of the charter. The bank always paid coin when demanded, but the notes were legal tender to the government, and, therefore, satisfactory to the people, whether the bank paid coin or not. This was made plain by the law, and was demonstrated in the last four years of the life of the charter, when the most bitter controversy was carried on between the bank and the president and cabinet. When the time came to renew its charter (1811), ninety state banks had grown up to oppose it. It had been successful, and paid 8 or 10 per cent a year to its stockholders. It was charged that the bank controlled elections in the state, and was then laboring to control those of the nation. Reports charging the bank with corruption, and even insolvency, were circulated, and the charter was not renewed.

The following table, from the report of the Controller of the Currency for 1892, gives a convenient *résumé* of the banks in the United States in the period we are now considering:

SPECIE, CIRCULATION, CAPITAL, AND NUMBER OF BANKS IN THE U. S., 1774–1804

YEAR	No. of banks	Specie	Circulation	Capital
1774	.....	$4,000,000	.....	.....
1784	3	10,000,000	$2,000,000	$2,100,000
1794	17	21,500,000	11,600,000	18,000,000
1804	59	17,500,000	14,000,000	39,500,000

From 1800 to the War of the Rebellion

Banking of the wildest kind was now the rule. After 1805 notes were allowed for sums under $5, and finally were issued as low as for twenty-five cents. Specie was driven out. A crash came in 1809. Severe bank laws were passed. In 1813 the New England Bank was chartered as a bank of redemption at Boston, in order to keep the paper of the adjacent county at par. It did this, but was unpopular, and was the beginning of the Suffolk bank system.

The note circulation of the banks of the country is estimated, in 1811, by Gallatin, at $46,000,000. The country being at war, $57,000,000 were borrowed by the government from 1812 to 1814. Treasury notes for one year were issued in 1812 to the amount of $3,000,000; in 1813, to $6,000,000; and in 1814, to $8,000,000. Silver flowed to New England. In 1814 all the banks save those in New England suspended payment. Notes were depreciated from 20 to 50 per cent. The Secretary of the Treasury now began to be engaged in the money market. He tried to get the banks to come to some agreement. He ordered that taxes should be received only in specie, treasury notes, or notes of banks which received treasury notes at par. Madison recommended another national bank.

The second United States bank was finally opened Jan. 1, 1817. It began business with $1,400,000 in specie, $14,000,000 in stocks, and the rest in stock notes. It was to have a capital of $7,000,000. A second instalment of $2,800,000 was soon due, but only $32,400 was paid in specie, the rest mainly from notes or discounts of the bank itself. The third instalment was still worse. The bank discounted its own stock at par to pay the instalment. In Aug., 1817, the bank discounted its own stock at 125. The facilities for stock-jobbing were used. Congress resolved that after Feb. 20, 1817, only specie, treasury notes, and notes of specie-paying banks ought to be taken by the national treasury. The banks refused to resume before July, 1817. The Western banks were still comparatively sound. The Southern banks had become inflated. The inflation was increased during the year by the government paying off $11,000,000 of the public securities held by the banks. The note circulation at this time is estimated at $100,000,000.

The Second National Bank

By March, 1818, the discounts of the United States Bank were $43,000,000—$11,000,000 on stocks. It had $2,000,000 in specie. It had now eighteen branches, but only $3,000,000 of specie in them all. Its operations in the West drew that region into the "golden" age. The bank now bought $7,000,000 bullion in the West Indies. Fifteen months after it was started it was doubtful if the bank was solvent. In November, Congress appointed a committee of investigation, which reported unfavorably; but Congress would not respond, forty members being stockholders. The bank now took energetic measures to save itself, and in seventy days was solvent, but had ruined the community. In Aug., 1819, there were 20,000 seeking work in Philadelphia, and a similar state of things existed in other cities. Land in Pennsylvania was worth, in 1809, $38 per acre; in 1815, $150; in 1819, $35. The note circulation of the country in 1812 was about $45,000,000; in 1817, $100,000,000; in 1819, $45,000,000. Financial distress was general and lasted till 1823. Money was plentiful in the hands of those who had no debts to pay, as they would not invest. In 1823 the circulation of the United States Bank was very low—$4,081,842; but there was a great creation of banks, and the bank began to expand and receive the notes of all its branches.

In 1826 there was dulness and reaction throughout the year. In 1827 money was plentiful, and continued so with some changes till 1831. President Jackson commenced his attack on the United States Bank in his first message (1829). About 1830 American securities began to attract English investments, in canals, steamboats, and, later, in railroads. Currency, however, became more and more of a political issue.

The Bank War, 1832–1836

Jackson committed his party to hard money. In 1832 the United States Bank petitioned for a renewal of its charter, which was to expire in 1836. The bill passed both Houses, but was vetoed by the president. A violent warfare was now begun by the bank. It is certain

that the bank had paid little heed to the laws of the state or of prudence, expanding or contracting according to will. In 1832 Jackson defeated Clay by 288 to 49 in the electoral college. In his message in Dec., 1832, he recommended the sale of the $7,000,000 stock of the United States Bank which was owned by the nation, and an investigation into the bank. Bank shares fell from 112 to 104, but recovered to 112 on a favorable report of the treasury agent. This report showed $79,000,000 assets and $37,000,000 liabilities, besides $35,000,000 capital and $7,000,000 surplus. But when the government desired to pay the 3 per cents in July, 1832, the bank agreed to pay the interest on them if the payment might be delayed so long. It then negotiated a loan of $5,000,000 from Barings, the reason given being fear of the cholera. This caused fear for the public deposits, but a resolution that they were safe was carried, through the influence of the bank, 109 to 46. After Congress adjourned (Sept. 22, 1832), the president ordered Mr. Duane, the secretary of the treasury, to remove the public deposits from the bank. He refused, and was replaced by Mr. Taney, who did it. The order was that the collectors should send no more deposits to it, but to state banks. There was no sudden transfer, but it was proposed to withdraw at intervals. The bank began war, and began to draw in its loans. On the assembling of Congress, the Senate resolved (28 to 18) that the president had usurped unconstitutional powers. The House never noticed the resolution, but resolved (134 to 82) that the bank charter should not be renewed. The contraction of the money market caused great distress. It was stated that the bank caused this to obtain a renewed charter. It was claimed that they loaned to a select few who reloaned at usurious rates. The aggregate amount of loans, however, steadily decreased all these years.

Meanwhile, the bank war went on. The bank, finding that it could not coerce the people, and that smaller banks were taking its place, changed its policy and expanded, President Jackson using this as a proof that it had unnecessarily contracted before. The president induced many of the states to pass laws forbidding the issue of small notes, and this largely favored convertibility. These were times when cotton could command good prices, and railroad and other investments and speculation were good. The public debt was now nearly extinguished. On July 11, 1836, the president issued the famous Specie Circular, by which he ordered agents for the sale of public lands to take specie only. Congress in December passed an act rescinding this, but it did not become law, the president not signing it. The United States Bank not being able to renew its charter, now obtained a charter from Pennsylvania—by bribery, as it was asserted. It had not yet paid back the government stock or the dividends which it held for contracting a loan with France that finally never materialized. It continued to reissue the notes of the old United States Bank which it received. Gold, being forced on the market in this country, came here from England. In April, 1836, the gold reserve in the Bank of England began to lower, and this continued all summer. Nowhere had paper money been more in use than in the South. In March, 1837, several New Orleans houses failed. Next, the pressure was felt in New York, and then became general. There were 100 failures in New York in March, and the losses were $15,000,000. In March a meeting was held in New York, addrest by Webster. He laid the trouble to the government interfering with the currency and to the Specie Circular. A committee of fifty was sent to the president (Van Buren) to ask for its rescinding. The committee, in its address, spoke of 250 failures and 20,000 individuals discharged by their employers, and they laid it all to the effort to put metallic in place of paper currency. But they could obtain nothing from the president. In May the New York banks suspended in a body, a law being passed allowing them to suspend for one year. Suspension became general through the Union. Specie was driven out of the market, and all kinds of notes circulated instead. The New York banks then began to contract to be ready to resume. Nearly all the banks made money by the suspension, and paid good dividends during the year. In 1838, Congress passed an act forbidding the Pennsylvania Bank of the United States from using the old United States Bank notes. On May 10, 1838, most of the banks in New York City and in the Union resumed, the Bank of England sending $1,000,000 to aid them. There was a general revival of trade, but it was not permanent. Gold in the Bank of England again declined. The Bank of Belgium failed. The Bank of England borrowed £2,500,000 of the Bank of France. During the same year the Bank of the United States became involved in cotton speculation. Several banks, especially in the South and West, failed. The management of the United States Bank became reckless. It owed from $10,000,000 to $20,000,000, and tried to borrow of various banks in Europe. On Oct. 10, 1839, it failed, and carried with it all the banks of the South and West. Three hundred and forty-three out of 850 banks in the Union closed entirely, and 62 partially. Some $2,000,000 of government deposits were lost. This suspension lasted by law till Jan. 15, 1841. As soon as the bank opened again a run on it commenced, and it suspended finally Feb. 4, 1841. Its capital was a total loss, the shareholders receiving nothing. But all the creditors and all the circulating notes were paid in full, principal and interest, and the United States Treasury cleared some $6,000,000 above the $7,000,000 originally paid in.

The Panic of 1837

Widespread Depression

When it failed the Bank of the United States owed the Bank of England $23,000,000. Its failure, and, above all, the repudiation of indebtedness by several states ruined American credit abroad, and cost the bank many friends here.

In 1840 the Independent Treasury Act was passed, giving the government the custody of its own funds. It was only accomplished after a severe struggle, as it withdrew the public funds from use as banking capital.

Number of Banks in the U. S., their Capital, etc., in the Years 1811–40

Year	No.	Capital	Circulation	Specie
1811	89	$52,720,601	$28,100,000	$15,400,000
1830	330	145,192,268	61,323,898	22,114,917
1840	722	358,442,692	106,968,572	33,105,155

Among the new measures were the Suffolk Bank plan in Massachusetts, and the New York Safety-Fund System. The Suffolk Bank plan was merely an arrangement whereby

that bank was made the channel through which all notes of New England banks that found their way to Boston, as most of them naturally did, were at once forwarded to the issuers for redemption. The New York Safety-Fund System, which is the cardinal principle of the present national banking plan, required each bank to deposit, with the banking department of the state, securities consisting of federal or state stocks, or bonds and mortgages, which, in case of the failure of the bank, were sold, and the proceeds applied to the liquidation of its debts.

From 1844 things began to mend. Railroads were rapidly developed, and the discovery of gold in California added another powerful element to the industrial development. Our credit abroad slowly mended. By 1854 it was estimated that $200,000,000 of state, railway, and other bonds were held abroad, and in 1857, $400,000,000. Bank-notes expanded. Gold was exported; currency set toward the financial centers, the country banks keeping their balances generally in New York.

1840–1860

The following tables from the report of the Controller of the Currency for 1892, give the position of the state banks from 1834–63:

Year	Liabilities					
	No. of banks	Capital stock	Circulation	Deposits	Due to banks	Other liabilities
1834	506	$200,005,944	$94,839,570	$75,666,986	$26,602,203	.....
1839	840	327,132,512	135,170,095	90,240,146	53,135,508	$62,946,248
1844	696	210,872,056	75,167,646	84,550,785	31,998,024	5,842,010
1849	782	207,309,361	114,743,415	91,178,623	30,095,366	6,706,357
1854	1,208	301,376,071	204,689,207	188,188,744	50,322,162	13,430,276
1859	1,476	401,976,242	193,306,818	259,568,278	68,215,651	15,048,427
1863	1,466	405,045,829	238,677,218	393,686,226	100,526,527	53,814,145

Year	Resources							
	Loans and discounts	Stocks	Due from banks, etc.	Real estate, etc.	Notes of other banks	Specie fund	Specie	Other resources
1834	$324,119,499	$6,113,195	$27,329,645	$10,850,090	$22,154,919	$26,641,753	.....	$1,723,547
1839	492,278,015	36,128,464	52,898,357	16,607,832	27,372,066	3,612,567	$45,132,673	28,352,248
1844	264,905,814	22,858,570	35,860,030	22,520,863	11,072,473	6,729,080	40,808,269	12,153,693
1849	332,323,195	23,571,575	32,228,407	17,491,809	12,708,016	8,680,483	43,619,368	7,065,463
1854	557,397,779	44,350,330	55,516,085	22,367,472	22,659,066	25,579,253	59,410,253	7,589,830
1859	657,183,799	63,502,449	78,244,987	25,976,497	18,858,289	26,808,822	104,537,818	8,323,041
1863	648,601,863	180,508,260	96,934,452	31,880,495	58,164,328	46,171,518	101,227,369	22,003,443

III.—The War Period and the National Banking System

When the War of the Rebellion began, the paper in circulation in the country was about $200,000,000—about three fourths among the loyal states. The specie available was estimated at $275,000,000. The opinion was that the war would be short. In 1862, Congress authorized the issue of $150,000,000 in notes, of which $50,000,000 was for withdrawal of the demand notes. This was the famous Legal Tender Act. The notes were legal tender except for imposts on duties and interest on the public debt. The friends of these "greenbacks" claim that it was this limitation which caused them to depreciate; but we are here only concerned with the fact and its bearing on the banking system. (See Currency.) Whatever be the reason, they did depreciate. Albert Gallatin, in a famous proposition, advocated a prohibitory tax on existing bank-notes and the establishment of a currency founded on public stock, or possibly mortgages on real estate. John J. Knox, in his excellent review of the national banking system, ascribes the first suggestion of its underlying principles to an unknown writer in *The Analectic Magazine*, who, in 1815, a period of utter demoralization in our currency, advocated a system in which public funds were to serve as the basis, support, and limit of American money. But there was a formidable opposition to every description of banks of issue inherited from the experience of reckless banking. It was finally favored only under pressure of war necessity. Secretary Chase, in his first annual report (1861), discust the advantages of a national banking system substantially as finally adopted. But the country was not ready.

In December of 1862, Secretary Chase again urged upon Congress the advantages of a national banking system, and reiterated the danger of United States notes. Meanwhile, the sentiment in and out of Congress had rapidly changed in favor of the proposition, and on Feb. 25, 1863, a bill, recommended by Senator Sherman and favorably reported by the Finance Committee of the upper House became law. The vote taken in the Senate Feb. 12 stood 23 to 21; that of the House, taken Feb. 20, 78 to 64, the president signing five days later.

Present National Banking System

It is needless to remark, in view of the immense personal financial interests involved and the prejudices to be overcome, that the discussion of the bill was decidedly warm. The ablest arguments for and against were those made in the upper House by Senators Sherman and Collamer, the latter of Vermont. By this law any association of five or more persons was authorized upon deposit of registered or coupon bonds to the minimum amount of $50,000 to receive 90 per cent of the par value of the same in bank-notes, which, being properly signed, were receivable for all government dues, except duties on imports, and were payable on all government debts, except interest on bonds. In compensation for the issue privilege, banks organized under this act were required to pay a tax on circulation, the rate being fixed at 1 per cent by amendatory legislation in 1864. Each association was required to conform to the law of its own state in the matter of interest rates, and was compelled to maintain a special reserve for its notes and deposits, and to redeem circulation at the place of issue.

The amount of circulation was fixed at $300,000,000, to be distributed throughout the states, territories, and District of Columbia, one half in proportion to the population, the remaining half in proportion to banking capital and business needs. The law provided for the establishment of a finance bureau, at the head of which was to be an officer called the Controller of the Currency, who was given general oversight of the entire system. The original bill has been repeatedly amended, yet its leading features, with certain important exceptions, remain valid to-day; the principal changes being made the next year, providing for redemption in certain specified leading cities,

Working Method

excluding coupon bonds from the list of securities, increasing the minimum of capital from $50,000 to $100,000, and providing for the easy conversion of state banks.

The bill had received the president's approval Feb. 25, 1863, but it was nearly four months then before a bank was organized under it, and five before one was opened in the city of New York. Up to Dec. 10, 1863, only 134 had been incorporated, and up to Nov. 25, 1864, only 584, of which 168 were state banks, reorganized under the national law. It is obvious that up to this time the state banks had continued to supply the major part of the currency of the country.

Mr. Fessenden had now become the Secretary of the Treasury, and Mr. McCulloch Controller of the Currency, and they agreed in opinion that the time had come when it was necessary to discriminate against the state banks in some manner if the good to be hoped from the national system was to be realized. State-bank systems were antagonistic to the national system, and they should not be suffered to exist unchecked and uncontrolled. It was indispensable to the financial success of the treasury that the currency of the country should be under the control of the government, and this could not be the case so long as state institutions had the right to flood the country with their issues. So thought these officers; and under their recommendation Congress was induced to pass an act, approved March 3, 1865, which provided, "That every national banking association, state bank, or state banking association, shall pay a tax of 10 per centum on the amount of the notes of any state bank or state banking association paid out by them after the first day of July, 1866." This act has in substance been continued to this day, and is now in force. Under and in consequence of it state banks of issue have ceased to exist.

Until recently, the country has had a period of changes in the currency rather than in banks or banking. (See CURRENCY.) The failure of the important house of Jay Cooke & Co. in 1873 precipitated a crisis, but the holders of national bank-notes were protected by the treasury deposits. (See CRISES.)

More recently, owing to the silver question (see SILVER), there has been something of a serious agitation for the abolition of the tax on state banks. On the more recent enormous development of banking, we quote, in condensed form, an article in *The Independent* (1906), from Mr. Sereno S. Pratt (editor of *The Wall Street Journal*): "The banking power of the world is estimated at $33,608,000,000, of which 41 per cent is in the United States. The increase in this country is computed by the Controller of the Currency as having been 168 per cent in fourteen years, against 82 per cent in foreign countries. At this rate it will not be long before the United States will contain a larger banking power than all the other nations put together.

Recent Development

"The total bank deposits in the United States in 1904 were $10,110,000,000, as compared with $4,535,000,000 in 1893, an increase of 123 per cent. In the same year the total amount of actual money in the United States was $2,803,500,000, of which $1,982,000,000 were in upward of 15,000 banks; so that there were over three dollars of deposits to every dollar of money in the country and over ten dollars of deposits to every dollar of money in the banks. In this calculation the savings-banks are included, altho they are institutions of safe-keeping and investment and not of discount. . . .

The recent growth of banking in this country presents these striking features:

(1) The extraordinary expansion of the trust-company business; (2) the growth of the national-bank system, especially in the small towns of the agricultural districts; (3) a notable development of banking power in the West; (4) the banking concentration which has gone on in the principal cities; (5) the interownership or alliance of banks and trust companies, making what are sometimes called "chains" of banking institutions (see CONCENTRATION OF WEALTH); (6) an eager and wasteful competition for deposits; and (7) the introduction of "department-store" methods in banking, many banks and trust companies.

This enormous growth of banking, and especially its concentration, has called general attention to it. The bankers themselves are eagerly discussing important questions. Some of these are: Shall the national bank-note circulation be made more "elastic"? President Roosevelt and Secretary Shaw say that it should. Shall the trust companies, which have grown so rapidly in number, deposits, and power, be compelled to keep larger cash reserves? Secretary Shaw, in his annual report, recommends that the trust companies of large capitalization be permitted to take out federal incorporations. Shall the banks themselves keep stronger reserves or make provision for more elastic reserves by gathering larger amounts of cash in July and August for use in the crop-moving periods? Shall the payment of interest, on deposits subject to withdrawal by check, be prohibited or materially reduced? What provisions should be made for a larger banking publicity?

"Ten years ago there were only 569 trust companies. There are now 1,115. During this time their resources have more than doubled, and they now amount to $3,802,000,000, or more than 27 per cent of the entire banking power of the country. Their deposits amount to $2,847,000,000, as compared with $4,735,000,000 in the national banks. Over $1,000,000,000 of the total trust-company deposits are in greater New York, where their competition with the banks constitutes one of the problems of the situation. The banking system, however, has grown, tho not so fast as the trust companies.

"The national-bank expansion has been especially notable since 1900, when, by the Act of March 14th, national banks could be incorporated with a minimum capital of $25,000. This has led to the organization of 2,666 national banks, or practically one third of the total number chartered since the national banking system was established. Of the total $4,735,000,000 of national-bank deposits on Aug. 25th, $2,117,000,000 were in the country banks. Secretary Wilson says: 'One of the most notable outgrowths of savings by farmers is the very great multiplication of small national banks in recent years." There is in New York, Chicago, and St. Louis $1,342,000,000 of national-bank deposits, while in thirty-five other banking centers there is $1,275,000,000, and in the rest of the country $2,117,000,000. Twenty-one per cent of the deposits are in New York City, but Chicago and Philadelphia hold over $200,000,000; three other cities—Boston, Pittsburg, and St. Louis—hold over $100,000,000; and four others—Kansas City, Cincinnati, Cleveland, and Baltimore—over $50,000,000.

"The resources of the national banks of the United States are greater than the capital of all the railroads of the country. Their outstanding loans are larger than the public debt of Great Britain, Russia, Germany, Italy, or Spain. They hold in securities 2 per cent of all the stocks and bonds admitted on the New York Stock Exchange. They hold in actual money 66 per cent of all the money in all of the banking institutions, public and private, in the United States. Their circulating notes, amounting to $533,000,000, are 20 per cent of all the money in circulation in the United States

Concentration of Banking Power

"There has at the same time been a remarkable concentration, which has been accompanied by a close alliance between the big banks and groups of trust and insurance companies. In New York there are fewer banks but larger increased banking resources than ten years ago.

"A recent compilation showed that there are 149 national banks in the United States having gross deposits of $5,000,000, or more. There are 28 banks having deposits of over $22,000,000. These include 14 in New York, 4 in Chicago, 4 in Philadelphia, 2 in Boston, 2 in St. Louis, and 1 each in Pittsburg and Kansas City.

"In New York the National City, the National Bank of Commerce, the First National Bank, the National Park Bank, and the Hanover National Bank take the lead, their combined deposits making a total of $662,000,000. This is indeed immense, and yet there are 5 banks in Great Britain (not counting the Bank of England) whose total deposits and current accounts make the imposing total of $1,060,000,000. Yet the total deposits of all the joint-stock banks in Great Britain, this time including the Bank of England, is over $1,000,000,000 less than those of the national banks of the United States.

"In Chicago there is one bank, the First National, having deposits of $95,000,000, which ranks with the first five banks in the country.

"Not a few trust companies have also attained great size. In 1905 there were 29 trust companies, 14 of them outside of New York, having assets in excess of $23,000,000. There are 5 trust companies in New York having combined deposits of $280,000,000, comparing with $662,000,000 in the five largest banks. *The London Economist* recently observed that concentration there had been checked for the time being. Just now this is the case in New York, but the tendency is irresistible, and it will again begin to show its power."

The more radical criticism of the banks varies from criticism of the national system to attacks upon banking altogether. It is argued that a state-bank issue would be less free from danger at the hands of agitators, since, if they did get control of the legislation of one state, they would not be likely to of all state legislations at the same time; and so the whole national system would not be endangered as if all were under the control of one national body. There are those who would do away altogether with the chartering of private banks by either state or nation as banks of issue. These argue that the present system gives enormous advantages to the favored few who have capital. They point out that under the present system any five rich men can loan the government $100,000, receive interest on the same without any serious risk to themselves, and yet, while receiving this interest on the whole $100,000, can get $90,000 of this to let out again at interest as a bank. They go on to argue that our whole banking and currency system since the war, if not before, has been controlled by the bankers of our great cities wholly in their own interests. They accuse them of first scheming to put limitations upon the government issue so as to lessen its value, thus causing depreciation; secondly, of buying up this depreciated currency, and with it purchasing United States bonds at par, and then getting Congress to vote, under the pretense that honesty demanded it, the redemption of these bonds in gold (having sold them for paper); and, thirdly, on top of all this, of scheming to reduce the volume of the currency, and so to raise the value of the notes in their possession. The People's Party, therefore, all Socialists, Nationalists, Greenbackers, Knights of Labor, and many even who do not indorse Greenbackism would have all banking carried on directly by the government, without the intervention of private banks chartered by either state or nation as banks of issue. Prof. Amasa Walker, Francis Bowen, and other economists oppose such private banks. (See Currency; Greenbacks; Paper Money; People's Party.) Philosophical anarchists and extreme individualists, on the other hand, would abolish the present system by putting no dependence upon government, but substituting mutual banks. (See Mutual Banks.) Others, who do not go so far as either of the above extremes, would have simply a government postal-bank system or land banks, as in Germany. (See Land Banks.)

Radical Views

IV.—Latest Statistics

World's Banking Power, 1905

Classification	1890	1905	Increase over 1890	
			Amount	Per Cent
	Millions	*Millions*	*Millions*	
Banking power of the U. S.	$5,150.0	$15,333.9	$10,183.9	197.7
Banking power of foreign countries.	10,835.0	19,158.5	8,323.5	76.8
Banking power of the world	$15,985.0	$34,492.4	$18,507.4	115.8

The banking power of the U. S., including the island possessions, consisting of capital, surplus, other undivided profits, deposits and circulation, is shown to be $15,333,865,561. These figures include funds of the national banks, amounting to $5,711,271,024; reporting state banks and bankers, $9,062,923,037; and non-reporting banks, estimated, $559,671,500.

The world's banking power in 1890 was estimated by Mulhall at $15,985,000,000, the U. S. being credited with something less than one third of that amount. The present estimate, compared with that of 1890, shows that the banking power of the U. S. has increased since that date to the extent of $10,183,900,000, or 197.7 per cent; that of the foreign countries, $8,323,500,000, or 76.8 per cent; and the combined banking power, $18,507,400,000, or 115.8 per cent.

It will be noted from the table on page 97 that the Southern States show the largest percentage of increase in deposits during the period from June 30, 1896, to June 30, 1905, the percentage of increase in this section being 246.1, followed by the Western States, where the ratio of increase is 234.6; and, in the order named, the Middle Western States with 180.3, the Pacific States 171.6, the Eastern States 129.2, and the New England States 50.1. The average of increase for the United States is 129.2 per cent.

The average individual deposit in the U. S. per capita of population has steadily risen from $69 in 1896 to $95 in 1900, $122 in 1904, and $136 in 1905. The volume of exchanges of the 103 clearing-houses in the U. S. amounted to $140,501,841,957, as against $102,356,435,047 for the year ended Sept. 30, 1904, an increase of $38,145,406,910 and the largest gain in any year since these statistics have been published. The general prosperity of the country and confidence in the stability of business credits are evidenced in the volume of clearings effected during the current year.

BANKS, LOUIS ALBERT: American clergyman; born at Cornwallis, Ore., 1855; educated in the public schools and at Philomath College of that state. In 1883 he was ordained an elder in the Oregon Conference of the M. E. Church, and has since served pastorates at Portland, Ore., Boise City, Ida., Vancouver and Seattle, Wash., and Cincinnati, O. Since 1886 he has been a pastor in the East where he has had prominent charges, and is now (1907) evangelist of the American Anti-Saloon League. In Vancouver he edited *The Pacific Censor*, state organ of the Washington Temperance Alliance, and so enraged the liquor dealers that in June of 1880 he was shot down on the streets by one of their agents. For two months he preached, reclining across chairs, to eager crowds. At the State Convention of Massachusetts Prohibitionists, held Sept. 8, 1893, he was nominated governor. A voluminous writer on religious and other themes, his main sociological works are "The People's Christ" (1891), and "The White Slaves" (1892), a study of Boston sweat-shops. *Address*: Nyack, N. Y.

BAPTISTS IN RELATION TO SOCIAL REFORM: In reviewing the relation of Baptists to social reforms, it is to be borne in mind that they do not constitute an organic body capable of giving a united authoritative expression of opinion on either social or religious matters, or of taking formal and concerted action thereon. While exhibiting a remarkable unity of doctrine and polity, they are, nevertheless, simply local societies, self-governing, and independent of one another. Indeed, to the sociologist this initial statement is one of deep interest, as these local societies were, in the times of the reformatory movements of the sixteenth century, already existing as free socialistic communities, and as such are deserving of the investigation of the social reformer. Mr. Richard Heath, in an article in *The Contemporary Review*, has clearly shown this fact. These societies have never completely lost the early social leaven, and in all times there have been among them earnest and able advocates of social, political, and religious liberty, contending for the separation of Church and State, liberty of conscience, government by consent of the governed, the kingdom of God on earth, and the inner light and teaching of the Divine Spirit. Baptists have, therefore, naturally affiliated themselves with the radical party in social and religious affairs. And yet this same love of individual liberty and a jealousy of autocratic external control have prevented the manifestation of this progressive spirit in the erection of great institutions or the promulgation of authoritative creeds. Perhaps, aside from individual expressions of this liberty-loving spirit, the widest influence which Baptists have exerted has been in a socialistic and missionary propaganda. Missionary zeal has ever been conspicuous among them both in home and foreign lands. In the modern missionary movement, William Carey and Adoniram Judson are conceded to rank among the foremost pioneers. In political revolutions they have been usually found on the liberal side, and many of the leaders have been drawn from among them. In the antislavery movement they took an early and decisive position, while in the Revolution they were, almost to a man, on the patriot side; and in a still earlier day Roger Williams was the first great apostle of religious liberty.

Missionary and Socialistic Propaganda

The recent social discussions have naturally awakened the interest of Baptists. In the Baptist Congress reports, almost from its commencement, in 1882, a prominent place has been accorded to social topics, and able contributions will be found in them to the solution of these questions. In the proceedings of the missionary annual meetings, which are the only general gatherings of Baptists of a national character, as well as in state conventions and local associations, social opinions of an advanced type on temperance, slavery, negro and Indian education, etc., have found expression in resolutions and memorials intended for transmission to Congress or state legislatures.

The Baptist Congress was instituted in Nov., 1882, by several clergymen and laymen "for the discussion of current questions," and has proved a very useful and efficient organization. Its inception is credited to Prof. E. H. Johnson, D.D., of Crozier Theological Seminary, Upland, Pa.

In 1889 a few of the younger Baptist ministers in the vicinity of New York commenced a paper called *For the Right*, devoted to Christian Socialism. It was published for eighteen months, and then discontinued for lack of financial support. The first editors of this paper were Rev. J. E. Raymond, Rev. Walter Rauschenbusch, Miss Elizabeth Post, and Rev. Leighton Williams. In Dec., 1892, a conference of Baptist ministers interested in social topics met in Philadelphia and formed an undenominational society known as the Brotherhood of the Kingdom, to be devoted to the study and propaganda of the social teachings and gospel of Jesus Christ. In August, 1893, the Brotherhood held a three days' conference at Marlborough-on-the-Hudson, discussing various aspects of the doctrine of the Kingdom of God, with a view to the publication of a volume of essays on the subject. Smiliar conferences have been held yearly since. (See Brotherhood of the Kingdom.)

Perhaps the considerations already stated may explain the small number of Baptist churches which have as yet sought to exemplify the social aspects of the Gospel in the various appliances and applications now becoming common. Yet the "institutional Church," as it is coming to be called, is by no means unknown among Baptists. Mention should be made also in this article of the advanced stand which many of the Baptist preachers and authors have taken on social topics. Dr. Francis Wayland and Dr. Martin B. Anderson, exerted as educators a profound influence during the antislavery agitation and the Civil War, as did also Dr. William R. Williams by his sermons. In conclusion, it may

"Institutional Churches"

be said that as yet the relation of Baptists to social reform is not so important for any distinct contribution that they have made to its literature or to its institutions as for the illustration which their own historical descent and present condition affords of the possibility, permanence, and prosperity of self-governing, self-perpetuating social communities. They early built upon principles in the religious sphere which have since been embodied in our political constitution, and are yet to be realized in a new social régime.

LEIGHTON WILLIAMS.

BARKER, WHARTON: Banker and reformer; born in Philadelphia, Pa., 1846; was graduated from the University of Pennsylvania in 1866. The firm of Barker Bros. & Co. in 1878 acted as the financial agent of the Russian Government for the building of four cruisers. In 1879 he advised regarding the development of certain mines in Russia; and in 1887 he obtained valuable concessions in China. Barker remained a Republican until 1896, tho (since 1880) opposing the moneyed aristocracy. In 1896 he became a Populist, and in 1900 was presidential candidate of the antifusion Populists. He has written on the money question from the Populist standpoint, and in 1869 founded *The Penn Monthly* which, in 1880, was merged with *The American*, discontinued in 1905.

For the last six years Mr. Barker has urged the organization of a new party, to be called the Commonweal Party, and has striven to impress his views upon leaders among the wage-earning and salaried classes and among the farmers. He believes that the conflict between the people and the plutocrats will be fought on a platform of human rights versus property rights, for national money against bank money, for national railroads against private railroads, for a protective system that will protect the body of the people and destroy the trusts, and for direct taxation which will tax property and not persons. He stands for a foreign policy that will confine American activity to the American continent, and for an economic policy which, under commercial union, will extend free trade in America and set up a barrier against European and Asiatic complications. *Address*: 608 Chestnut Street, Philadelphia, Pa.

BARNARDO, THOMAS JOHN, AND THE BARNARDO HOMES: Founder of institutions in the United Kingdom and the colonies, by which over 60,000 orphans have been cared for, and over 17,000 emigrated to Canada or other British colonies. Dr. Barnardo was born in Ireland, 1845. Educated in parish schools and hospitals in London, Edinburgh, and Paris. Becoming interested in children he boarded out a group of children in 1866; established his first home, 1867, on Commercial Road; a village for girls with about fifty-two cottages at Ilford, 1873; Her Majesty's Hospital for Sick Waifs, 1873. Over 100 homes or branches have developed from this beginning, including an immigration depot in Ontario, and an industrial farm in Manitoba. Author, among other writings, of "Something Attempted, Something Done," and "The Rescue of the Waif." Died, 1905.

BARNES, G. MAHLON: National secretary of the Socialist party; born at Lancaster, Pa., 1866; attended Soldiers' Orphan School at Mount Joy; learned the trade of cigarmaking; and in 1887 removed to Philadelphia. He has been five times elected secretary of the local Cigar Makers' Union, resigning the office at the end of each term and returning to the work of his trade. He has also been repeatedly elected to conventions of the Cigar Makers' International Union and of the American Federation of Labor. In 1905 he was elected national secretary of the American Socialist party. *Address*: 269 Dearborn Street, Chicago, Ill.

BARNES, GEORGE NICOLL: Labor member of Parliament; born at Lochee, near Dundee, Scotland, 1859. He was the son of a jute-mill employee, and was at an early age apprenticed to a Dundee engineer. Later he went to Barrow and to London, but subsequently secured work at Woolwich Arsenal, Millwall, Poplar, and Chelsea, having previously joined the union of his trade. A vacancy occurring in the council of the union by the retirement of John Burns, Barnes was elected in his place. From 1892 to 1895 he was assistant secretary of the Amalgamated Society of Engineers, and in 1896 was elected general secretary; he was prominent in the great lockout of 1897. In 1906 he was elected to Parliament from the election district of Blackfriars, Glasgow, and endorsed by the Labor Representative Committee. *Address*: 110 Peckham Road, S. E., London, England.

BARNETT, SAMUEL AUGUSTUS: Warden of Toynbee Hall, London; Canon of Bristol; born in Bristol, 1844; educated at Wadham College, Oxford. About 1872 he became vicar of St. Jude's Church, Whitechapel. In 1883 he presented to a small group of students, gathered in a room at Oxford, a plan for a settlement of university men to live and work among the poor. A small settlement of five men was made. Cambridge University joined with them, and in Jan., 1885, TOYNBEE HALL was founded with Mr. Barnett as warden. It was named for Arnold TOYNBEE. Mr. Barnett's central thought was that all true uplifting for the poor must come from life and from brother life. He and his wife, Henrietta O. Barnett, have been the authors of many essays and papers on various portions of the social problem, collected into a volume entitled "Practicable Socialism." Some of his more fundamental positions are as follows:

> The social reformer must go alongside the Christian missionary, if he be not himself the Christian missionary.
>
> The one satisfactory method of social reform is that which tends to make more common the good things which wealth has gained for the few. The nationalization of luxury must be the object of social reformers.
>
> The first practical work is to rouse the town councils to the sense of their powers; to make them feel that their reason of being is not political, but social; that their duty is not to protect the pockets of the rich, but to save the people. The care of the people is the care of the community and not of any philanthropic section.
>
> Societies which absorb much wealth and which relieve their subscribers of their responsibility are failing; it remains only to adopt the principle of the education act, of the poor law, and of other socialistic legislation, and call on society to do what societies fail to do.

Mr. Barnett's social efforts are not confined to Toynbee Hall. As a member of the Whitechapel Board of Guardians he has taken great interest in the reform of poor-law administration. He is also chairman of the Children's Country Holiday Fund; has aided very materially in the establishment of the Free Library in Whitechapel; and is one of the commissioners for that part of London.

He is also actively connected with the Metropolitan Association for Befriending Young Servants, with the Charity Organization Society, the School Board, the Teachers' University Association, and the London Society for the Extension of University Teaching. *Address*: Toynbee Hall, Whitechapel, E. London, England.

BARROWS, SAMUEL JUNE: Prison Commissioner and author; born in New York City, 1845; began work at the age of nine; received his elementary education in the night schools; studied stenography; was employed on the New York *Sun*, *The World*, and *The Tribune*; in 1868 became stenographic secretary to William H. Seward, Secretary of State; was graduated from the Harvard Divinity School in 1874 (B.D.). During the summers of 1873 and 1874 he was with General Custer on the Yellowstone, and in the Black Hills as correspondent to the New York *Tribune*. From 1874 to 1875 he studied at Leipsic, and in 1876 became pastor of the First Unitarian Church, Dorchester, Mass. From 1881 to 1897 he was editor of *The Christian Register*. In 1897 he was elected to Congress from the tenth district of Boston. He is one of the founders of the Massachusetts Prison Association, and helped to develop the probation system. In 1896 he was appointed by President Cleveland Commissioner for the U. S. on the International Prison Commission, and represented the U. S. at prison congresses in Paris, Brussels, and Budapest. He is chosen to be president of the next International Congress. Barrows is corresponding secretary for the Prison Association of New York and a member of the Commission on Probation and of the Commission on New Prisons. He has been a Republican in national politics, and an Independent in municipal politics, and believes that social reform must be obtained not through paternalism but fraternalism, evolution rather than revolution. Logic of democracy means no discrimination to race, sex, and creed, and better distribution of privilege. Democracy's problem is to secure the greatest privilege for the many without restricting the privilege of the individual. Author: "Shaybacks in Camp"; "Crimes and Misdemeanors in the United States"; "A Baptist Meeting House"; "The Doom of the Majority of Mankind." *Address*: 135 East Fifteenth Street, New York City.

BARTON, MISS CLARA: Founder of the Red Cross Society in the United States; born in Oxford, Mass., 1821; educated at home and in the public schools. At the age of fifteen she began teaching, continuing until her twenty-fifth year, when she took the graduating course at the Clinton Liberal Institute, N. Y. A pioneer in the public-school system, she opened the first public school at Bordentown, N. J., with six pupils; the school soon had 600 pupils. Afterward she became a clerk in the U. S. Patent Office, and was the first woman in any department to draw a salary over her own signature. During the Civil War she was active in the field, distributing provisions, clothing, and medicine sent for the relief of the soldiers. In 1865, by authority of President Lincoln, she instituted a search for missing men of the army, and succeeded in tracing 20,000 of the soldiers. At the request of afflicted people, she went about the country giving war lectures.

At the outbreak of the Franco-Prussian War Miss Barton was associated with the International Red Cross Society of Geneva, and was present at most of the great battles, doing splendid service. She returned to America in 1873. After five years' effort she obtained recognition of the Red Cross Society from the U. S. Government, and became first president of the U. S. society. In 1904, when the society passed under government control, she resigned her presidency, whereupon she organized and was chosen first president of the National First Aid Association of America. Miss Barton is an earnest advocate of all useful reforms: Suffrage, temperance, social purity, equal pay for equal service, etc. Author: "History of the Red Cross" (1882); "History of the Red Cross in Peace and War" (1898); "Story of the Red Cross" (1904); besides many pamphlets, reports, etc. *Address*: Glen Echo, Md.

BASCOM, JOHN: American author and educator; born in Genoa, N. Y., 1827; was graduated from Williams College, 1849, and Andover Theological Seminary, 1855. From 1852 to 1853 he was tutor and from 1855 to 1874 professor of rhetoric at Williams College; from 1874 to 1887 president of Wisconsin University and professor of mental and moral philosophy; and from 1891 to 1901 professor of political science at Williams College. He has written extensively for the periodical press on prohibition, labor reform, etc. His main works are: "Political Economy," "Æsthetics," "Science of Mind," "Philosophy of Religions," "Philosophy of English Literature," "Ethics," "Natural Theology," "Comparative Psychology," "Sociology," "Words of Christ," "New Theology," "Social Theory," and "Growth of Nationality in U. S." *Address*: Williamstown, Mass.

BASLY, EMILE JOSEPH: French deputy; born at Valenciennes in 1854. Left an orphan and cared for in an asylum, he became a miner. In 1880 he organized a union at Angin, and became its general secretary. In 1884 he was active in a long strike. In 1885 he was elected to the chamber of deputies on a Socialist platform, and has been repeatedly reelected. During the strike in Decazeville in 1885 he explained the murder of one of the subdirectors as an act of popular justice. In 1887 he joined the group of republican-socialistic deputies; and in 1889 was a delegate at the International Labor Congress in Paris. Since 1900 he has been mayor and town councilor of Lens.

BASTIAT, FRÉDÉRIC: Political economist; born at Mugron, near Bayonne, France, in 1801. His father was a merchant in the Spanish trade, and he was left an orphan at the age of nine. He commenced active life in the establishment of his uncle; then tried farming at Mugron; and after the Revolution of 1830 was made justice of the peace of his canton. His first pamphlets were memoirs on local subjects; but he became interested in English writing on political economy, and it seems to have awakened him to new powers. His "Sophismes Économiques" gained him popularity and recognition. He soon became a dreaded foe of protection, and a friend of Cobden. An *Association pour la Liberté des Échanges* was formed at Bordeaux and another at Paris, with Bastiat as secretary. After the Revolution of 1848, he turned his shafts of wit and epigram against the Socialists, and even more against Proudhon. Elected to the Assembly of 1848–49, he spoke little, being mainly engaged on his great

work, "Harmonies," the first volume of which only was published before he died in Italy in 1850. "In this brilliant work," says Palgrave's "Dictionary of Political Economy," "unhappily never finished, Bastiat shows the contrast between the internal weakness of the artificial organizations which are founded on constraint, and the prosperity spontaneously arising in an economic condition in which the equilibrium of individual and collective forces results from their free and reciprocal balance." (See Palgrave's *Dictionary of Political Economy.*)

BATHS, PUBLIC: Public baths have existed from the beginnings of civilized society. Reasons partly climatic and partly religious led to their early development in Egypt and in all Oriental countries. Baths were connected with the gymnasia of Greece, and were developed into especially great splendor and size in imperial Rome. Such ruins as those of the baths of Caracalla show what an enormous size these establishments must have had. In reality, however, they were club-houses as well as baths, and included libraries, lecture-rooms, banquet-halls, dance-halls, gymnasia, porticoes, gardens, racetracks, and every device for luxury and amusement. In the fourth century there are said to have been 800 baths in Rome, and they were copied in every Roman city and province. In the Middle Ages almost every village had its public bath, as is true to-day in Russia, Turkey, and Japan. In Tokyo there are said to be 1,000 public baths. Modern public baths began in Germany, tho Liverpool in 1892 erected the first public bath-house. In 1896 Parliament passed an act, permitting municipal and local authorities to establish public baths and laundries. Birmingham was the first city to do this, but to-day such establishments are found in almost every English city of any size. On the Continent they are not so numerous, yet to be found in all the larger cities.

United States

In the United States, the results of an extensive investigation conducted by the Federal Bureau of Labor showed the lack of facilities for bathing in the congested slum districts of Baltimore, Chicago, New York, and Philadelphia. The entire number of persons reported living in the selected districts on April 1, 1893, the date of the investigation, was as follows: Baltimore, 18,048; Chicago, 19,748; New York, 28,996; and Philadelphia, 17,060. It is explained in the report that the districts selected contain but a portion of the whole slum population of the cities included in the investigation, but were among the worst in these cities—the centers of the slum population.

The following table shows the number and percentage of families and individuals in houses or tenements having and not having bathrooms:

Since that date large progress has been made. A report of the bureau, prepared for the exhibit at St. Louis of 1904, finds that in 34 cities of the United States more or less adequate provision for public baths has been made by the municipality. Other cities are carefully considering the establishment of houses, and in some cases, notably in St. Louis, appropriations have been made for the purpose. The report describes and tabulates 88 municipal public baths and 11 non-municipal.

The municipal baths in existence may be classified in a general way into five types: The beach bath, the floating bath, the pool bath, the shower-bath, and the combined shower and pool bath. The beach and the floating baths may be said to represent the earliest type of bath, while the shower-bath represents the latest development in this direction.

Beach baths with the simplest of accommodations have been in existence for many years. The L Street Beach in Boston is, however, the oldest of them for which information could be secured, having been established in 1866. Boston now maintains 10 beach baths; Milwaukee, 4; Chicago, 3; Baltimore, 3; while 1 or 2 are found in Cleveland, Ohio; St. Paul and Minneapolis, Minn.; Cambridge, Mass.; Detroit, Mich., and Bridgeport, Conn.

Floating baths were established by the city of Boston as early as 1866 and by the city of New York as early as 1870. Boston still maintains 12 of these houses, New York 15, and Brooklyn 5. One or two baths of this character are maintained also by Providence, R. I.; Hoboken, N. J.; Springfield, Taunton, Worcester, and Newton, Mass.; Hartford, Conn., and Washington, D. C.

Pool baths are of various kinds. The first established by any American city, as far as known, was constructed in 1885 by Philadelphia. That city was compelled to abolish its floating baths at that time owing to the pollution of the water, replacing them with pools in various parts of the city. It now has in operation 15 pool baths. Chicago has 2 elaborate baths of this character, while similar ones are found in Holyoke (4) and Boston (1), Mass.; Newark, N. J. (3); Utica, N. Y. (1); and Kansas City, Mo. (1).

The three kinds of baths just mentioned, it will be noted, are available only in the warm season—perhaps four months in the year. While they are excellent as affording recreation and facilities for securing a degree of cleanliness, it is apparent that the best results cannot be secured thereby. Hot water is essential not only to a thorough cleansing of the body, but also to render possible the giving of baths during the season when baths are most needed and when the facilities for bathing are most lacking. The tub bath, while serving a useful purpose under certain circumstances, has now been almost entirely abandoned in public baths. It is now very generally conceded that the shower or rain bath is best adapted for all public purposes. As has been stated, these baths have been in use for many years in many of the public baths in Great Britain and the Continent of Europe. Their general establishment by municipalities in this country, however, began about ten years ago. Baths of this character were, indeed, established by private philanthropic enterprise some years pre-

City	Population of Houses or Tenements having Bathrooms				Population of Houses or Tenements not having Bathrooms			
	Number		Per cent		Number		Per cent	
	Families	Individuals	Families	Individuals	Families	Individuals	Families	Individuals
Baltimore	296	1,663	7.35	9.21	3,732	16,385	92.65	90.79
Chicago	110	748	2.83	3.79	3,771	19,000	97.17	96.21
New York	138	1,888	2.33	6.51	5,774	27,108	97.67	93.49
Philadelphia	560	3,080	16.90	18.05	2,753	13,980	83.10	81.95

viously through the efforts of Dr. M. Morris and others, and had been introduced in the Charlesbank gymnasium baths by the city of Boston as early as 1889. If the two modern types of baths, consisting of showers alone, or showers in connection with a pool, are considered together, it is seen that Milwaukee established the West Side Natatorium in 1890, Chicago opened the Carter H. Harrison Bath in 1894, while other cities followed their example during the succeeding years. At the present time 39 baths of these types are in operation by various cities in the United States, and many more are under construction. Of the houses devoted especially to the furnishing of shower baths, Boston, Mass., maintains 10; Chicago, Ill., 7; New York, N. Y., 3; Brooklyn, N. Y., 2; Baltimore, Md., 2; Buffalo, N. Y., 2; Yonkers, N. Y., 2; while 1 each is maintained by Rochester and Troy, N. Y.; Cleveland, Ohio; Louisville, Ky., and Portland, Me. Of the houses containing a pool in addition to the shower equipment, Milwaukee maintains 3 and Brookline, Mass., and Syracuse and Albany, N. Y., each 1. New York and Brooklyn recently opened elaborate bath-houses in which the equipment consists almost entirely of showers. These cities have also planned a number of additional houses, one of which will contain a pool of tempered water in addition to the shower equipment.

The costs of the baths range from $461,000 (site $331,000) for a bath now being built in Boston, to $500 for one in Chicago (for building and equipment only on public land).

The exceedingly small cost of maintenance per bath is clearly shown. This cost ranges from one fourth of a cent in the fifteen municipal pool baths of Philadelphia to three or four cents in the indoor shower-baths in the larger cities. In a few of the smaller cities the cost runs considerably higher, this being due probably to the small number of bathers as compared with the size and equipment of the houses.

As regards the policy of furnishing baths entirely free of expense to bathers it is seen that at the floating baths in 9 cities no fee is charged for their use, while small fees are charged at such baths in 3 cities. In 3 cities all beach baths under the direct control of the municipalities are entirely free, while in 8 cities a small charge is made for the use of bathing-suits, etc. In 3 cities all pool baths are entirely free, while in 4 a small fee is charged. In 9 cities free shower-baths are found, while in 4 a charge is made. In 1 city the combination shower and pool baths are entirely free, while in 3 cities the privilege is contingent upon a small fee.

In considering the figures showing cost of maintenance per bath it should be remembered that in nearly all baths in which a fee is charged certain days or hours are usually set apart, during which baths are given free of charge.

A most interesting development of the public-bath movement has been the introduction of shower-baths in the public schools in a number of cities.

In certain cities a direct connection between the bath and the school is encouraged by locating the public bath near the school.

Swimming instruction during vacation is a feature of the floating, beach, and pool baths of New York, Brooklyn, and a number of other cities, while all indoor baths which maintain a tempered pool all the year, without exception, provide for instruction of this character during the entire year.

The public laundry is a feature connected with a number of the public municipal baths. The municipal bath-houses of Baltimore, Chicago, Cleveland, and Troy contain well-appointed public laundries where women may take their soiled clothes and in a comparatively short time accomplish the task of washing and ironing under the most desirable conditions. This feature has been a most unqualified success in all the institutions in which it exists, and is an especial boon to the poorer classes.

BAUER, STEPHEN: Secretary of the International Labor Bureau at Basel, Switzerland; born at Vienna, Austria, 1865; LL.D., Vienna, 1889; studied with traveling scholarship 1890 and 1891 in Paris and London; statistician of the Chamber of Commerce in Brünn, Moravia, 1892–99; lecturer from 1893 to 1899 at the Polytechnical High School of Brünn. In 1899 he held summer courses at the University of Chicago, and in the same year was appointed to the chair of political economy at Basel, which he still occupies. He was chief of the Swiss Census at Basel in 1900, and since 1901 has been chief of the International Labor Bureau. As the result of his experiences in Austrian, French, Swiss, and American factory towns, Dr. Bauer has advocated national labor laws, international understandings concerning such legislation, trade boards of arbitration, co-operation, industrial insurance, and municipal reforms. He believes in permanency of employment as necessary to the greater well-being of the workers, in greater leisure and the useful employment of that leisure, and in the generation of an atmosphere of freedom in which all good things would grow. Author: "Die Arbeiter der Brünner Maschinen-Industrie"; "Wages and Labor Policy in Australasia"; "Night-Work of Women"; "Dangerous Trades," etc., besides numerous articles on the history of political economy, etc. *Address*: Rebgasse 1, Basel, Switzerland.

BÄUMELER, JOSEPH: Head or leader of the Separatists, who in 1818 founded the communistic colony of ZOAR. Originally a weaver, and later a teacher, he seems to have been a man of unusual organizing ability, a fluent speaker and natural leader. The community was at first celibate, but between 1829 and 1830 they began to permit marriage, and Bäumeler himself took a wife. Under his lead the community prospered greatly, and when Bäumeler died in 1837 the loss was said to be almost irreparable to the community. (See ZOAR.)

BAX, ERNEST BELFORT: Author; Socialist; born at Leamington, England, 1854; educated privately, but later studied in Germany. In 1882 he joined the Social Democratic Federation, and in 1883–84 was on the Executive Council. In 1885, in consequence of a "split" in the original body, he founded, in conjunction with William Morris, the Socialist League. Later on, the league developing anarchist tendencies, he returned to the Social Democratic Federation, and has actively participated in the work of that body ever since, having been the federation's delegate at most of the international congresses. For a time he edited the party organ *Justice*, and during the Socialist League period, together with William Morris, he edited *The Commonweal*. Mr. Bax's socialism has its foundation in the doctrine of Marx, but he is prepared to criticize certain applications of the Marxian theory of historical determinism at present current. Author: "Ethics of Socialism," "Outlook from the New Standpoint," "The Problem of Reality," "German Society at the Close of the Middle Ages," etc. *Address*: Middle Temple, London, England.

BAZARD, SAINT-AMAND: Follower of St. Simon; born in Paris, 1791; won the Cross of the Legion of Honor for the part he took in the defense of Paris (1813). He had a good position in the Prefecture of the Seine, but becoming interested in the efforts for democratic freedom, he went to the south of France and took part in the activity of the Carbonari. Returning to Paris, he joined the Saint Simonian School, and became its leading economist and editor of its journals, the *Producteur* and the *Globe*. He advocated compulsory free education, and the gratuitous giving by the State of land and capital for life tenancy *only* (so as to prevent accumulation), the State to give to each his deeds and to receive from each according to ability. In 1828 he gave, in Paris, a long course of lectures which largely made Saint Simonianism popular. In 1831 he opposed ENFANTIN, his colleague, at the head of the Saint Simonian school, on the question of marriage and divorce, and died in 1832 of a broken heart at the division of the school. His

main work is "Exposition de la Doctrine de Saint Simon."

BEBEL, FERDINAND AUGUST: Socialist; born 1840, near Cologne; educated as a turner; passed through the usual grades of apprenticeship and journeymanship, and after his *Wanderjahre*, spent in South Germany, established himself in 1860 at Leipsic. His first public activity was as an upholder of Schultze-Delitzsch's cooperative movement, to which Lasalle also at first adhered, and he became prominent in political and educational work among workingmen. He threw all his influence against Lasalle and the Universal Association when the latter was founded.

Prior to 1866 Bebel had no sympathy with socialism, but from that time his views rapidly changed. He joined the International, becoming influential enough to take a prominent part in bringing together the followers of Marx and Lasalle, thus helping to make the Social Democratic Party. When elected President of the Union of German Working Men's Associations in 1867, he persuaded the organization to unite with the International—at the time an important step in the movement toward socialism.

Bebel and Liebknecht became the leaders of social democracy in Germany in the elections of June, 1893, and continued so till the latter's death. Bebel still remains the most pronounced Socialist in the German Reichstag, to which he has been continuously elected, and the membership in which gives him the right to bitterly attack the government and to advocate socialism in brilliant speeches widely quoted throughout Germany. Bebel once summarized his views thus: "We aim in the domain of politics at republicanism, in the domain of economics at socialism, in the domain of what is to-day called religion at atheism." In 1872 he was sentenced to imprisonment for two years and nine months on a charge of lese-majesty, and has been repeatedly imprisoned since—for nine months in 1886. This, however, has only increased his popularity as the leader of German socialism. He has been elected from Glauchau-Meerane, Dresden, Strasburg, Hamburg, Saxony, and elsewhere. In 1868 he was connected with the *Volkstaat* at Leipsic, and since 1891 with the *Vorwärts* at Berlin. Main writings: "Unsere Ziele," 1869; "Deutscher Bauernkrieg," 1876; "Christentum und Sozialismus," 1883; "Die Frau und der Sozialismus," 1883 (later revised); "Die Sonntagsarbeit," 1888; "Für Volkswehr gegen Militarismus," 1898; and "Die Sozialdemokratie und das Allgemeine Wahlrecht," 1895. *Address*: Habsburgerstrasse 5, Berlin, Germany.

BECCARIA, CESARE BONESANO, MARQUIS OF: Italian political economist; born at Milan in 1738; educated at a Jesuit college at Parma. He was an able mathematician, an expert in many sciences, and belonged for twenty-five years to the magistracy, serving under the Austrians, who in 1768 formed for him a chair of political economy in Milan—the second of the kind in Italy. His famous little tract, "Dei delitti e delle pene," has been translated into twenty-two languages. Beccaria arrived at many of the conclusions of Adam Smith and of Malthus; and he is the author of the famous phrase, "The greatest happiness of the greatest number." He asserted that "coldly (rigidly) examining human nature, we see that every man is absolutely *egotistic*, and that on this basis alone legislation can be established if it is not to be knocked over constantly; that nobody cares anything for the universal happiness or for the good of others, and that every man makes himself the center of all the things that happen in the world." He died in 1793.

BECK, KARL JOSEPH: Swiss Christian Socialist; born at Sursee, Lucerne, 1858; was graduated from the University of Innsbruck (Th.D. 1885); from 1885 to 1888 vicar of the Roman Catholic community in Basel. He became active in socialism in 1888, and took part in the Labor movement instituted by the Swiss Workingmen's Association. From 1888 to 1891 he was professor of exegesis, ethics, and pastoral theology at the Theological Seminary in Lucerne; and since then he has held the chair of pastoral theology at the University of Freiburg. Since 1902 he has edited the *Monatsschrift für Christliche Sozialreform*. During the semester 1906–7 he was rector of the University of Freiburg. His political aim is to bring about a realization of religious justice in social matters, through cooperation of democracy and socialism. *Address*: University of Freiburg, Switzerland.

BECKER, AUGUST: German Socialist and journalist; born about 1810; son of a clergyman; studied for a short time theology in Giessen where he became acquainted with Georg Büchner whose political creed he adopted. He was arrested and sentenced to four years' imprisonment, but was soon liberated, whereupon he went to Geneva. Becoming a zealous communist, he published pamphlets, and wrote articles in radical papers, notably the *Rhenische Zeitung* and *Vorwärtz*. In 1848 he began to publish, in Giessen, a journal called *Der Jüngste Tag*. He was elected to the Hessian legislature, and later emigrated to America, where, after a wandering and adventurous life, he died in Cincinnati, Ohio. in 1875, as a reporter for a daily paper.

BECKMAN, ERNST: Swedish editor, educator, and social reformer; born about 1840; studied at Hernösand seminary and in England and the United States. From 1876 to 1879 he was inspector of public schools in Södermanland, where he did much to promote instruction in sloyd. He was editor of *Ny Illustrerad Tidning* (Stockholm) 1880–83; studied social economy in Switzerland in 1884; and was thereafter sent by the Swedish government to study conditions among working men in England and Germany. He was a member of the first Swedish laborers' insurance committee (1884–89), and of a working men's protective committee (1891). In 1894 he was active in endeavoring to regulate labor conditions in Stockholm. He was an alderman of Stockholm from 1886 to 1895, serving on many labor committees. In 1886 he studied English charity organizations, the results of his investigations forming the basis for the organization of the Swedish charitable societies. From 1893 to 1899 he was rector of a coeducational school in Stockholm. As a member of the Riksdag (first elected in 1886) he has been active in promoting legislation for the regulation of labor disputes.

BEECHER, HENRY WARD: American clergyman and reformer; born in Litchfield, Conn., 1813;

studied at the Boston Law School; was graduated at Amherst in 1837; studied theology at Lane Seminary. In 1839 he entered upon his first pastorate, the Lawrenceburg, Ind., Presbyterian Church, but soon went to the Second Presbyterian Church of Indianapolis, where he served for eight years. In 1847 he accepted an invitation to become pastor of the Plymouth Congregational Church, Brooklyn, N. Y. This society had just been formed by a few leading men especially interested in temperance, the new school theology, antislavery, and other questions of reform. He labored with this people until his death, which terminated a pastorate of forty years. As a preacher and reformer he had world-wide fame and influence. In the Plymouth pastor the oppress ever found a champion for their cause. On his platform in *antebellum* days stood Frederick Douglass, the black man, pleading for his race. Here often appeared fugitive slaves whose freedom Mr. Beecher purchased with the contributions of his congregation. Here Wendell Phillips, the abolitionist, was invited to voice his convictions when driven by mobs from the halls of New York City. Here Kossuth, the exile, pleaded for his people, and $10,000 was raised for the freedom of Hungary. Here Mr. Beecher was confronted by a fierce mob which attempted to "clean out the nigger-worshiper." In 1850, in his famous star paper "Shall We Compromise?" in *The Independent*, he vigorously opposed the proposal of Webster and Clay to save the Union by moral compromise.

Beecher did much toward shaping the course of the Republican Party as a new political force. In 1863 he visited Great Britain, and there vindicated his national government. He spoke in several of its principal cities, where sympathy for the Confederacy prevailed. His life was often threatened; the press denounced him; and he frequently confronted vast, turbulent mobs, contending with them for an hour or more before they would listen to his argument. Once he reached the platform only by being carried over the heads of the dense crowd. But by his good humor, pluck, and eloquence he converted men to Northern principles. Tho a formidable opponent of the Southern policy, after the war he manifested great tolerance and compassion for the defeated states and their leaders. In 1870 he became editor-in-chief of *The Christian Union*, retaining this office till 1881. (See ABBOTT, LYMAN.) Through his voice and pen he had the widest influence of any preacher in America. Author: "Star Papers" (2 vols.); "Lectures to Young Men"; "Lectures upon Preaching"; "Patriotic Addresses"; "Evolution and Religion"; "Plymouth Pulpit Sermons." He died in 1884.

THOMAS A. BICKFORD.

BEESLY, EDWARD SPENCER: Positivist; author; born in Worcestershire, England, 1831; educated at Oxford; was assistant master in Marlborough College, 1854–59; professor of history, University College, London, 1860–93. His life has been principally devoted to the propagation of the positivist philosophy of religion, founded by Auguste Comte. He has also favored radical social reforms, and in 1863 presided at the organization of the INTERNATIONAL. From 1878 to 1901 he was president of the London Positivist Society, and in 1893 founded *The Positivist Review*, to which he is still a frequent contributor. In 1868, in recognition of his services to trade-unionism when it was suffering under unjust laws, he was made an honorary member of the Amalgamated Society of Carpenters and Joiners. Beesly is the translator of Comte's "Discourse on the Positive Spirit," and joint translator of the same author's "Positive Polity." He has written: "Catiline, Clodius, and Tiberius," 1878; and "Queen Elizabeth," 1892. *Address*: 21 West Hill, St. Leonards-on-Sea, England.

BELGIUM: A kingdom of Europe, formed as an independent state in 1830, with constitution (1831), and guaranteed neutrality by treaty of London.

I.—Statistics

Belgium has a population (1900) of 6,693,548, with 11,373 sq. m. It is the most densely inhabited country in the world: 589 to the square mile. About 3,000,000 of its inhabitants speak Flemish (in the north), and a slightly smaller number speak French (in the south). Almost all are Roman Catholics. Chief cities (1904): Brussels (capital), 598,599; Antwerp, 291,949; Liège, 168,532; Ghent, 162,482. Of the total population (1900) 3,324,834 were males and 3,368,714 females. Of the males 2,047,607 were unmarried; 1,146,774 married; 127,014 widowed; and 3,439 divorced. Of females 1,968,383 were unmarried; 1,143,483 married; 252,202 widowed; and 4,646 divorced. The birth- and death-rates per 1,000 inhabitants since 1847 are shown in the following table:

PERIOD	Birth-rate	Death-rate
1847–56	.....	23.52
1857–66	31.54	23.59
1867–76	32.47	21.73
1877–86	31.21	21.31
1887–96	29.04	20.92[1]
1897–1901	28.96	18.23
1904	27.60	16.89

[1] Death-rate for 1897–1900.

In 1904, the percentage of illegitimate births to total births was 6.59, having fallen from 7.20 in 1871–80.

	1880	1890	1900	1902	1903	1904
Marriages per 1,000 inhabitants	7.03	7.32	8.62	8.11	7.87	8.02
Marriages to 1 divorce	1 82	1 30	83	80	75	61

The annual numbers of suicides were: 1871–80, 441; 1881–90, 658; 1890–1900, 799; 1900–1, 856.

General education has been low but is rising. In 1902 the percentage of the population enrolled in elementary schools was lower than in any other country of western and northern Europe. In 1904 there were 859,436 pupils in 7,092 schools. In 1880, of the population more than seven years of age, 33 per cent were unable to read and write; in 1890, 28 per cent; in 1900, 22 per cent. There were, in 1904, 2,688 infant schools with 254,658 children, and 3,897 adult schools with 193,907 scholars. Middle-class public schools for boys numbered 88 with 17,112 pupils; and for girls 40 with 7,689 pupils. Royal atheneums and colleges numbered 35, with 7,641 pupils; normal schools, 58, with 4,980 students. There are 4 uni-

versities: at Brussels, Ghent, Liège, and Louvain (R. C.), with a total attendance of 3,780 students.

General Statistics

Besides these there are 80 colleges, 65 middle-class private schools for boys, 150 private institutions for girls, and numerous private primary schools, mainly under ecclesiastical care. There are 8 commercial high-schools, and 84 schools of design with 14,977 students. In 1871 the state appropriated 15,282,171 francs for primary education, and in 1903 the sum of 43,867,450 fr. Crime, measured by commitments in the assize courts, has fallen from 97 in 1890, to 72 in 1903, but commitments in the Correctional Tribunals have risen from 40,275 in 1890 to 56,754 in 1903. Commitments in police courts have likewise increased 54 per cent since 1880. The population in the workhouses (*dépôts de mendicité*) was 2,857 in 1880, and 4,781 in 1890; in the refuges there were 1,983 in 1898, and 1,733 in 1903; in the schools of charity there were 698 in 1890, and 2,222 in 1903.

In no other country is so large a proportion of the population employed in purely industrial occupations. Mining, especially of coal, is very important, and cheap fuel has led to considerable metallurgical industry. Manufacture is the most important source of wealth. Textile industries employed 169,493 people in 1896; clothing, 137,903; metal, 133,875; mining, 128,313; building, 93,942; food products, 90,285. Characteristic features are very low wages, and an unusual proportion of small industries. Belgian glass works lead the world. Brussels lace and carpets are renowned.

Engaged in Industry

(Not in private houses or public works)

Size	Enterprises		Workmen	
	Number	Per cent	Number	Per cent
With no employees...	165,000	70.08	.....	.....
1– 4 employees.....	54,500	24.09	95,000	13.92
5–49 "	14,800	5.12	177,000	25.96
50–499 "	1,500	0.63	250,000	36.66
500 or over employees.	200	0.08	160,000	23.46

Wages are low but rising. Blacksmiths (1903), made 17 cents per hour; carpenters, 15 cents; compositors, 13; laborers, 10; hod-carriers, 9; machinists, 13; plumbers, 15. (See Wages.)

Industrial Conditions

In 1896 more than one fourth of the population, without distinction of age or sex, earned less than 2 francs (40 cents) per day; 172,000 earned from 2 to 3 fr.; 169,000, from 3 to 4 fr.; and 102,000 over 4 fr. More than 100,000 men received from 3 to 3½ fr. per day; and more than 80,000 received less than 2½ fr. per day. Of the women, more than 100,000 received between 1 and 1½ fr. per day (less than 30 cents). The hours of labor are long.

Agriculture occupies a comparatively small place. In 1895, 1,204,810 persons or 18.79 per cent of the population were engaged in agriculture; and 49.5 per cent of the farmers owned their farms. These are usually very small, tho the average size is increasing somewhat. In 1895, there were 544,041 holdings of less than 1 hectare (2.47 acres). Agricultural wages, in 1895, were 1.98 fr. (38 cents) per day without food for men, and 1.22 fr. for women.

The coal industry has increased from a product valued at 169,680,000 francs in 1880 to 286,648,000 fr. in 1904. (See Coal.) There were (1903) 218 coal mines of which 123 were worked. 139,592 persons were employed in these, of whom 95,033 men, 6,976 boys, and 55 women worked underground. There were (1903) 16 pig-iron works, 35 blast-furnaces, 44 works for the manufacture of iron, 343 puddling furnaces, 35 steel-works, and 49 Bessemer converters. Of shipping, Belgium had (1904) 65 steamers and 4 sailing vessels, with a total tonnage of 102,737. The number of vessels entering Belgium (1904) was 9,063, with a tonnage of 11,176,239.

The commerce of Belgium more than doubled from 1890 to 1900. In 1904 the exports amounted to 2,183,300,000 francs; and the imports to 2,782,200,000 fr. Chief exports: coal, textiles, sugar, machinery, agricultural products. The commerce of Belgium with the leading countries was (1904): Exports to Germany, 505,473,000 francs; Great Britain, 392,324,000 fr., chiefly iron, steel, and iron and cotton manufactured goods; France, 346,670,000 fr.; Netherlands, 268,781,000 fr.; United States, 86,324,000 fr., chiefly rubber goods, glass, iron and steel work, jewelry. Imports from France, 465,684,000 francs; Germany, 351,025,000 fr.; Great Britain, 335,404,000 fr. (chiefly cottons, woolens, machinery); Netherlands, 240,873,000 fr.; United States, 222,301,000 fr., chiefly wheat, provisions, cotton.

II.—Constitution and Government

Belgium is a constitutional kingdom. The reigning sovereign is Leopold II.; the Premier, Comte de Smet de Naeyer. Legislative power is vested jointly in King, Senate, and Chamber of Deputies. The Senate has 110 members, of whom 83 are elected directly for eight years by manhood suffrage, tho heads of families, those with diplomas of higher education, those occupying certain positions, or those having certain property, may have one or even two additional votes, giving them a balance of power, much opposed by the Socialists. The 27 indirectly elected senators represent county councilors. The Chamber of Deputies has 166 members, elected for two years, one for every 40,000 people. Belgium has compulsory voting, and a system of proportional representation of minorities. The leading political parties are the Clerics or Catholics, the anti-Clerics or Liberals, and a well-organized Socialist party. The Catholics are generally strongest in the Flemish provinces, and the Socialists in the Walloon. The Senate stands: Catholics, 61; Liberals and Progressists, 43; Socialists, 6. The Chamber of Deputies: Led by the Premier, 87; Liberals and Progressists, 41; Socialists, 35; Christian Democrats, 2.

The estimated public revenue for 1906 was 558,863,927 francs; expenditures, 557,805,483 fr.; public debt (1905 consolidated), 3,117,038,048 fr. Taxation presses somewhat heavily altho the debt was largely contracted in the construction of public utilities, particularly the State railroads; and the revenue from these more than covers the interest.

The standing army numbers 49,731 men. It is recruited by voluntary enlistment, supplemented by annual levies. The war strength is 180,000 men.

Belgium was one of the first countries to develop State railroads. She began her system in

1833, and in 1904 the State had 4,008,291 meters (2,500, miles) and private companies 530,998 meters (330 miles). Belgium has more railroads per sq. m. than any other European country; and the rates are lower. In 1904 there were carried by the State roads 136,409,599 persons, and by private companies 16,455,767. The gross receipts of the State roads were 232,314,767 francs, of which 74,279,290 fr. were for passengers; and of the private roads 27,949,884 fr., of which 7,940,523 were for passengers. The expenses of the State roads were 138,381,322 fr., leaving a profit of 94,376,418; those of the private companies were 12,619,157 fr., leaving a profit of 15,330,327. The first cost of the State roads from 1834 to 1904 was 2,161,245,528 fr.; the total net receipts 1,885,332,731 fr., and the financial charges 1,740,895,391 fr.

State Railroads

On Jan. 1, 1905, there were 1,330 post-offices in Belgium. Postal receipts for 1904 were 30,095,288 francs; expenses, 15,256,520 fr. There were 1,438 telegraph offices, with 4,110 miles of line, carrying 15,586,354 dispatches; the receipts were 11,203,006 fr.; and the expenditures, 7,618,064 fr. There were 20,875 telephone stations, with 58,590 miles of telephone wire, and 47,010,611 conversations. The receipts were 4,956,011 fr. Telegraph and telephone lines are all owned and operated by the State.

III.—Social Reform

In Belgium reform ideas began to work early in the nineteenth century. The spirit of cooperation and organization came down from the Middle Ages. Belgian trade-unions are developed from old trade benefit societies which arose toward the end of the eighteenth century after the abolition of the old medieval gilds in 1795. Thus, for example, the Hat-makers' Benevolent Union was originally a trade friendly society, but became in 1838 "a society for the maintenance of prices and for resistance." Even down to the second half of the century the old spirit lingered. In 1867 the weavers at Ghent still bore on their banner the motto, "God and the Law" (*God en de Wet*).

Trade Unions

The Master Glass-workers' Association at Charleroi was established in 1836; the Free Typographical Association originated in 1842; the Jewelers' and Goldsmiths' Society in 1852. The trade-union movement in Belgium, however, early took a socialistic form. (For early Belgian theoretical and Christian Socialists, see COLINS; HUET; LAVELEYE.) Karl Marx, banished from Germany and Paris came with his friend Engels to Brussels, where they gathered around them a little band of Socialists, and here published the famous manifesto of 1847. Organization, however, did not endure till the International gained footing in Belgium in 1866. It spread rapidly in the crowded industrial cities, and especially in the mine region where men, and women too, worked long hours for piteous wages. Marx called Belgium the paradise of capitalism. Sections were formed at Brussels, Ghent, Antwerp, Bruges, and Charleroi, and elsewhere in the mining section. Papers were started, and some strikes were carried out. De Paepe became a leader. In 1877, however, he declared for Marxian socialism, and the movement became split. The anarchist wing, however, did not endure. A new and most important movement now sprang up, which has differentiated the Belgian Socialist movement from that of any other country, and made it one of the strongest in the world.

In the year 1879 a Ghent typewriter, an active Socialist, Edward ANSEELE, founded a cooperative bakery, and in connection with it a club, the *Voorwit*. Up to this time cooperation had not succeeded in Belgium, but this Socialist cooperative movement succeeded and spread. A similar organization, called the Maison du Peuple (House of the People), was started by the Brussels Socialists in 1882, and another at Verviers in 1884. In the next four years the movement spread through all the important Belgian cities and industrial centers. Soon the societies began selling other things than bread, till gradually the movement became one of vast size and importance. By 1893 the Maison du Peuple had 10,000 members, representing some 10,000 families, and manufactured 100,000 loaves of bread a week. It possest a large club house, which was the center of Socialist propaganda, a library, a tool store, and other property; and it provides coal, groceries, meat, furniture, clothing, medical attendance, and insurance, all at cooperative prices. It maintains a monthly, a weekly, and a daily. This cooperative society gave stability to the Socialist movement.

Socialism

In 1885 a Socialist workingman's party was organized (*Parti ouvrier belge*), and in 1893 this was able to effect in a few days a veritable revolution in the Belgian Constitution. Hitherto the Belgian Socialist had been able to accomplish little politically, because of property limitations to the suffrage. A bill to institute free suffrage was introduced into the Chamber and Senate and defeated. Immediately the Labor Party called a universal strike. M. Volders, the leader of the Labor Party, was arrested with two others. M. Buls, the Brussels burgomaster, ordered "The House of the People" closed, and prohibited meetings and processions. But this only added fuel to the flame. Collisions with the police took place. Numbers of men, women, and even children were shot down, and some mortally wounded. But the strike was won. On April 18th, only eight days after its rejection of universal suffrage, the Constituante (the Assembly) met, and a hurried plan to revise the Constitution and grant a vastly enlarged tho not universal suffrage was devised and carried, and the Labor Party declared the strike off. Since then the party has had a growing representation in the legislature, and the government has been compelled to introduce many reforms (see below). In 1902 the Socialists undertook to gain complete universal suffrage by another universal strike. This time, however, they were unsuccessful, and the attempt even resulted in some setback; nevertheless, the movement is still strong and growing. M. Vandervelde writes of it (1906):

In Belgium all labor unions and societies of any importance, with the exception of the glass-workers, compositors, and a small number of Christian cooperative societies, are affiliated with the Workmen's Party. According to the latest statistics there were 95,000 labor-union Socialists out of a total of 132,000 organized workers. The Socialist strength is thus about 72 per cent of the total. As for the cooperative societies, the great majority are not only commercial, but also political organizations. Some of them hold to the Clerical Party, and to be admitted to any of these one must fulfil his religious duties and pledge himself to the defense of "property, religion, and the family." But the other societies, much more powerful in the industrial centers, adhere to the Workmen's Party. It is necessary, on entering any of them, to accept the Socialist program and agree to the deduction from the annual profits of sums, more or less considerable, for use in the party's general propaganda.

Labor Organizations

The various local federations that compose the party present identical characteristics throughout the country. At the center is the cooperative society, whose home, la Maison du Peuple, is the home also of the friendly societies, the labor unions, the political groups, the artistic and educational associations, all of which constitute the federated organization. In Brussels, for instance, the cooperative society—la Maison du Peuple—includes about 20,000 families. Its busi-

ness averages about $1,200,000 annually. It has butcher shops, grocery, dry-goods, and department stores, a dairy and two large bakeries, which produce annually almost 12,000,000 loaves of bread of 2.2 pounds each. This society devotes annually about $10,000 to the Socialist cause, and moreover, furnishes free quarters to the seventy groups belonging to the federated organization of that city.

Similar organizations, tho in differing degrees of development, are to be found in all the principal centers. Thus, in the very bosom of capitalist society, is found another society, like a state within a state, the members of which are united, not only by their political convictions, but by economic ties that become more binding as time runs on, and that insure a stable and enduring organization.

These Belgian Socialist societies now number 238, with annual sales of $7,600,000. There are 6 Socialist dailies, notably *Le Peuple* (Brussels) and *Vooruit*, 22 weeklies, and 14 monthlies. These Socialist successes have compelled the Roman Catholic Church to make especial social efforts in Belgium. (See CHRISTIAN SOCIALISM.) Dr. Varlez writes of them (1906):

Especially have the Catholic Conservatives been active, and for every working-class Socialist or Cooperative Society they have organized a similar cooperative society, only in connection with the Conservatives. These cooperative societies, altho with less enthusiasm and vitality than the working-class societies, nevertheless slowly grow. They are largely supported by the Catholic clergy in the villages and country towns of Flemish Belgium. Many, however, of the most conservative Catholics oppose these efforts to organize such societies for fear that they will one day break away from their conservative moorings. They advocate instead, organizing the working class into religious charitable and beneficial societies, in union with the Church and wealthy conservative patrons. Many such conservative and religious societies are organized, particularly in the villages, and take a great variety of forms—organizations for the cooperative purchase of food, grain, machinery, and other supplies; for the improvement in the breeding of horses, cattle, and other animals; for cooperative dairies, breweries, and the like; for mutual relief and benefits, loans and insurance; for a thousand forms —all alike, however, in being organized under the patronage of the Church and opposed to the democratic Socialist organizations. Strenuously opposed by the Socialists, Christian, and non-Christian, attacked by the freethinkers, now numerous in every country of the Latin race, these agricultural religious organizations embrace now some 100,000 of the peasantry and are still growing.

State action for the working classes has been largely on the lines of savings funds and insurance for old age and for the unemployed and also of direct protection of laborers. There are special acts dealing with contract of employment (1900); truck-system (1887); shop regulations (1896); employment of women, children and young persons (1889) with many regal decrees incidental thereto; Sunday rest (1905); safety and security of labor (1899) completed by important decrees of 1905; workmen's compensation for accidental injuries (1903). There are also other institutions created by law on behalf of the working classes, viz.: councils of experts (1889); councils of industry and labor with a view to prevent and settle trade disputes (1887); trade-unions (1898); benefit societies (1894); laborers' dwellings (1889). In 1906 there was established a bureau in aid of the middle classes, dealing with industrial education and other matters concerning the small traders, etc. The State Savings-Bank of Belgium was established by a law of March 16, 1865, and to it was added the Pension Fund, established in 1850. Its total receipts in 1905 were 1,143,900,000 francs. The movement has now become international, and any one depositing in the savings-banks of France, Belgium, or Holland can transfer his account to any of these countries without cost. Savings-banks have had a remarkable development in Belgium, owing to incessant agitation on the part of the teachers, and are due to the initiative of the city of Ghent.

State Savings-Bank

They have spread to almost all the cities and towns of the country, especially since the issue in 1881 of savings cards, to which the children can attach stamps of 10, 5, or 2 centimes (one cent), and which, when they amount to a franc, can be deposited with the savings-bank, in any branch or in any post-office. At the end of 1902 out of a total of 1,151,756 pupils 360,000 had about 10,000,000 fr. in the banks. The bank has also been allowed by different laws to make loans to various funds of social benefit, such as cooperative societies, agricultural banks, and workingmen's dwellings. At the end of 1904, seven agricultural banks had loans amounting to 7,873,000 fr., and 166 societies for erecting workingmen's dwellings had loans of over 66,000,000 fr., and more than 33,000 houses had by this means been erected.

The Old Age Pension Fund, established in 1850, permits the granting of pensions not above 1,200 francs, and made payable at different ages, between fifty and sixty. This has become of particular importance since the granting by the State, in 1900, of premiums to persons entitled to a pension through the endowment of a friendly society, or to persons of modest means, directly connected with the institution. A Department of Life Insurance was created in 1889, and connected with the savings-bank, but limited to the insurance of those who have borrowed for the construction of a workingman's dwelling. In 1894 it widened its scope, and is now open to all, with the maximum limit of 5,000 fr. insurance.

Public Labor Bureaus for the Unemployed (Bourses du Travail), mainly of a charitable nature, have existed in Belgium for some years, beginning at Liége in 1888, but have not been favored by the working classes, except at Liége itself, and have only been made use of by the least efficient, and that without large results. Their main effort has been to find places for those out of work. More recently, however, beginning at Ghent in 1901, there has developed a plan of insurance against unemployment, which has had more success, and is being largely copied throughout Belgium and in other countries. This is the creation of a public fund by the municipalities, to be increased by private gifts, and to be used in supplementing the out-of-work benefits given by trade-unions. Thus every trade-unionist receiving a small out-of-work benefit from his union, can, under due restrictions, have this supplemented by a grant from the fund of perhaps 50 or 30 per cent of the amount of his benefit. Non-unionists can get the same aid by paying dues to a special thrift fund. This plan has the advantage of being taken out of the sphere of charity and of cooperating with and calling out the efforts of organized labor. By May, 1904, there were seven such funds established by the principal cities of Belgium. The portion of the plan for trade-unionists seems to have been very successful; whereas that for non-unionists seems to have failed. Labor colonies, for the unemployed, or more truly for vagrants, are maintained by the Belgian Government at Merxplas and Wortel, and are called "Colonies Agricoles de Bienfaisance"; they are practically penal colonies for vagrants, committed by judicial authority or municipalities. They are committed for a certain period, but receive a small wage, which is kept for them. Merxplas is for those who have committed some misdemeanor; Wortel for those who

The Unemployed

have committed none, but are reduced to vagrancy. There is also a private labor colony at Haeren, near Brussels. There is a system of Central Inspection and a Superior Council of Relief. Under these each commune is responsible for its relief work, tho weak communes may combine. "Commissions d'Assistance" are created for each commune, or union of communes, with from five to ten members, among which must be a clergyman, an alderman, and a laborer. No salaries are paid, tho the laborer can be indemnified for time lost. Women are eligible. The indigent are divided into those unable to work, those willing to work, but unable to find it, and those unwilling to work. To the first class is given relief, indoor relief for the most part. Private charity in Belgium is very great, providing for at least one half of the indigents, but is controlled by the State. For the other two classes there are workhouses, refuges, and schools of charity. The workhouses are for persons able to work, but who do not. The refuges are intermediary between the workhouses and the poorhouses, for those willing to work, but unable through sickness, old age, or disability. Persons found begging can be assigned to these for seven years. In 1901 there were 6,384 in these refuges. The schools of charity are compulsory training schools for youths up to eighteen, who have become vagrants or have committed misdemeanors. The expense for these institutions is divided equally between the State, province, and commune. Very low wages are paid in the workhouses and refuges.

Important Belgian societies and institutions for social reform are:

Institut de Sociologie Solvay, founded 1901. Leopold Park, Brussels.
Office du Travail. 2 Lambermont, Brussels.
Caisse d'Epargne. 50 Rue Fossé aux Loups, Brussels.
La Bourse du Travail. 17 Rue de l'Amigo, Brussels.
La Maison du Peuple. 11 Rue Joseph Stevens, Brussels. (Socialist Cooperative Society.)
Ligue Belge du Droit des Femmes, founded 1892. Secretary, Mlle. Marie Popelin, Hôtel Ravenstein, Brussels.
Ligue Patriotique contre l'Alcolisme, founded 1879. Secretary, Dr. de Vaucleroy, 306 Avenue Louise, Brussels.
Société Belge d'Economie Sociale, founded 1881. Hôtel Ravenstein, Brussels.
Société Belge de la Paix et de l'Arbitrage, founded 1885. Secretary, Henry de la Fontaine, Sénateur, 81 Rue d'Arlon, Brussels.
Société Belge de Sociologie, founded 1899. Secretary, Camille Jacquart, 11 Rue Brialmont, Brussels.
Société de Moralité Publique, founded 1881. Secretary, Ed. Belleroche, 65 Rue de Stassart, Brussels.

BELLAMY, EDWARD: American nationalist and author; born in Chicopee Falls, Mass., 1850. He graduated at Union College and studied law, but soon entered journalism, writing for many papers, principally the Springfield *Union*. His first novel was "A Nantucket Idyl." "Dr. Heidenhoff's Process," "The Blind Man's World," and "Miss Ludington's Sister" followed. All are dreamy, fantastic novels, but with such power that Mr. Howells declared that "the mantle of Hawthorne has fallen upon Mr. Bellamy." He then wrote "Looking Backward," upon which his great fame depends, and which many consider to be the ablest socialistic Utopia ever written. (See NATIONALISM.)

In *The Nationalist* magazine he has related how he came to write that book; how it took shape from an original plan to write a sort of fairy tale of social felicity—"a cloud palace for an ideal humanity"—in the shape of a great world nation. "The idea of an industrial army for maintaining the community, precisely as the military army protects it, suggested the advisability of seeing if a plan which was found to work so well for purposes of destruction might not be profitably applied to the business of production, now in shocking confusion." This idea had been vaguely floating in his mind for a year or two, but it was not until he began to work out the details of his romance that he perceived the full potency of the instrument he was using. This led to a complete recasting of the book, both in form and purpose, and the author was filled with the fervent desire to acquaint the people of his country with its beneficent possibilities—a desire which the popularity of "Looking Backward" has abundantly realized. The form of a romance was reluctantly retained, with a view to obtain a reading for the book.

The year 2000 was fixed upon as the date of the story, at which date Mr. Bellamy believed that nationalism would be in operation.

The book soon made a sensation; a Bellamy Club was started in Boston, and from that grew the Nationalist Club, and then the Nationalist movement. (See NATIONALISM.) The book reached a sale of over 500,000 copies in this country, and has been translated into most of the languages of Europe. In the beginning of 1891 Mr. Bellamy commenced the publication of a weekly, *The New Nation*, as an organ of nationalism. It was suspended, however, at the close of 1893. In 1897 he published "Equality," a continuation of "Looking Backward," and on the same lines, but a larger book. Bellamy died in 1898.

BELLERS, JOHN: Quaker; philanthropist; born about 1654. He was a member of the Society of Friends, joint lord of the manor of Coln St. Aldwyn's, and devoted to philanthropic projects. He wrote numerous pamphlets, the best known of which is "Proposals for Raising a Colledge of Industry," in which he proposed that the rich should provide capital and receive profit by building a college in which destitute men and women could find work. He died in 1725.

BEMIS, EDWARD WEBSTER: Superintendent of water works; economist; born in Springfield, Mass., 1860; graduated from Amherst College, 1880; Ph.D., Johns Hopkins University, 1885; in charge of the departments of history and political economy at Vanderbilt University, 1887–92; assistant professor in economics, University of Chicago, 1892–95; professor of economics and history at Kansas State Agricultural College, 1897–99; head of the Department of Municipal Monopolies in the Bureau of Economical Research, New York City, 1899–1901. In 1901 he was appointed superintendent of water works in Cleveland, O., by Mayor Johnson, a position he still occupies. An investigator and writer upon municipal monopolies and kindred questions, he has appeared frequently before courts and state commissions as expert witness for cities in cases involving the rights of the people with respect to gas companies. Mr. Bemis, while believing in municipal ownership of public-service corporations and public ownership of railways and telegraphs and a few other monopolies of that

character, does not agree with socialism in the operation and ownership of competitive industries, but believes in heavy taxation of all special privileges and in legislation safeguarding the health, education, and welfare of the community. Author: "Municipal Ownership of Gas in the United States," "Cooperation in New England and the Middle States," "The Labor Organizations of America," "Municipal Monopolies," "Reports of the Cleveland Water Works." *Address*: Cleveland, O.

BENTHAM, JEREMY: Political economist; born in London, 1748; graduated at Queen's College, Oxford, at the age of eighteen. He was called to the bar in 1772, but never practised his profession. Bentham became the greatest critic of government and legislation in his day. His first publication was "A Fragment on Government" (1776); and his first important economic treatise was "A Defense of Usury," in which he tried to prove by close reasoning that when the legislature fixes a maximum rate of interest it does not benefit the right persons, but encourages deceit and raises the rate of secret interest by adding the danger of discovery. He urged that every man is the best judge of his own welfare, and that it is for the public good to leave him free to seek it. Bentham published "A Manual of Political Economy," but he influenced economic thought even more by his philosophic writings. Beccaria in 1764 had coined a convenient phrase, "The greatest happiness of the greatest number," and Bentham took this up and made it the ruling principle and chief end of legislation. This, too, he taught to be identical with the extremest *laissez-faire*. Bentham was also a great believer in education, especially of the working classes, whom he considered the most important part of the community. He aided Robert Owen by taking shares in his factory at New Lanark.

Bentham's works and life, edited by Bowring, fill eleven volumes, of which the tenth and eleventh contain the life. His chief economical works are: "Protest against Law Taxes"; "Supply without Burden"; "Tax with Monopoly" (i. e., a tax on bankers and stockbrokers); "Defense of Usury and of Projects in Arts"; "Manual of Political Economy"; "Conversion of Stock into Note Annuities"; "Invention and Discovery"; "Hard Labor Bill"; "Tracts on Poor Laws and Pauper Management." He died in 1832.

BENTLEY, WALTER E.: Founder of The Actors' Church Alliance; born in Sheffield, England, 1864. He came to the United States in the eighties, and entered on a commercial career, but soon forsook that for the stage, toured the country for several seasons as a Shakespearian actor, and attained great success. Later he sought holy orders in the Episcopal Church, was ordained by Bishop Huntington in 1892, and served in the diocese of central New York until 1897, when he was called to be vicar of St. Mark's, New York, afterward becoming assistant to the Rev. Dr. Heber Newton. While at St. Mark's, Mr. Bentley aided in forming "The Peoples Club" No. 1, and for some time was its energetic secretary. In 1899 he founded The Actors' Church Alliance, and as national secretary and organizer he extended it throughout the United States and Canada and all over Great Britain and Ireland. Mr. Bentley is now rector of the Church of the Ascension in Brooklyn, where, in addition to his religious work, he has a well-equipped theater in full operation as an important adjunct to religious and social effort. *Address*: Church of the Ascension, Kent Street, Brooklyn, N. Y.

BEQUESTS. See Gifts and Bequests.

BEQUEST, POWER OF: This is an inheritance of modern nations from the Roman law, which allowed three fourths of the inheritance to be willed away from the next of kin. The Koran allows two thirds, and the Mishna recognizes gifts of property to take effect on death. (See Gifts.)

BERGER, VICTOR L.: American Socialist; editor of the Milwaukee daily *Vorwärts*; born at Nieder Rehbuch, Austria-Hungary, 1860; educated in Budapest and Vienna. On account of reverses the family emigrated to the United States, where Berger at first worked as a metal polisher, later becoming a public-school teacher. A pioneer organizer in socialism, he became prominent in the Social Democracy and in the Social-Democratic Party, and has been a member of the latter party's executive board from the beginning. Tho a firm Socialist, he has been a leader of the liberal wing, for which he was criticized by members of the "orthodox" wing. He has been the party candidate in Milwaukee for the mayoralty, for Congress, and for the Senate. He has written: "Socialism, What it is and What it is Not (1900); "The Trust Question" (1900); and "Municipal Socialism" (1902). *Address*: 614 State Street, Milwaukee, Tenn.

BERLIN: Capital of the German Empire; founded in the twelfth century; prominent since the fifteenth century, and a leading city from the time of the Great Elector Frederick William (1640–88). Under Frederick the Great large manufactures grew up, and the city became an industrial center as well as a royal residence. It has recently grown very rapidly in population, as will be seen from the following figures: 1800, 172,132; 1870, 774,498; 1890, 1,578,516; 1900, 1,888,574; 1905, 2,033,900. In 1897 the capital stock of companies doing business in Berlin was 1,100,000,000 marks with an output of nearly 2,000,000,000 mk. There were (1904) 12,967 factories employing 272,768 persons. Cloth printing and dyeing, iron and steel, and clothing are the leading industries. Twelve railways pass through the city, and about 35,000 freight steamers enter the Spree annually. There has been much overcrowding, and tho a great deal has been done the evil still remains. The death-rate, however, has fallen from 32.94 in 1876 to 24.58 in 1901. Municipal lodging-houses provide cheap and sanitary lodgings for the needy, and great efforts are made to make it possible for the poor to live outside the city (see German Municipalities). The poor relief is under strict municipal control, tho about 3,000 unpaid citizens assist the paid workers (see Elberfeld System). In 1904–5 Berlin spent 14,817,364 marks on poor relief, besides 8,288,300 mk. on free hospitals for the poor.

The city government of Berlin is most efficient. The council is composed of 144 members elected for six years, one third of the seats being vacated every two years. The council elects the burgomaster and other chief officials. In spite

of its large population the city has only six seats in the Reichstag, which in 1900 were occupied by four Socialists and two Radicals. In the Landtag it has nine seats, all of which were held by Radicals in 1898. The franchise for city elections, however, divides the voters (all males over twenty-four, who are not criminals or paupers) into three classes according to the taxes they pay, a system which greatly favors the larger taxpayers.

The city has gone very far in the direction of public ownership, and with brilliant success. It owns four immense gas-works, electric-lighting plants, and water-works estimated at 65,000,000 marks; the latter give the city a net income of about 2,000,000 mk., and a sinking-fund for paying off the original cost. The sewage system is considered a model and there is a successful municipal sewage farm which enables the city to carry on a very remunerative garden trade. There are municipal abattoir and fourteen municipal markets. The street-car system is private until the plants revert to the city in 1911; but the companies pay over 800,000 mk. annually in taxes, pave the streets on which the cars run from curb to curb, and are strictly under the control of the municipality. The municipal debt of Berlin was 351,979,367 mk. in 1904, but there were assets of 749,123,593 mk. The receipts and expenditures in the same year were 181,758,962 mk. This was considered favorable, and the taxes on incomes of less than 900 mk. were remitted, and also the rent tax. The taxes in 1904–5 were 75,367,504 mk. or 38.10 mk. per capita. The University of Berlin (founded 1810) and its various educational, literary, artistic, musical, and scientific institutions make it a brilliant intellectual center.

BERNSTEIN, EDUARD: Leader of the Revisionists or evolutionary wing of the German Social Democrats; born in Berlin, 1850, of Jewish parentage, his father a locomotive engineer; educated in the Werder Gymnasium. He held a position in a bank from 1866 to 1878, and then became private secretary to Karl Hoechberg, a millionaire supporter of the Social-Democratic Party. Expelled from Germany by the anti-Socialist legislation of 1881, he went to Switzerland and edited the *Sozialdemokrat*, the efficient organ of the Social-Democratic party. He resided in London from 1888 to 1901 when he returned to Berlin, and in the following year was elected to the Reichstag from Breslau (reelected 1903; defeated 1907). In 1899 he published his famous work "Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratic," the book which has led to the great "Revisionist" controversy in the German socialist party. It was written in defense of a series of articles he had contributed to the *Neue Zeit*, and which contained the following sentences:

> The Social Democracy has neither to expect nor to wish an early downfall of the existing economic system, if such is thought to be the product of a great devastating crisis. I openly declare that I have not much concern nor use for what is commonly understood as the "ultimate aim of socialism." This aim, whatever it may be, is of no importance at present; the *movement* is of *all importance* to me. And by the term "movement" I understand not only the general movement of society, that is, social progress, but also the political and economic agitation for effecting this progress.
>
> If the Social Democracy should in the present state of society actually take possession of the political power, it would at once be confronted by an unsolvable problem. It could not immediately decree away capitalism; indeed, not even dispense with it. And also, it could not guarantee capitalism the security which it must needs have in order to perform its functions.
>
> Thus the question is raised whether this state of things would not postpone the realization of socialism to a day never to come, or at least postpone it for generations. If under the realization of socialism is understood the establishment of a strictly regulated communistic state of society, then this seems as yet very distant to me. On the other hand, it is my firm belief that the present generation will see the realization of *much socialism*, if not in a patented form, yet certainly in a very material way. (*Neue Zeit*, No. 18, Jan. 29, 1898.)

Accordingly, Bernstein demanded working for socialistic reforms under the present system, expecting this system to gradually grow into socialism. These views were at once considered heretical by orthodox Socialists all over the world. English life with its practical character, and the work of English and German statisticians and political economists, had had their effect on Bernstein. He follows Marx without considering him infallible.

There was an effort to read Bernstein out of the party, but in the Hanover convention of 1899 the South-German Social Democrats stood by him almost in a body. Auer, the party secretary, was one of his sturdiest defenders. David Peus, Von Elms, Frohme, Heine, and others were with him. Vollmar could well say at the close of the convention, "The renewed attack of the 'party purifier' has been repelled." And altho the Bernstein theory was rejected at the conventions in Lübeck and Dresden, it has obtained such an influence in the party—especially among the trade-union leaders of Germany—that it cannot be driven out of Social Democracy. Bernstein's great opponent is Karl Kautsky.

In addition to the work mentioned in the foregoing, Bernstein has written "Zur Theorie und Kritik des Sozialismus," in the *Sozialistische Monatshefte* (Berlin); "Wie ist Wissenschaftliches Sozialismus möglich?" (ib.); and "Die heutige Sozialdemokratie in Theorie und Praxis" (1906), besides numerous articles and essays. He has also edited the writings of Lassalle. *Address:* 5 Rosenheimerstrasse, Berlin W., Germany.

BESANT, ANNIE (*née* **WOOD**): English writer and lecturer; born in London, 1847. Her father dying while she was yet young, she was brought up by her mother under straitened circumstances, mainly at Harrow. She married the Rev. Frank Besant in 1867. Two children were born to them, and during a sickness of the younger Mrs. Besant fell into great doubts as to the goodness and then as to the being of God. She strove to find comfort from High Church fathers and Broad Church thought (consulting, among others, both Dr. Pusey and Dean Stanley), but failed to find relief, and became an avowed atheist. Her husband felt that he must leave her and take her children, even by force of law, from what he considered her pernicious teachings. This not unnaturally embittered her against Christianity and the Church, and she devoted all her energies to writing and lecturing for Free Thought. Becoming acquainted with Mr. Bradlaugh, she spent many years working with him, lecturing through all England, and editing *The National Reformer*. She became convinced of and advocated the necessity of neo-Malthusianism—in

limiting the number of children, especially among the poor. Gradually she came to work more among and for the poor, and at last became an avowed Socialist and was for a time the most famous and active woman worker for socialism in England. She was especially active in work for women, organizing them into unions, and in particular successfully conducted the great strike of the match girls in East London. She wrote continually, becoming a FABIAN, and the author of one of their collection of essays. Her socialism finally took her away from Mr. Bradlaugh, and more recently her religious nature has made her embrace theosophy, becoming at first the friend and confidante of Madame Blavatsky, and now practically her successor. At present it is to theosophy that she devotes her main time and thought. Her writings are very numerous, mainly brief essays or tracts on free thought, Malthusianism, socialism, and theosophy. In 1885 she wrote an interesting book of "Autobiographical Sketches."

BESANT, SIR WALTER: English author and philanthropist; born at Portsmouth, 1838; educated at King's College, London, and Christ's College, Cambridge. After graduating, he accepted the appointment of senior professor in the Royal College of Mauritius, but soon after resigned and returned to England. He was the author of numerous works, one of which had an important social outcome. It was due to an ideal pictured in his "All Sorts and Conditions of Men" that the People's Palace in East London was built—a large club house for workingmen, where they can find art, amusement, education, bathing, gymnasium facilities, etc. Besant died in 1901.

BETHEL: A remarkably successful colony for epileptics and other unfortunates at Bielefeld, Westphalia, Germany. The colony began with epileptics, tho now it embraces all classes of misfortune, bodily and otherwise. In 1867 a few Westphalian pastors and laymen, following the example of Pastor Bost of La Force, in Dordogne, France, decided that the Church had a duty toward the epileptic. A farmhouse near Bielefeld was bought; a few epileptics came; and the colony was called Ebenezer—"the stone of help." Two years later a home for deaconesses was planted close by to train workers, and was called Sarepta—"the place of purifying metal." The names are important because they show the spirit of the place. Three years later Pastor von Bodelschwingh and his wife were placed in charge. Pastor von Bodelschwingh's father was Prime Minister of Prussia; his wife's father was likewise in the Prussian Cabinet. To-day, instead of one building, there are over 150, and Bethel now receives every class of unfortunates. Indeed, any one in trouble may come. The main branches of the colony are five in number: (1) The home for epileptics, or Bethel proper; (2) Sarepta, the home for training nurses (now numbering about 1,100); (3) Nazareth, the brotherhood for training deacons (about 370); (4) Wilhelmsdorf, the colony for vagrants and the unemployed; and (5) the Workmen's Home Association, an organization for providing homes of their own for the working classes of Germany.

Among the Bethel's 150 buildings there is place for virtually any ill. It has a large idiot colony, nearly one third of the inmates being of this class. It has two orphanages called "The Good Shepherd" and *Kinderheim*, "the Children's Home." For inebriates there is the *Friedrichshutte*, "Frederick's Cot," named for the late German Emperor, and opened just after his demise. One remarkable spot on the colony grounds is the *Eickhof*, where wealthy voluntary patients, who have made shipwreck of life, through drink or fast living, may come, and, among equals of their own class and surrounded by physical comforts, be compelled nevertheless to labor with their own hands. There is also a house which welcomes those who can find no opening elsewhere, because they have been convicted of dishonesty of some kind. Such are some of the wide charities of this unique colony.

The daily life of the colonists is divided between work and prayer. The whole atmosphere of the place is religious, tho religion is forced upon none. Yet without it Pastor von Bodelschwingh would say Bethel could not live. But even the epileptic children and the noblemen's sons must work. It is the genius of Pastor von Bodelschwingh which finds work which each can do. Almost all that Bethel uses is made by the colonists: houses, furniture, clothing, food, etc. The carpenters live for the most part in a house called Little Nazareth. Near this is the tailors' home, Peniel, "the face of God"; not far away are "Horeb," the shoemaker's house; "Gilgal," the blacksmith's shop; "Sharon," the seedsman's store. There are bookbinding, book printing, and bookselling. Books made at Bethel are sold throughout Germany. There are also saddlers, basket-makers, and other trades. "Hebron" is the farmhouse of the colony. They also make bricks in Bethel, turning out 4,000,000 bricks per year.

A most important part of the colony is Wilhelmsdorf, a colony for the unemployed. But for this see LABOR COLONIES. Nor is even this all. The Workmen's Home Association makes loans to working men, on security of land and house, and so enables them to own their homes and a little land. Skilled epileptics are the architects and builders of these houses, tho to-day the work is spreading to different portions of the empire. Bethel largely supports itself by the work done by its members. Little or no pay is given even to those who give the skilled work of overseeing or directing. They are assured a home and livelihood; in case of sickness or need they know that they and theirs will be provided for with loving care; what they need they can have. Out from the training-homes, therefore, pour men and women who, with no thought of pay, give trained effort that guides the multitudinous activities of the colony, and sends out even foreign missionaries to carry on similar efforts in Africa and elsewhere. Yet money is made in many ways. Into one busy house in the colony come cast-off clothing or articles of any nature sent from all over Germany, to go out in most cases renewed and fit for use by somebody in the colony, or to be sold at low price to the peasants in the vicinity. A poor woman in Germany collected from her friends and neighbors a garretful of old corks and sent them to Bielefeld. To-day the traffic in old corks fills several houses at the colony, employs forty clerks, and brings in $10,000 per year. A wealthy patient arrived at Bielefeld who did not know how to do anything except collect postage-stamps. Bodelschwingh set him to doing this. To-day

the postage-stamp bazaar of the colony occupies a house, employs many clerks, and brings in considerable revenue. Children from all over Germany collect used stamps and send them to the colony. There is at the colony a "fragment man" who has a genius for turning into use and money the fragments which other people throw away. In more ordinary lines of trade, Bethel puts up and sells over the world pure bromide, for which epileptics have such continual need and which it is difficult to get pure. In ten years over 10,000 epileptics have been thus supplied in Germany alone.

Bethel is not, however, wholly self-supporting. It needs gifts and receives them. The royal house of Prussia takes great interest in it and gives it favors and gifts. But more particularly does Bethel rely upon the interest and gifts of the Westphalian farmers who live in the district. Pastor von Bodelschwingh is a skilled solicitor of aid. Once he asked all German parents to give him a *pfennig* for each sound and healthy child, for him to spend on the maimed and unfortunate. At present about $7,510 per year comes from the school children of Germany. Some $50,000 per year is collected for the colony by sixty regular collectors. The neighboring provinces appropriate to its use $15,300 per year. Altogether Bethel has and spends, apart from the labor colony, about $300,000 per year. It has property valued at 6,562,057 marks net.

BETHEL (SHELBY COUNTY, MO.): A communistic settlement of 4,000 acres, established about 1844 by a German-American, Dr. Keil. With little capital, but great industry, the community by 1854 had a woolen-mill, a grist-mill, several shops, and a church; the population was then 650. In 1855 Dr. Keil, with eighty settlers from Bethel, started a similar community of 18,000 acres at Aurora, Ore. Dr. Keil was president of both; and down to 1872 both properties stood in his name, but were administered by a board of trustees. In 1872, however, Dr. Keil gave each adult member a title deed to one parcel of land, tho the administration remained communistic. The life was simple and uneventful; a strict family life was maintained. Dr. Keil died in 1877, and Bethel dissolved in 1880 and Aurora a year later.

BIBLE AND SOCIAL REFORM, THE: Charles Kingsley called the Bible "the reformer's guide," and declared its keynote to be justice from God to those whom men oppress; glory from God to those whom men despise." Herr Todt, the German Christian Socialist, wrote: "Whoever would understand the social question and contribute to its solution must have on his right hand the works on political economy and on his left the literature of scientific socialism, and must keep the New Testament open before him."

Those who hold that the Bible teaches definite principles as to the formation of human society upon earth, usually maintain that the Old Testament, through its history and in the Mosaic covenant, teaches the general principles of national righteousness, while the New Testament bids us fulfil this righteousness through the life in Christ in the heart. It is held by many Christian Socialists that the Old Testament covenant teaches what may be called the law for society. It founded a theocracy on earth. God was the Universal Father; every man of the theocracy a brother. Property in land was not absolute; the land was conceived as belonging to God. No individual could own it in fee simple. He could only use it. In its use he was inalienably protected. It came to him through the family as an inalienable inheritance. If, through poverty, or misfortune, he temporarily parted with it, it returned to him in the year of jubilee. No landless, homeless class could, therefore, be *permanently* developed among the Hebrews.

The law went further. It cared especially for the poor, the opprest, the children, the fatherless, the widow. Usury (or interest; all scholars agree that the two words originally meant the same thing) was positively forbidden between members of His kingdom. The law provided for every one's independence. It not only provided land for the worker, but defended him in the ownership of clothes, tools, etc. (capital), which could not *permanently* be taken from him. If taken as a pledge, they must be returned before night. No permanent mortgage indebtedness was, therefore, possible on either land or capital—that is, the law was truly socialistic in providing in the name of organized society for both land and capital for every family. And this was *not*, be it remembered, a law of mere individual righteousness. *In order to reap its benefits, the family had to belong to the theocracy.* The Jew could take interest from a foreigner; the foreigner could be enslaved, even killed. The law was essentially national and institutional.

Such was the law of the Jewish kingdom, however and whenever developed. These conclusions are not therefore bound up with any view of the Higher Criticism. The Jews did not indeed observe it. They wandered far from it. But the law endured. The psalmists and the prophets are full of blessings on those who keep the law; are full of woes and condemnation upon the nation that wanders from it. The ceremonial was the precious shrine of a moral law still more precious. It is the moral law that is prominent. In the Psalms, Canon Fremantle has told us, there is not one word about circumcision, not a word about the passover, not a word about Sabbaths, not a word about ceremonial uncleanness. Just relation between man and man; God in the natural, the national, and social life—these are the constant themes. The same is true of the prophets. Isaiah says: "Bring no more vain oblations: incense is an abomination to me; the new moons and Sabbaths, the calling of assemblies, I cannot away with; it is iniquity, even the solemn meeting. Learn to do well; seek judgment [justice]; relieve the opprest; judge the fatherless; plead for the widow." . . . Micah says: "Will the Lord be pleased with thousands of rams or with ten thousands of rivers of oil? . . . What doth the Lord require of thee, but to do justly and love mercy and to walk humbly with thy God?" Such was the kingdom of heaven, of the law, and of the prophets. They thundered, not against the ritual law, but against those who robbed it of its meaning. They witnessed not against sacrifices, but against sacrifices of other people's property.

But the law failed. Law could not save, as law cannot save to-day. And yet it did not fail. It was *the schoolmaster to bring us to Christ.*

"What the law could not do in that it was weak through the flesh," that Jesus Christ came to fulfil. This is the *second* half of Bible sociology.

Christ's first preaching was of a kingdom.

"From that time Jesus began to preach, and to say, 'Repent, for the kingdom of heaven is at hand.'" He sent out His disciples and the seventy to preach "the Gospel of the kingdom." Almost all His parables are about the kingdom. Of the kingdom are His main discourses. Just before His crucifixion He entered Jerusalem as a king. Before Pilate He declared that He was a king. On His cross was the inscription in three representative languages of the earth, declaring Him to be a king. After His resurrection He continued forty days "speaking of the things pertaining to the kingdom of God." What did Jesus Christ mean by the kingdom of God? A kingdom implies four things. It implies a *king*, a ruler; it implies a *law*, the law of the king; it implies, *subjects* who obey, or should obey, the king; it implies a *realm*, where the king rules. What king, law, subjects, and realm does Christ refer to? Where is the kingdom of heaven? It cannot be far away, because eighteen centuries ago Christ declared that it was "at hand." It cannot be unknown, because Christ referred to it in His first utterances as something that His hearers perfectly well understood. It must by them have been understood of that kingdom of God which Moses tried to establish; of which David and the kings were faulty symbols; for which the prophets prayed and the poets sang; to which every Jew looked forward with a longing the more passionate the more it seemed deferred. Undoubtedly this was what the Jew understood by Christ's teaching. Yet it was not to be as they thought. It was to be spiritual, and for all nations. It was not to come by earthly might or by any law. It was to be chosen of men in freedom, not forced upon them; it was to come "without observation," and by the power of the Spirit. Such, in brief, is the social teaching of the Old and New Testaments. (See articles CHRISTIANITY; CHRISTIAN SOCIALISM; JUDAISM.)

BIELEFELD. See BETHEL.

BIMETALISM: Term designating the use of gold and silver as money at relative values set by legislative enactment, or the union of these two metals in circulation as full money, at a fixt rate; specifically that system of coinage which recognizes both coins of silver and coins of gold as legal tender to any amount, or the free coinage and concurrent use of the two metals as a circulating medium at a fixt relative value.

The final report of the (English) Royal Commission on Gold and Silver, reporting in 1888, describes bimetalism as follows: "A bimetallic system of currency to be completely effective must, in the view of those who advocate it, include two essential features: (*a*) An open mint ready to coin any quantity of either gold or silver which may be brought to it. (*b*) The right on the part of a debtor to discharge his liabilities, at his option, in either of the two metals, at a ratio fixt by law." It is usually understood to mean that the two metals are used thus at a fixt proportion to each other, as in the countries of the Latin Union, in which the ratio of 1 gold to 15½ silver by weight formed the legal basis, or as in the United States, in which the ratio is 1 to 16.

Bimetalism as an economic question is of recent date, the word having been first used by M. Cernuschi in 1869, altho the concurrent use of gold and silver as money is as old as civilization. (See MONEY.) The modern discussion of it, however, arose only shortly before the fall in the gold value of silver, which began about 1873.

History

Up to the year 1819 almost all nations issued coins of both gold and silver, as well as of other metals, and tried to regulate their relative values by royal or governmental proclamations. Altho supply and demand continually tended to change the relative value of the two metals, and altho from about 1760–1810 enormous quantities of silver poured into the world from mines in Mexico and elsewhere (so that in 1800 the world's annual silver product was nearly three times its product in 1700), the actual alteration in the relative values aforesaid was but slight. In 1803, therefore, France adopted her famous law, making fifteen and a half parts of silver equal to one part of gold in all transactions, which had the effect, despite still greater changes in relative production, of maintaining the relative values of the metals almost exactly steady at the figures named until the demonetization of silver by Germany in 1873. England, however, in 1816, under the second Lord Liverpool, took an opposite course, and demonetized silver as a standard, and ever since has used it only as a metal for subsidiary coinage. But now began a contraction of the currency of the world. The silver product of Mexico, owing mainly to revolutions in that country, fell off one half; the total gold product of the world for various reasons declined; paper currencies in France and England were retired; the United States (see CURRENCY) went through marked depressions, with all forms of wild state banking. At the same time increasing discoveries and inventions cheapened production.

By 1849 prices had fallen some 65 per cent, and money (in England, gold) had become by so much the more valuable. Contracting currency (see CONTRACTION) increased the value of loans. But suddenly (1849) came the gold discoveries of California and Australia. In 1859 thirty times as much gold was produced in the world as in 1810. Money became cheap. Prices rose. Gold threatened to be so plenty that monometalists began to talk about demonetizing it. From 1862–1865, moreover, the United States issued paper money (greenbacks, etc.) and liberated $600,000,000 of gold, which went to Europe, and mainly to England. If the gold-holders and gold-lenders were to retain any advantage from their gold, it was necessary to take some steps. Consequently they sought (the extreme believers in silver say conspired) to get possession of as much gold as possible, and then to induce the various nations of the world to demonetize silver, to make gold the only legal tender. Soon the promise of unlimited outflow of gold from the mines began to fail, and thus to vastly increase the value of their gold.

Gradually the arguments of English economists in favor of the single gold standard began to make impression, and this was deepened by indications that an excessive supply of silver from the Bonanza mines of Nevada might be expected. In 1867, in connection with the Paris Exhibition of that year, an international monetary conference was held at Berlin, and since even delegates from the United States, among others, supported resolutions advocating the demonetization of silver, the idea of gold monometalism spread.

The war of 1870–71, by securing to Germany a large sum of gold and merchantable paper equivalent to gold, in payment of the indemnity of $1,000,000,000 exacted from France, put Germany into a position to establish the single gold standard for herself. The law of Dec. 4, 1871, completed July 9, 1873, superseding the local coinage by an imperial coinage, demonetized silver by restricting its coinage to the amount regarded as necessary for change. The influence of Germany's action was felt in other quarters than the silver market, and its results everywhere had the effect of increasing the depression of silver. In 1873 Denmark, Sweden, and Norway followed her in adopting the single gold standard. Holland followed in 1875.

Silver Demonetized, 1873

In the United States, the influence of the bankers and capitalists had already caused the withdrawal of the greenbacks, the issue of interest-bearing bonds, the vote to pay both capital and interest in gold (altho in some cases it had not been promised to be paid in gold), and, besides all this, the gradual contraction of the currency; and thus, of course, the enhancement of the value of gold. (For the details, see CURRENCY.) Hitherto silver, since the beginning of the war at least, had played a small part in United States monetary affairs. During the war, and till about 1876, it was mainly a question of paper or gold. This led to unforeseen consequences. Silver—hitherto technically, altho not practically, a legal tender and standard of value—was, in 1873, technically demonetized.

(See CURRENCY.) A bill was introduced into Congress and passed Feb. 12, 1873, nominally to regulate details of coinage at the mint, but which, without mentioning the demonetization of silver, did practically accomplish this by not mentioning silver coins except for small change, and saying that no coins either of gold or silver should be coined except those therein set forth. It elicited at the time small attention. Few knew that it demonetized silver, and the most stalwart friends of silver voted for it. Silver was scarcely an issue.

But gradually, as the country saw the circulation contracting, and the opponents of contraction found that they could not obtain a paper currency, they turned to silver, and then discovered that it had been demonetized. The excitement was intense. Mr. Sherman and the few who knew what had been done were branded as traitors by the growing friends of silver. It was charged that demonetization had been carried by a conspiracy of a few Congressmen with the "gold kings" of Wall Street, to carry out "a world conspiracy" to demonetize silver and make gold the ruler of the world.

A monetary commission was appointed by Congress in 1876, which reported strongly in favor of silver, and led to the call of an international monetary conference at Paris in 1878, to secure the cooperation of the European powers in remonetizing silver. Meanwhile, the development of gold monometalism had gone on.

The Paris conference took no positive action toward silver remonetization. In the United States, however, the Bland Bill of 1878 did to an extent remonetize silver. It did not wholly, for altho, as originally reported by Mr. Bland from the House Committee on Coinage, it did propose the full remonetization of silver by authorizing its unlimited coinage at the ratio of 1 to 16 on private account, the bill, as finally passed, restricted coinage to $2,000,000 a month on government account. And the secretaries of our treasury, like the Bank of France, have been agreed in regarding their stock of gold alone as the reserve for the security of the notes they are obligated to redeem on presentation.

This was at length replaced in 1890, after almost annual attempts at a full free-coinage act, by a compromise measure, commonly known as the Sherman Act. This directed the treasurer to purchase silver bullion aggregating 4,500,000 ounces a month, or so much thereof as might be offered at market price, and to issue in payment for such purchases silver bullion treasury notes.

Meanwhile, on the Continent the gold monometalists had succeeded in permanently demonetizing silver. By an international agreement of the Latin Union in 1874, the coinage of silver had been limited; by an agreement of 1877 it ceased. The Paris conference of 1878 had been decided for gold.

We now come to the money crisis of the summer of 1893. The United States was left alone, of the great powers of the world, to deal with silver. Various events conspired to bring on this crisis. Losses on loans in the Argentine Republic compelled England to draw in her gold. Then came the failure of the Australian banks, demanding more gold from England. Austria-Hungary and Rumania decided to change to a gold standard. On the top of all this, the English Indian Government was induced (June 26, 1893) to stop the free coinage of silver. The crisis in America almost immediately followed. Silver dropt to the lowest point ever recorded. The day after the news from India, silver mines began to close in Colorado, and distress became intense. Meanwhile, some of the banks, not knowing what was coming, had begun a policy for which many of them dearly paid. It is claimed by silver extremists that the banks, or at least some bankers, planned, by reducing their circulation and by refusing credit, to create a slight pinch, to lay this to lack of confidence in the Sherman Act, and so compel Congress to repeal the Sherman Act and thus put the whole world in the hands of the triumphant gold metalists, as all the great powers, except the United States, were already. However, the banks did not know what elements were uniting to cause, not a slight pinch, but the worst monetary crisis the country had known for at least twenty years. President Cleveland was induced to summon an extra session of Congress to meet the emergency. It became impossible even for perfectly solvent manufacturing concerns to get enough money to pay their wages. Every device was used for money. Clearing-house notes were issued in large quantities. Banks in unprecedented numbers failed, altho with abundant assets, because they could not get currency to meet the demand. The calling of Congress (Aug. 7th) strengthened confidence temporarily. Large amounts of gold were obtained from England, and a little easement made. On Aug. 11th Mr. Wilson, of West Virginia, introduced a bill in the House, repealing the silver-purchasing clause of the Sherman Act, but renewing the pledge to maintain the parity of gold and silver. This passed the House by a vote of 240 to 110. Then came a long contest in the Senate. After much discussion in committee and caucus, Senator Vorhees introduced a bill, repealing the purchasing clause, but more strongly pledging the maintenance of bimetalism. Finally, however, after months of talk, it passed the Senate, was accepted by the House, and approved by the president Nov. 1st. Such is a brief outline of the monetary history from which the bimetalist controversy cannot be separated, and without a knowledge of which it cannot be understood.

Crisis of 1893

Since Nov., 1893, the bimetalist controversy has turned more upon fact than upon theory.

In this country, however, the bimetalists must not be confounded with those friends of silver who have fought for bimetalism, not from any theory or belief in bimetalism itself, but simply from a desire to expand or at least to prevent the contraction of the currency, and believing the use of silver to be the most available means to this end. By no means have all the supporters of silver in the Congressional battle been bimetalists. On the other hand, by no means have all the opponents of silver been monometalists. On the contrary, many of them believe in bimetalism, but have argued that the United States cannot afford to use depreciated silver when all the rest of the world is using gold. They have held that we must adopt the gold standard, and then work for an international agreement to use silver. It will be thus seen how complicated has been the condition of the bimetalic controversy in the United States. And this is but a brief statement of the subject. The intensity of feeling on the matter can only be realized when one reads the violent language of the friends of silver, classing the gold men with the most heinous traitors to the country, and threatening violence and war if silver be demonetized. This feeling can be understood only when one realizes what a contracting currency means, and how these men believe that the demonetization of silver is a deliberate plot to contract the currency. Says one writer:

Bimetalists and Free-Silver Men not the Same

All business and productive enterprises are a speculation. The farmer borrows money expecting to sell wheat at a certain price and pay his debt in money. Meanwhile the price of wheat falls 50 per cent. Where one bushel would have

paid his debt when contracted, it now requires two bushels, and the burden of the debt has grown 100 per cent. During the past twenty years this is exactly what has occurred. Our universal, all-important standard of measure has doubled. Every debtor and producing nation except the United States is a bankrupt nation. They borrowed money for private and public enterprises when prices were high, and must pay interest and principal when prices are low. Australia, with its bountiful resources and immunity from war; Egypt, Italy, Portugal, and the Argentine Republic are acknowledged bankrupts. France, Spain, and other nations escape the acknowledgment only by falsely doctoring their books. The reason is, the burden of their debts has nearly doubled. The people of the United States have paid two thirds of their war debt since 1865; yet, measured in wheat, cotton, corn, and many manufactured articles, it will require to-day more of the products of their muscle and brain to pay the remaining one third than it required in 1865 to pay the entire debt. Only a land of fabulous resources can endure this fruitless slavery. When we consider that the private debts of the country are one half the value of the country, it is no wonder that panic, depression, idleness, and despair are upon us.

In following the monetary history of the bimetallic controversy we have already seen many of the arguments *pro* and *con*; but as that history is confused with other questions, we tabulate here the main arguments for bimetalism.

Arguments for Bimetalism

1. That there is not enough gold produced in the world to do the business of the world, and that, therefore, unless silver or some other metal be used, the sufferings must be experienced which all economists are agreed would result from a contracting or insufficient currency.

2. Bimetalists argue that even if this be not the case, on general principles two metals are not so apt to fluctuate as one, and that if one metal be driven out of circulation temporarily, the other metal will remain, fluctuating perhaps, but still fluctuating less than the vanished metal. Jevons has illustrated this as follows:

> At any moment the standard of value is doubtless one metal or the other, and not both; yet the fact that there is an alternation tends to make each vary much less than it would otherwise do. It cannot prevent both metals from falling or rising in value compared with other commodities, but it can throw variations of supply and demand over a larger area, instead of leaving each metal to be affected merely by its own accidents. Imagine two reservoirs of water, each subject to independent variations of supply and demand. In the absence of any connecting pipe, the level of the water in each reservoir will be subject to its own fluctuations only. But if we open a connection, the water in both will assume a certain level, and the effects of any excessive supply or demand will be distributed over the whole area of both reservoirs. The mass of the metals gold and silver, circulating in western Europe in late years, is exactly represented by the water in these reservoirs, and the connecting pipe is the law of the seventh Germinal, An. xi. (1803), which enables one metal to take the place of the other as an unlimited legal tender.

3. Bimetalists claim that the depreciation of silver which has taken place has been due to unfavorable legislation, and that all the financial suffering which it has caused proves what need the world has of silver. If this goes on, they argue, nothing less than a most disastrous shock to the expansion of the world's commerce can be expected. And no remedy except the remonetization of silver has been suggested.

Arguments against Bimetalism

Contrary arguments come from two main sources: (1) From those who believe in a gold monometalism, and (2) from those who consider *both* monometalism and bimetalism to be faulty, and would meet the monetary need in other ways. The arguments brought by monometalists against bimetalism are very numerous and sometimes from such different standpoints that they seem contradictory, but may be summarized here. It is urged that, however we legislate, two metals cannot be a standard at the same time, because at any given time, according to Gresham's law (see MONEY), the poorer metal will drive the better metal out. If then, it is said, we attempt to have a double standard, it really means to choose the poorer standard of the two, and thus to have all the evils of a depreciated and depreciating currency. It is urged that the fall of prices has not been due to the appreciation of gold, as bimetalists assert, but to the cheapening cost of production. Monometalists point to the danger of there being such an increased production of silver as to threaten great depreciation of its value; and therefore, if accepted as a standard, the great lessening of money values, involving general financial ruin. The only way to prevent this, they urge, is to maintain gold as the most fixt and universally accepted measure of value, and then to use various forms of credit to do the exchange of the world where gold is not sufficient, using silver, copper, etc., only for subsidiary coin. Already, they assert, credit performs 93 per cent of the exchanges of the world. (Bimetalists deny this, and say that monometalists consider too much the methods of the financiering class. They say that the vast millions of the earth's population do not use forms of credit; that retail stores use it little, farmers still less, and artizans and day laborers scarcely at all. For these credit is no relief, since they have no credit. Credit, moreover, gives out when it is most needed, and throws the world back on an insufficient amount of gold just when gold is most in demand.)

The argument against bimetalism by those who would have neither bimetalism nor monometalism is (1) that bimetalism has not worked and cannot work without international agreement, and that this is well-nigh impossible to get, it always being the interest of the capitalists of one nation to adopt a gold standard if they can only induce some other nation to adopt a silver standard; (2) that the great need in currency is of a fixt standard, which, to remain fixt in proportion to prices, must be elastic in *volume*, which is possible neither with gold nor silver; so that we require some better system than either monometalism or bimetalism. (See MONEY.)

On Continental Europe, the most distinguished bimetalists have been: Henri Cernuschi, Prof. A. Wagner, A. Schaeffle, E. de Laveleye, and Baron von Kardoff; in England: Profs. Marshall, Sidgwick, Nicholson, Foxwell, and Symes, and the Hon. G. J. Goschen; in the United States: Henry C. Carey, President F. A. Walker, Hon. William D. Kelley, Hon. John P. Jones, John B. Howe, W. F. Balch, and Elisha B. Andrews.

Of the present, the situation is so involved that it is hard to speak. The large majority of professorial economists in this country are bimetalists in theory, but believe that to be successful international agreement is necessary; and they feel that this is at present impossible of attainment. In May, 1895, a significant bimetalic conference was held in London, but for all this recent history, see CURRENCY. See also CONTRACTION AND EXPANSION OF CURRENCY.

REFERENCES: The literature on the subject is very extensive, to a great extent in articles and letters in periodicals. The arguments on the subject will be found stated in Jevons, *Investigations in Currency and Finance*, London, 1884; *Money and the Mechanism of Exchange*, 1875; *Reports of Committee of House of Commons on Depreciation of Silver*, 1878; *Report of Commission on Trade and Industry*, 1886; and Appendix *B* to third *Report*, by R. BIOLOGY AND SOCIAL REFORM: The connection between biology and social reform is one which tends to be brought into greater prominence with the advance of knowledge. It is not long ago since the whole class of phenomena which human society presents was regarded apart in itself and as having little or no connection with those to be observed elsewhere in the history of life. The first consistent attempt on an extended scale to connect together through the principle of development and continuity both classes of phenomena was made by Mr. Herbert Spencer. "Social Statics," which in many respects may be regarded as the starting-point of the synthetic philosophy, dates back to 1850. One of the leading ideas in this system of philosophy—in which *First Principles*, *Principles of Biology*, *Principles of Psychology*, *Principles of Sociology*, and *Principles of Ethics* have been steps in an ascending series—has been to trace this principle of development up to and into human society. Toward the elucidation of the laws at work in this society, all the work of science in lower fields has been regarded as preliminary. It was, however, with the publication of Darwin's "Origin of Species" in November, 1859, that the greatest impetus was given to the study of human society from the biological standpoint. The full effect of this impetus is not yet felt in many departments of knowledge which are almost certainly destined to be eventually profoundly altered by it. For many years after the publication of this epoch-marking book the effect of the fructifying ideas which it contained was necessarily limited to a few departments of knowledge. Gradually, however, the circle of their influence has extended, until one after another of lower sciences, and particularly those connected with life, have been reconstructed and transformed. The principle of the continuity of development, structural and functional, is now well established; but in the long uphill battle which has had to be fought before the ideas connected with it obtained general acceptance, it has necessarily happened that the sciences connected with man in society have been the last to be influenced. But that they are now beginning to feel the effect of the revolution is evident. What we are coming to see is that in human society we have only the last and most complex chapter in the history of life. The historian, the political philosopher, the economist, and the student of ethical phenomena are all dealing with just the same problems, altho in different form, that science has been concerned with at earlier stages, and even to a large extent throughout the history of life. It is in the proposed solutions to problems connected with the distribution of wealth that we have at the present day the dividing lines which separate most of the various political parties into which our modern society is split up. It is with these problems, too, that the economist is largely concerned. Yet such problems in themselves constitute only an aspect of the highest and most complex phase of that struggle and rivalry of existence with which the biologist has already dealt on a lower plane. Some of the older economists, indeed, at times saw this more or less clearly. "Only through the principle of competition has political economy any pretension to the character of a science" was a dictum of John Stuart Mill. The point at which the social sciences tend to be most significantly influenced by biology may be indicated. What is becoming more clearly recognized is that, as biology would lead us to expect, the conditions affecting the distribution of wealth, which the evolutionary forces at work in human society are ever tending to develop, are not necessarily those that parties or classes desire for themselves, but rather those which are continually tending to produce the highest efficiency of the whole social organization. The old utilitarian ideal of the greatest happiness of the greatest number is not, therefore, always, or even often, the same as the ideal of the greatest utility. Thus in a sense the whole of the problem before modern socialism can be stated in biological terms: Is it a movement which is tending to produce the highest standard of social efficiency, or is it one the effect of which will be to produce the maximum of ease and comfort to the largest number of individuals? The lesson of biological science for society would appear to be that, so far as it produces the latter to the exclusion of the former, to that extent it must fail of ultimate success (but see EVOLUTION).

Breadth of the Subject

BENJAMIN KIDD.

BIRMINGHAM: City of Warwickshire, England; one of the chief industrial centers of England, and the leading hardware city of the world; population (1905) 542,959. It was an Anglo-Saxon town, and became an important industrial city even in the Middle Ages. Its great importance, however, dates from the seventeenth century, in the manufacture of swords and guns. As early as 1727 its hardware manufacturers are said to have employed 50,000 persons. By the end of the century it was known throughout the world. In the industrial revolution of the era of the eighteenth century it became a Liberal center, and in the nineteenth century a leader in reform and chartism. Evils, however, developed, and by 1873 Birmingham's municipal government was considered one of the worst in England.

In 1873 came a change. Mr. Joseph Chamberlain was elected mayor, and commenced an era of municipal activity. The sum of £2,000,000 was paid for the plant of two gas companies, a large price; yet the profits the first year were £34,000, and they have since doubled. The price, too, since 1875 has been reduced from 3s. to about 2s. per 1,000 feet. Since 1889 the employees have had the eight-hour day. In 1874 the city paid £1,350,000 for the existing water-works of a private company, and since then the works have been extended, the daily supply doubled, and the cost to consumers much reduced. In 1875 Mr. Chamberlain laid before the council an Improvement Scheme, which has since been adopted, and whereby the city took forty-five acres of the most crowded and most unwholesome portions of the city, covered by 1,368 houses, condemned the whole district, and has opened in its place the

finest public thoroughfare of the city, "Corporation Street," lined by fine business blocks. These buildings have not been sold, but leased for seventy-five years. The gross outlay April, 1904, was £1,730,303, but the yearly cost is lessening and the rentals are growing. In fifty years from the time of the investment the debt will all have been paid, and the city will own these structures in clear title. Mr. Chamberlain believes that Birmingham will be the richest municipal corporation in the kingdom. The investment already pays, since the death-rate of this district has been lowered, from 60 to 20 or 25 per 1,000. The city has developed a fine sewerage system and a large sewage farm, a wholesome and agreeable tract of land under high cultivation and with rich crops. Birmingham was the first city in England to establish municipal baths. The first was opened in 1851, at a cost of £24,000, and there are now four, besides swimming-baths, Turkish baths, etc. The city has laid and owns several lines of tramway, within the city limits, but leases them to private companies on favorable terms. It is calculated that in twenty-one years this will pay for the whole investment. As the city can borrow at 3 per cent, it is a profitable investment. The companies have to pay all bills for maintenance and repairs, and are minutely supervised as to the furnishing and lighting of the cars. The city owns her own markets, having bought them of the manorial lord in 1824, and they now yield some £10,000 a year profits. The city owns more than ten parks, for its population of 500,000. Its debt, which before Mr. Chamberlain became mayor was small, is now some £15,000,000, but it has assets of £16,000,000, and the rates are almost exactly what they were in 1873.

Improvement Scheme

In 1899 the electric plant was also municipalized. In 1896 a municipal technical school was erected at a cost of £100,000; it has some 3,000 pupils. The city has other schools, colleges, art school, galleries, etc. Queen's College is connected with the London University. The municipal government is conducted by fifty-four councilors and eighteen aldermen. The councilors are elected once for three years, one third going out of office each year. The aldermen are elected by the council for six years. The city has a lord mayor who is elected annually by the council. Birmingham is now often spoken of as "the best governed city in the world."

Government

BIRNEY, JAMES G: Abolitionist; Presidential candidate of the Liberty Party (1840 and 1844); born in Danville, Ky., 1792. Originally a slaveholder, and at one time agent for a colonization society, in 1834 he freed his slaves and established an abolition newspaper. Fear of violence compelled him to leave Danville, and subsequently Cincinnati whither he had moved. He came to New York, where he was Secretary of the American Anti-Slavery Society. In 1842 he moved to Michigan, and a fall from his horse disabled him from further political activity. He died in 1857.

BIRTH-RATES: In nearly every civilized country, the numbers of births and deaths are matters of careful record. Unfortunately, however, this is not true of the United States as a whole. The U. S. census calls "registration areas" districts where there are adequate official returns; and the only states whose records were accepted as accurate by the census of 1900 were Massachusetts, Connecticut, Rhode Island, and New Hampshire, in addition to certain counties and cities of New York and New Jersey. In Europe, however, registration has been in the main complete, beginning with England in 1838. The following tables, except where otherwise indicated, are taken from reports of the Registrar-General of England:

Birth-rate per 1,000 Inhabitants[1]

Country	1841–50	1851–60	1861–70	1871–80	1881–90	1891–1900	S. J.[2]
Austria	37.6	36.9	38.2	39.0	37.9	37.1	(1903) 35.0
Belgium	30.5	30.4	32.2	32.7	30.2	28.9	(1903) 27.5
Denmark	30.5	32.8	30.7	31.5	31.9	30.2	(1904) 29.2
England and Wales	32.6	34.2	35.4	35.5	23.5	30.0	(1904) 28.0
France	27.2	26.2	26.1	25.4	23.9	22.1	(1904) 20.9
Germany	36.1	35.3	37.2	39.1	36.8	36.1	(1904) 34.1
Norway	30.7	30.0	30.9	30.9	30.8	30.4	(1904) 27.9
Sweden	31.1	32.8	31.4	30.5	29.0	27.1	(1903) 25.7

[1] From *Statistik des Deutschen Reichs*, cl., 1903.
[2] *Statistisches Jahrbuch für das Deutsche Reich*, 1906.

This table and the following indicate a slowly but steadily decreasing birth-rate. The United States had a birth-rate of 31.5 in the census year of 1880, tho all census birth-rates are admittedly too low. For 1890 it was 26.68. The birth-rate for 1900 was 27.2. Few of the states publish records of births. The birth-rate for Connecticut averaged 23.6 for 1850–60; 22.7, 1861–70; 24.6. 1871–80; 23.0, 1881–90; 24.1, 1891–1900, and 22.4 for 1901–2. In Rhode Island, owing probably to immigration, the birth-rate has somewhat

risen. In 1870 it was 24.0; in 1880, 22.9; 1890, 24.7; 1900, 25.8. In Massachusetts it has fallen. It was 28.08 in 1851; 29.28, in 1860; 26.25, in 1870; 24.80, 1880; 25.81, 1890; 26.16, 1900, and 24.58, 1902.

BIRTH-RATE PER 1,000 INHABITANTS

COUNTRY	1857–99	1900	S. J.[1]
Austria	38.0	....	(1903) 35.0
Belgium	30.1	28.9	(1903) 27.5
Denmark	31.3	29.8	(1904) 29.2
England and Wales	32.3	28.7	(1904) 28.0
France	23.7	21.4	(1904) 20.9
Germany	37.2	35.6	(1904) 34.1
Hungary	42.9	39.3	(1903) 36.6
Ireland	23.8	22.7	(1904) 23.6
Italy	36.6	32.9	(1903) 31.5
Norway	30.7	30.1	(1904) 27.9
Prussia	37.7	36.1	....
Scotland	32.2	29.6	(1904) 28.6
Spain	(1888-99) 35.6	34.4	(1902) 35.6
Sweden	28.7	26.9	(1903) 25.7
United Kingdom	31.1	28.2	....

Concerning the cause of the decreasing birth-rate, the position of MALTHUS is well known. Tho attacked by GODWIN it became universally accepted. Herbert SPENCER agreed with Malthus, but held that the very fact that population tends to increase beyond the means of subsistence is the cause of human progress. He argues that the progress of civilization, produced by the never-ceasing pressure of population on the means of subsistence, leads to a diminishing birth-rate. More modern discussions of the subject have been led by Dr. George Hansen in Germany; M. Levasseur, M. Leroy-Beaulieu, and M. Dumont in France; Dr. George Blundell Longstaff and Dr. J. Milner Fothergill in England; Dr. John S. Billings, Dr. Cyrus M. Edson, and others in the United States.

Levasseur[1] argues that inequalities of production are the cause of changes in the increase of population. M. Dumont[2] argues that, tho on the surface the decrease of population is an economic question, at bottom it is intellectual, political, and esthetic; that as the desire to rise in the industrial, intellectual, political, or esthetic world increases, the birth-rate diminishes. Dr. Hansen,[3] Dr. Longstaff,[4] and Dr. Fothergill,[5] show especially the evil influences of city life upon the population, both in weakening the vitality and in diminishing the birth-rate. Says J. L. Brownell (*Annals of the American Academy*, July, 1899):

> The generalizations tentatively reached by all these inquirers are that civilization in general checks the rate of increase of population, in spite of a diminishing death-rate; that city life is, on the whole, unfavorable to the natural increase of population, and that what the economists call the "raising of the standard of life" operates in the same way.

It has been assumed that the changes in the marriage-rate and the marriage age will account in a great measure for the decreasing birth-rate; but another explanation is more than hinted at in the following quotation from Dr. John S. Billings:[6]

> It is probable that the most important factor in the change is the deliberate and voluntary avoidance or prevention of child-bearing on the part of a steadily increasing number of married people, who not only prefer to have but few children, but who know how to obtain their wish.

M. Levasseur and M. Dumont hold the same opinion. Says the former:

> "By prevision we understand the human will restraining or directing the reproductive instinct, with a view to bringing children into the world only at such times and in such numbers that the father can hope to support them and to educate them for a position equal to his own. Prevision is the characteristic of the man who reflects, and who, conscious of his responsibilities, does not leave his destiny to chance. This virtue is the palladium of human liberty. The philosopher and the economist who believe in that liberty ought, if they are logical, to recommend such prevision, recognizing that if it is useful in the great mass of actions, it is nowhere more opportune than in the grave question of the growth of the family and the education of the child. . . . It is enough to lay down as a general rule that reason should control instinct." M. Dumont says: "The real cause of the decrease of our birth-rate is the wish to have few or no children, and that wish is determined by a combination of intellectual, moral, and esthetic tendencies peculiar to our people."

Voluntary Prevention

Dr. Cyrus M. Edson[7] agrees with Dr. Billings that "the voluntary avoidance and prevention of child-bearing is steadily increasing," but thinks that the principal cause is the physical and nervous deterioration of the women of the United States; and this, he asserts, is largely due to the severe strain of modern life and education. In fact, any one who is at all familiar with the statistical and medical literature of the subject is aware that the voluntary prevention of conception is the explanation of the diminishing birth-rate that is generally accepted by physicians and statisticians.

Comparing the statistics of Europe for 1896 and the U. S. 1890, the countries with the highest birth-rates were Russia, Hungary, and Austria; and those with the lowest, France, Ireland, the U. S., and Sweden. Birth statistics are evidently affected by the extent to which prevention of births is practised in different countries, but generally speaking the more uncivilized the race, the higher the birth-rate. In India the birth-rate is said to be 48. In the U. S. in 1890, it was 26.35 for whites, 29.07 for colored, and 38.29 for whites with both parents foreign.

A large excess of the birth-rate over the death-rate, such as exists in England and in Germany, constitutes an undoubted element of national strength. In France the excess of births over

[1] Levasseur, *La Population Française*, iii., pp. 27, 218–20, 223.

deaths has been constantly diminishing, until in 1890 there was an excess of deaths over births. This condition is viewed with alarm by intelligent French writers, and is termed by M. Cheysson a "national peril." He states as among the causes of the low birth-rate of France, "the growth of large towns, debauchery, overcrowding in manufacturing centers, the French law of inheritance, and the 'moral restraint' of Malthus, practised not by the poorer class, who are prolific, but by the well-to-do classes, who are systematically sterile."

Birth-rates also undoubtedly vary with economic conditions. Von Meyr showed that births in Bavaria from 1835 to 1860 rose and fell diversely with the price of rye.

BIRTHS PER 1,000 WOMEN OF VARIOUS CLASSES, 15–50 YEARS OF AGE[1]

CLASSIFICATION.	Paris.	Berlin.	Vienna.	London.
Very poor quarters	108	157	200	147
Poor quarters	95	129	164	140
Comfortable quarters	72	114	155	107
Very comfortable quarters	65	96	153	107
Rich quarters	53	63	107	87
Very rich quarters	34	47	71	63
Average	80	102	153	109

Mrs. L. K. Commander, in her recent book, "The American Idea" (1907), has collected a large amount of testimony in regard to the situation in the U. S., and thus sums it up:

(1) The size of the American family has diminished.
(2) The decline is greatest among the rich and educated, but also exists to a marked extent among the middle class and the intelligent poor.
(3) Only the most ignorant and irresponsible make no effort to limit the number of their children.
(4) Not only has the large family disappeared, but it is no longer desired.
(5) The prevailing American ideal, among rich and poor, educated and uneducated, women and men, is two children.
(6) Childlessness is no longer considered a disgrace, or even a misfortune, but is frequently desired and voluntarily sought.
(7) Opposition to large families is so strong an American tendency that our immigrants are speedily influenced by it.
(8) The large family is not only individually, but socially, disproved, the parents of numerous children meeting public censure.

She says that of thirty-eight physicians in New York City replying to questions, thirty said "two children" was the ideal American family; six said "one child"; one said, "having a family is not an American ideal." President Eliot of Harvard University finds that of six classes more than twenty-five years out of college, the number of children surviving born to members of those classes averaged almost exactly two to a family; while twenty-eight per cent are unmarried. Professor Thorndike of Columbia University found that of the women college graduates of Vassar, Smith, and Wellesley, from 1880–84, 55 per cent were married (up to 1903), while of graduates from 1898 to 1899, only 5.5 per cent were married (up to 1903). He says that 45 per cent of all women college graduates marry, while of the general female population who reach the age of forty, 90 per cent marry (*Popular Science Monthly*, May, 1903).

The organ of the New York Church Federation (*Federation*) says that religious belief strongly affects the birth-rate. "The maximum (family in New York) is Hebrew; the minimum agnostic. The Roman Catholic average is higher than the Protestant; the positively Protestant than the indefinitely Protestant; the indefinitely Protestant than the definitely agnostic."

BISMARCK, OTTO EDUARD LEOPOLD, PRINCE VON: First chancellor of the German Empire; born at Schönhausen, Prussian Saxony, 1815; studied law at Göttingen, Berlin, and Greifswald; elected to the Prussian Landtag (1847), as an ultra-royalist. In 1851 he was chosen a member of the Germanic Diet at Frankfort and continued as such till 1859, acquiring fame as an opponent of revolution, and as an advocate of a German empire under the lead of Prussia. In 1859 he was sent as minister to Prussia, and in 1862 to Paris. The same year, however, he was recalled to take the Prussian portfolio of foreign affairs. He closed the chambers, and for four years governed without them. Bismarck used the Sleswick-Holstein controversy, the defeat of Austria by Prussia at Königgrätz (Sadowa), and above all the Franco-Prussian War, which he is believed by many largely to have caused, to build up a feeling of national unity in Germany, with Prussia in the lead. King William was crowned emperor over a united Germany at Versailles on Jan. 17, 1871, and Bismarck was made a prince and a chancellor of the empire. He compelled France to cede Alsace-Lorraine and to pay an indemnity of $1,000,000,000, and then sought to develop the empire by a foreign policy of alliances against France, by building up a strong army and navy, by a high protective tariff, and by developing state monopoly. He thus became opposed both by the Liberals and by the Ultramontanes. In 1872 he expelled the Jesuits and began the so-called "kulturkampf" or contest with Rome. Against the growing power of the Socialists, he enacted strict repressive laws, at the same time fostering the paternal socialism which has had such large development in Germany.

From 1879 at least Bismarck was considered almost the leading spirit of paternal State socialism. This, however, was not to adopt a new policy in Prussia, but simply to carry out, or, rather, revert to the traditional policy of the Hohenzollerns. (See GERMANY.) It was the proud boast of Frederick the Great that he was *le roi des gueux*. Of all the governments of the seventeenth century, the Prussian was the first to seek the welfare of the whole community. The Prussian *landrecht* recognizes the State as the protector of the poorer classes, and one of its duties to supply sustenance and work for those lacking means and opportunity of earning a livelihood. It was upon these clauses that Bismarck relied when, on May 7, 1884, he declared to the Reichstag his recognition of the laborer's right to work. His drastic law against socialistic meetings and writings dates from 1878. In that year two attempts on the life of the emperor enabled Bismarck to carry through a drastic bill of repression which was rigidly enforced until its failure to be renewed upon its expiration by limitation of time.

State Socialism

Bismarck's State socialism thus seems to have come from mixed motives—partly to take the ground from under the real Socialists, partly, perhaps, from religious motives, mainly to serve and aggrandize the house with which he was so long identified. The religious flavor is not lacking. As early as 1847 he spoke and voted in the United Diet for a State loan to a private railway enterprise, and from that time forward, whether as private deputy or as minister, he never failed, when opportunity occurred, to promote the close connection

of the State and the railways, always keeping in view the ultimate end of a thoroughly nationalized system of railway communication. This he finally accomplished. (See RAILROADS.) He also established State monopolies in brandy and tobacco. When it was objected in the Reichstag in 1882 that his monopoly projects savored of socialism, he did not deny the imputation, but welcomed it, observing: "Many measures which we have adopted to the great blessing of the country are socialistic, and the State will have to accustom itself to a little more socialism yet. We must meet our needs in the domain of socialism by reformatory measures if we would display the wisdom shown in Prussia by the Stein-Hardenberg legislation respecting the emancipation of the peasantry. That was socialism, to take land from one person and give it to another—a much stronger form of socialism than a monopoly. But I am glad that this socialism was adopted, for we have as a consequence secured a free and very well-to-do peasantry, and I hope that we shall in time do something of the sort for the laboring classes."

Bismarck's return to the principles of protectionism, which movement he commenced in 1877, he also made largely for reasons of State socialism. In 1890, due to a divergence of view with the young emperor, Bismarck resigned his chancellorship and retired to his estates, tho still retaining some influence in the empire and in all Europe. He died in 1898.

BLACK, JAMES: The first candidate of the Prohibition Party for President of the United States; born in Lewisburg, Pa., 1823. Removing with his parents to Lancaster, Pa., in 1836, he worked in a sawmill, until in 1841 he entered the Lewisburg Academy. In 1844 he began the study of law, and in 1846 was admitted to practise at the bar in Lancaster, where he resided all his life. In 1840 he joined the Washingtonians, the first temperance organization in his neighborhood. It was largely due to Mr. Black's personal efforts that the Maine law movement became popular in Lancaster County and resulted, in 1855, in the election of two of the five temperance legislative candidates. He was a Republican in politics until the formation, in 1869, of the National Prohibition Party. At the convention of that party in 1872 Mr. Black was nominated as its candidate for President of the United States, and received 5,608 votes. For the four years from 1876–80 he was Chairman of the National Committee of the Prohibition Party. He was one of the founders of the National Temperance Society and Publication House. Black was the author of: "Is there a Necessity for a Prohibition Party?" (1875); "Brief History of Prohibition" (1880); and "History of the Prohibition Party"(1885). He died in 1893.

BLACK DEATH, THE: The pestilence, or series of pestilences, known by this name took place in the middle of the fourteenth century, and was a partial, if not the chief cause, of vast economic changes in England. So far as can be ascertained, the disease first manifested itself in central China in 1333, and thence spread in a westward direction toward Europe, where its force was first felt in the southern countries.

It appeared first in Italy, then crossed western Europe, and arrived at the English ports of Bristol and Southampton in the summer of 1348. Whole districts were depopulated by its frightful ravages, and altho the old chroniclers give grossly exaggerated estimates of the number of deaths, it is probable that it carried off at least one third of the population. The scenes of horror and desolation which it caused beggar all attempts at description.

One immediate result of the plague was a great scarcity in the number of available laborers, because, while all classes had suffered heavily, the poorest had yielded most rapidly to the dire disease. This scarcity of labor meant, of course, higher wages for the laborer. In the case of agricultural workers, this rise amounted to about 50 per cent, while in the case of skilled artizans, such as carpenters and masons, the same effect was felt, often more markedly. The nobles and landlords objected, and, without waiting to call Parliament together, the king issued a proclamation ordering all men to abide by the rates which had been customary before the Black Death, and neither to demand nor pay higher wages. He also forbade laborers to leave the land to which they were attached, and assigned heavy penalties for so doing. Parliament met in 1349 and made haste to ratify this proclamation by reducing it to the form of a statute—the famous "Statute of Laborers"; but such legislative measures were hopeless against the demand for workers, and the very men who passed these laws were obliged to break them to prevent their land from remaining untilled. The peasants went freely into those districts where workers were most scarce, and found ready shelter and good wages. Complaints were constantly made to Parliament, and the "Statute of Laborers" was again and again enacted with added penalties, but to no purpose.

In spite of the great rise in the price of labor the price of the laborer's food did not rise in proportion. Food did not require much manual labor in its production, and hence the rate of wages was not much felt in its price. What did rise was the price of all articles which required much labor in their production. The landlords were obliged to let their estates to tenants who worked them on their own account, paying rent to the lord, instead of, as formerly, compelling villeins to work them for the master's profit. Thus serfdom practically came to an end. The gain was not all on one side, however, as the peasants began at this time to lose those rights in the "commons" and forests which until then they had enjoyed.

Another of the important effects of the Black Death was the spirit of independence which it helped to raise in the breasts of the peasants, who now began to feel their power. The new spirit led to the preaching of John BALL, the PEASANTS' REVOLT, and the Golden Age of "Merrie England." The revolt was put down, but the victory really lay with the vanquished; and from this time serfdom practically disappears from English history, and wages remain high till the robbery of the land by the landlords in the sixteenth century.

BLACK LIST: A list published or prepared by any body of men of the names of those whom they consider faulty in any way. The term is specifically used of official lists of insolvents and defaulters. In industrial discussions it is used of lists of employees who for one reason or another—perhaps because of having led in labor agitation—employers will not employ. It is used also of lists of firms which are believed to treat their employees unfairly, and which, therefore, the preparers of the black list believe should not be patronized by the friends of fair treat-

ment. (See BOYCOTTING; also WHITE LIST.) The blacklisting or asserted blacklisting by employers of their employees who have been active in the cause of labor has been a fruitful source of complaint on the part of labor organizations. Says John Mitchell:

> Labor leaders and men interested in the labor movement have always been a shining mark for the black list. Many a man has been hounded from position to position, driven as by an invisible wind from one part of the country to another, ceaselessly wandering, ceaselessly asking for positions, doomed inevitably, after the shortest term of service, to be dismissed upon some trumped-up charge. There is nothing so terrible as this weapon of associated employers. Many a man has been driven to change his name and even to alter his appearance in the vain hope of escaping from the omnipresent and omnipotent black list ("Organized Labor," p. 291).

The black-list evil is somewhat diminished, as legislation in England and in many states of the United States has forbidden blacklisting, at least in some of its worst forms, and as a growing sense of justice has to some extent defended the laborer and even the labor agitator; and, above all, as the practise of collective bargaining between organized labor and organized capital has replaced the personal bargain. Nevertheless, blacklisting still exists. It was testified in blacklist cases at Chicago that fully half the men who went out in the great railroad strike of 1894 failed to get railway employment again. In the recent Colorado troubles, the black list was widely used. It is easy for employers to avoid the law and, by minute systematic inquiries as to former places of employment and reasons for disgrace, practise a very complete blacklisting. Some employers are even said, in letters of recommendation to discharged employees, to put secret marks showing that they are blacklisted; yet the case is difficult, because employers must of necessity know the references and character of those they employ, especially when the question is of places involving responsibility, or perhaps of safety to life and limb.

In the U. S. blacklisting is prohibited in Alabama, Arkansas, Colorado, Connecticut, Florida, Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Montana, Nevada, North Dakota, Oklahoma, Oregon, Texas, Utah, Virginia, Washington, and Wisconsin. In the case of common carriers engaged in interstate commerce, the federal law on the arbitration of labor disputes makes it a misdemeanor for an employer to attempt or conspire to prevent an employee from obtaining employment after quitting his service. But the laws have many exceptions and are difficult to enforce. Judge Rogers, in the U. S. Circuit Court, August, 1903, refused an injunction against blacklisting, and held that an employer may give to another employer lists of his discharged men with the reasons for their discharge, provided it be honestly done.

BLACKWELL, ALICE STONE: Writer; woman suffragist; born in Orange, N. J., 1857; daughter of Lucy Stone and Henry B. Blackwell. She graduated from Boston University in 1881, and since then has been on the staff of the *Woman's Journal* of Boston, Mass. She has been a prolific writer on woman's suffrage. *Address*: 3 Park Street, Boston, Mass

BLACKWELL, ELIZABETH: First woman to receive a medical diploma; born in Bristol, England, 1821. Her father emigrated to New York, and from there to Cincinnati in 1838, where he died, leaving a widow and nine children. The father had left but little money, and Miss Blackwell therefore opened a boarding-school. She was only eighteen years of age, but her school succeeded. In 1844 Miss Blackwell, whose energetic spirit had long been restless under the limitations which society imposed upon women, determined to enter the medical profession. For three years she taught in another school, in order to obtain means for a medical course, and then applied for admittance into the Philadelphia medical schools. She was everywhere refused. After a course of private lessons under medical professors, she finally obtained admission to the University of Geneva, N. Y., where she remained for two years, graduating with the highest honors. Her propriety and discretion won for her the esteem of students and professors alike. After graduation she visited England and France, and studied for some time longer. In 1851 she returned to New York and began the practise of medicine. At first other physicians refused to consult with her; but she overcame all obstacles and secured a large practise. In 1854, with her sister, Dr. Emily BLACKWELL, she established the New York Infirmary for Women and Children. In 1869 she went to London, where she established the National Health Society, and aided in organizing the London School of Medicine for Women. In 1878 she settled in Hastings, England, working and writing on social purity, municipal reform, the health and education of women, and other social matters. *Address*: Rock House, Hastings, England.

BLACKWELL, EMILY: Physician; philanthropist; born in Bristol, England, 1826; sister to Elizabeth BLACKWELL; came to the United States in 1832. She commenced studying medicine in 1848, but was refused admission to the medical colleges, and only allowed to attend lectures for a period in two others, till finally she was admitted to the medical college in Cleveland, O. Graduating triumphantly, she studied in hospitals and attended clinics in Edinburgh, Paris, and London. She returned to New York in 1854, and in connection with Dr. M. E. Zakrzewska (a Polish lady), established a hospital which in 1865 was given college powers. A woman's college, it has been and still is a marked success. Dr. Blackwell was one of the vice-presidents of the Society for the Promotion of Social Purity, and is the author of many tracts upon this and similar subjects. (See SOCIAL PURITY.) *Address*: Montclair, N. J.

BLAKE, LILLIE DEVEREUX: Writer; lecturer; woman suffragist; born in Raleigh, N. C., 1835. Her father dying in 1837, his widow removed to New Haven, and Miss Devereux was educated there by private tutors. In 1855 she married Frank G. Q. Umsted, a young lawyer, and resided in St. Louis and New York City, till she was left a widow with two children in 1859. She had already written stories, and published a successful novel, "Southwold." She now entered literature as a profession, residing in Stratford, Conn., New York City, and Washington. In 1866 she married Mr. Grenfill Blake, a young New York merchant, and made her home in that city.

In 1869 she became interested in the woman's-suffrage movement, and wrote and lectured continually. From 1879 to 1890 she was president of the New York State Woman's Suffrage Association. She has been active in the agitation for police matrons and for laws for the benefit of saleswomen, etc. She has written a volume of lectures entitled, "Woman's Place To-day." *Address*: 100 Lexington Ave., N. Y.

BLANC, JEAN JOSEPH LOUIS: Writer; communist; born in Madrid, 1811. In 1830 he went to Paris and became clerk in an attorney's office. Two years later he went to Arras to act as tutor. Returning to Paris, he founded, in 1839, the *Revue du Progrès Politique, Social et Littéraire*. In this he brought out his work "L'Organisation du Travail," which may be called a French forerunner of Karl Marx's "Das Kapital." In 1841 he published his "Histoire de dix Ans," which was an overwhelming indictment of Louis Philippe and his ministers, and in 1847 the first two volumes of his "Histoire de la Révolution Française" appeared. The revolution which broke out early in the next year compelled him to delay the completion of this work. His popularity among the Parisian workmen secured him a seat in the Provisional Government, where he brought forward the proposals for universal suffrage and the abolition of slavery. He was also appointed president of a government commission for laborers. In March a procession of 200,000 workmen, headed by Blanqui, offered him the dictatorship, which he refused. The Provisional Government established the Ateliers Nationaux which he had advocated, but they were started on such unsound principles that Louis Blanc opposed them and demanded their abolition. He even charged the government with plotting their failure. In June and again in August, 1848, he was accused in the Assembly of complicity in the Communist outbreak of May. Being condemned by a large majority he fled to England, where he stayed in exile for more than twenty years, finishing his "Histoire de la Révolution Française" and writing his "Histoire de la Révolution de 1848" and other works. In 1870 he returned to Paris and urged the citizens to prosecute the war to the uttermost. Till the time of his death he was elected deputy for Paris, always voting with the extreme Left. He died in 1882.

BLAND, HUBERT: Author; Socialist; born at Woolwich, England, 1856; educated for the army, but on the death of his father took to finance, and at the age of twenty-three was manager of a foreign bank in London. In 1886 he entered journalism chiefly as a critic in art and literature. He was one of the founders of the Fabian Society, has been its treasurer from the beginning, and is the only member who has been continuously on its executive committee. Mr. Bland is a regular contributor to *The London Chronicle* (daily and Sunday), and occasionally to *The National Observer* and *The Saturday Review*. In collaboration with Adeline Serjeant, he has written "A Modern Friendship." Mrs. Bland (E. Nesbit), the well-known novelist and poet, cooperates with her husband in much social reform work. *Address*: Well Hall, Eltham, Kent, England.

BLANQUI, JÉRÔME ADOLPHE: Professor of political economy; born 1798; brother of Louis Auguste Blanqui. From 1830 to his death he was the head of the École de Commerce of Paris, and in 1833 replaced J. B. Say as professor of political (and especially of industrial) economy at the Conservatoire des Arts et Métiers. In 1838 he was elected a member of the Académie des Sciences Morales et Politiques, and represented the department of the Gironde in the Chamber of Deputies. His teaching in political economy was liberal and progressive. By no means a Socialist, he yet favored many socialistic principles. The brilliancy and vigor of his language is another characteristic which has aided him much. The most important of his works are: "Résumé de l'Histoire du Commerce et de l'Industrie"; "Précis Élémentaire d'Économie Politique"; and "Histoire de l'Économie Politique en Europe, Depuis les Anciens jusqu'à nos Jours, Suivie d'une Bibliographie Raisonnée des Principaux Ouvrages d'Économie Politique." This last work has been translated into several languages. Tho not of the greatest merit, it has done important pioneer work. Blanqui died in 1854.

BLANQUI, LOUIS AUGUSTE: Communist; Socialist; born at Puget Théniers, 1805; came to Paris in 1824 and became a teacher and student of law and medicine. On the breaking out of an insurrection in 1827 he joined the cause of the people, thenceforth taking his part in every Paris insurrection. He edited *Le Journal de la Société des Amis du Peuple*, and for this was imprisoned. Implicated in various conspiracies, he was, in 1836, sentenced to two years' imprisonment, but was pardoned in 1837. In 1839 Blanqui organized another insurrection, which was quickly put down, and he was condemned to death, but the sentence was changed to imprisonment for life. Confined at Mont Saint Michel, and at Tours, he was freed by the February Revolution of 1848. By Feb. 25th he was in Paris organizing the Central Republican Committee. On May 15th he was captured and imprisoned for ten years at Belle Isle and in Corsica. Amnestied in 1859, he was, in 1861, accused of conspiracy and imprisoned four years. When the republic was proclaimed (September, 1870) he went to Paris and advocated the principles of the extreme Left, publishing his "La Patrie en Danger." After the Commune he was arrested by Thiers, and (1872) condemned to deportation; but on account of ill health was held in Quélern and Clairvaux, until he was pardoned by Grévy, June 9, 1879. He was elected deputy in Bordeaux in 1879, but was declared ineligible. A mystic, a revolutionist, an autocrat, Blanqui was no mean thinker, and a convinced communist. Author: "L'Éternité dans les Astres", "L'Armée Esclave et Opprimée"; "Critique Sociale," etc. He died in 1881.

BLATCHFORD, ROBERT P.: Author; Socialist; born at Maidstone, England, 1851; apprenticed to a trade in Halifax, 1864, serving seven years. In 1871 he joined the army and served till 1877. Obtaining work as timekeeper and clerk at 30 shillings a week, he married in 1880. He began writing soon after, contributing to *The Yorkshireman* and *Toby*. In 1885 he removed to London to join the staff of *Bell's Life*, and wrote for *The Sunday Chronicle* at its start in August, 1885, under the *nom de plume* of "Nunquam." He soon declared himself a Socialist, and in 1891, refusing to restrain his pen, he left *The Sunday*

Chronicle, and soon after issued the first number of *The Clarion*, in whose pages his history has since been written. In 1891 he was named as parliamentary candidate for East Bradford, but soon withdrew, having no taste for politics. He originated the "Fourth Clause," which practically laid the foundation of the Independent Labor Party. It reads, at present, substantially as follows: "That all members of the I. L. P. pledge themselves to abstain from voting for any candidate for election to any representative body who is in any way a nominee of the Liberal, Liberal Unionist, Irish Nationalist, or Conservative parties." His "Merrie England," a series of letters on socialism, which first appeared in *The Clarion*, is now sold complete for a penny, and has reached a sale of well over a million copies. *Address*: Clarion Office, 72 Fleet Street, E. C., London, England.

BLIND, KARL: Revolutionist; born at Mannheim, Germany, 1826. While a student in Heidelberg and Bonn, he began to organize revolutionary societies. In 1847 he underwent a short imprisonment for a tract, "German Hunger and German Princes." In the revolutions of 1848 he played a prominent part at Carlsruhe and Frankfort. He escaped to Alsace, but took part continually in revolutionary uprisings till he was compelled to flee both from Germany and France. He took up his residence in England, and wrote much on literary and political subjects. His views favored national as opposed to international socialism, and socialism as opposed to anarchism. He was a firm and strong supporter in 1870 of the movement for German unity.

BLIND ASYLUMS: See Deaf and Blind.

BLISS, WILLIAM DWIGHT PORTER: Born in Constantinople, Turkey, 1856; son of an American missionary; studied in Robert College, Constantinople; Phillips Academy; Amherst College; and Hartford Theological Seminary. He was settled over Congregational churches in Denver, Col., and at South Natick, Mass. In 1885 he became interested in socialism through seeing the workmen in factory villages and reading Henry George and the *Christian Union*. In 1886 he entered the Episcopal Church, and took a charge at Lee, Mass. Here he joined the Knights of Labor; was Master Workman of the Assembly at Lee, and in 1887 sent to Cincinnati as delegate from the Knights of Labor, being one of the secretaries of the Union Labor Convention. The same year he helped start, with Father Huntington, the Church Association for the Advancement of the Interests of Labor (Cail). In 1888 he took charge of Grace Church, South Boston. He was nominated for Lieutenant-Governor of Massachusetts by the Labor Party, but declined. He was one of the founders of the first Nationalist club in Boston in 1889, and soon after, with other clergymen, organized the Society of Christian Socialists. He started *The Dawn* and published it until 1896. In 1890 he established the Christian Socialist (Protestant Episcopal) Church of the Carpenter, which was kept up till 1896. Mr. Bliss also lectured or preached for the Christian Social Union, presenting the cause of Christian Socialism in almost every state of the Union, and lecturing also in Canada and England. He has had parishes at Alhambra, Cal., 1898–99, and at Amityville, L. I., N. Y., 1902–6. President of the National Social Reform Union (1899), Secretary of the New York Civic Council (1900). In 1906 he helped organize The Garden Cities Association of America and became its secretary. His views are those of Christian socialism. Author: "Handbook of Socialism" (1895), and numerous tracts and magazine articles on Christian socialism. Editor of "Social Science Series"; "Encyclopedia of Social Reform" (1898 and 1907); and with Dr. Josiah Strong, of "Social Progress." *Address*: 1 Madison ave., New York.

BLOCH, JEAN DE: Polish writer on peace; born at Radom, 1836, of Jewish parentage. He became government administrator of railways; was active in promoting various Polish industrial movements; and was the head of large lumber and sugar interests, but constantly engaged in philanthropic efforts for the poor. To the world he became known largely by his magazine articles in behalf of universal peace, and by his great work in seven volumes, published in St. Petersburg, 1887, and translated in abridged form into English, first under a fuller title, but in 1899 under the name "Is War Now Impossible?" He died in 1902.

BLOCK, MAURICE: Economist; statistician; born at Berlin, 1816; studied in Paris and in Germany. He was naturalized in France, and in 1843 entered the Bureau of Statistics, where he had charge of the Department of Labor. In 1862 he resigned in order to put to use the knowledge he had gained. He received several scholastic honors, was a Fellow of the Superior Council of Statistics, and was often intrusted with missions for scientific purposes. His "Le Progrès de la Science Economique depuis Adam Smith," Professor Seligman calls "a work which in some respects compares with the best production of recent times in any country." He is best known, however, by his "Traité Theorique et Pratique de Statistique" and his various statistical writings for the French Government, and in his valuable "Annuaires de l'économie Politique et de la Statistique."

BLOOMER, AMELIA: Temperance advocate; woman suffragist; born in Homer, N. Y., 1818; married (1840) D. C. Bloomer, of Seneca Falls, where she resided till 1855. At first she worked for temperance, later for woman's suffrage. In 1849, after the first Woman's Rights Convention, she commenced the publication of *The Lily*, the first paper ever owned, edited, and controlled by a woman in the interests of women. In 1852 she advocated the use by women of that style of dress which since then has been called by her name. She herself wore it for six years. Selling her paper in 1855 she went to reside in Council Bluffs, Iowa. In 1852 she had begun to lecture; this she kept up until prevented by continued ill health. She died in 1895.

BLUE RIBBON MOVEMENTS: A distinguishing feature of many of the movements for the reformation of drinking men has been the bit of ribbon, generally blue or red, worn by the reformed men and others interested. The red ribbon was adopted by Dr. Henry A. Reynolds, 1874, as the badge of the Bangor (Me.) Reform Club. Throughout the remarkable pledge-signing campaigns that followed in Massachusetts, Connecticut, New Hampshire, Rhode Island,

Michigan, Illinois, and other states, Dr. Reynolds made the red ribbon the sign of membership in the clubs he started, and they came to be known as Red Ribbon Reform Clubs. The white ribbon was adopted by Dr. Reynolds in connection with the red, the former to be worn by women and by young men under eighteen. The blue ribbon was adopted by Francis Murphy.

The idea was borrowed in England. In 1878 a conference of temperance workers was held in London, and a total abstinence campaign was determined on. The blue ribbon was chosen, and the "Blue Ribbon Army" was adopted as the name of the organization. Pledge cards were issued and scattered throughout the British Empire, and have found their way into various countries of Europe and into Africa and the Sandwich Islands. More than 1,000,000 pledges have been officially issued in addition to the pledges issued by independent workers cooperating with the movement. A change in the name from "Blue Ribbon Army" to "Blue Ribbon Gospel Temperance Movement" has been made, and several branch organizations, such as the "Help-Myself Society" among men and the "Help-One-Another Society" among women, have grown out of the original movement.

BLUNTSCHLI, JOHANN KASPAR: Jurist; born in Switzerland, 1808; graduated at Bonn, 1829; was professor in the University of Zurich, a member of the Grand Council of the Local Government, and strongly opposed the civil war of 1847–48. In 1848 he became professor of German and international law at Munich, and in 1861 professor of political science at Heidelberg. In 1864, with Baumgarten and others, he founded the Protestant Union, and subsequently presided over several Protestant conventions, and over the General Synod at Baden in 1867. He was in favor of a union between South and North Germany, and was elected to the Customs Parliament. Bluntschli is the author of many valuable works on politics, laws, and the sciences; his best-known book in the United States being his "Theory of the State" (translated from the sixth German edition by R. Lodge).

BODELSCHWINGH, FRIEDRICH, VON: German pastor and head of Bethel, the very successful industrial colony for epileptics at Bielefeld, Westphalia, Germany; born near Tecklenburg, Westphalia, 1831; son of a Prussian cabinet minister; educated at Basel, Erlangen, and Berlin. Interested before his university studies in agriculture and mining, he became a pastor, officiating at the German community in Paris (1858–64), and later at Dellwig near Unna. In 1866, and again in 1870–71, he served as a division chaplain in the army. In 1872 he was asked to take charge of the BETHEL colony, to which he has since devoted his life, and which he has built up in many directions into a marvelous success. *Address*: Bethel, Bielefeld, Westphalia, Germany.

BÖHM, von BAWERK, EUGEN: Economist; born at Brünn, Moravia, 1851. He entered the Austrian Ministry of Finance in 1872, where he remained until 1880. In the meantime he had received the degree of LL.D. from Vienna, and had improved his two years' leave of absence in prosecuting his sociological studies at Heidelberg, Leipsic, and Jena, under Knies, Roscher, and Hildebrand. In 1880, immediately after his installation as privat-docent at Vienna, he was called to Innsbruck. In 1889 he accepted a councilor's seat in the Austrian Ministry of Finance. The best known of the important school of Austrian political economists, his main work is his "Kapital und Kapitalzins" (1884), a critical review of all theories of capital, translated into English by W. Smart (1890), under the title "Capital and Interest" (1889), giving his positive theory of capital, and also translated by Smart as "The Positive Theory of Capital" (1891).

BOILEAU (or **BOYLEAU**), **ÉTIENNE:** Born about 1200. He joined the Crusades under Louis IX. (St. Louis), was captured, and ransomed by that monarch at a high price. At one time provost of Orleans, he subsequently became (1258–1270) Provost of Paris. Boileau, a man of noble birth and incorruptible character, suppress venality, meted out justice, established the police of Paris, and hanged his godson for theft, and a friend for dishonesty. St. Louis, as a mark of confidence and approval, sometimes sat beside him at the Châtelet, where he administered justice. The great work of Boileau was his compilation, about 1268, of the "Livres des Métiers," a code of the regulations affecting the various industries of Paris. The exordium states the intention of the compiler to treat of (1) the trades of Paris, their ordinances and the breaches thereof, with the appropriate fines; (2) fees, tolls, taxes, and dues; (3) justice and jurisdictions in Paris and the neighborhood. The third part either was not written or has been lost. The registries so formed constitute a highly valuable record of the condition of industrial society at the time—its trade privileges, masters, apprentices, their number, conduct, terms of service, holidays, quality of work and of goods, prices, middlemen, fines, dues, etc. This compilation has been regarded as a landmark in the history of economics.

BOISSEL, FRANÇOIS: Born at Joyeux, Vivarais, 1728. Educated by the Jesuits, he became in 1753 parliamentary attorney in Paris, but soon removed to St. Domingo. A contest with the government over his profession brought him back to Paris and kept him there twenty years. On the breaking out of the Revolution he took an extreme Jacobin position. He is best known for his "Catéchisme du genre Humaine" (1789), in which appear many of the germs of later French socialistic thought. His first writing was "Discours contre les Servitudes Publiques" (1786). He died in 1807.

BOOT AND SHOE WORKERS' UNION, THE: Organized under this name in 1889, and affiliated with the American Federation of Labor. The first great organization of the boot- and shoe-workers was the KNIGHTS OF ST. CRISPIN, formed 1867. The Lasters' Protective Union, formed 1879, did not join the Boot and Shoe Workers' Union until 1895. The shoe-workers were among the first to join the KNIGHTS OF LABOR, and in the flourishing period of that order (1886) about half its members in New England were shoemakers. The Boot and Shoe Workers' Union had at its start a strenuous conflict between the advocates of high and low duties, won by the latter, which made the union stronger numerically than finan-

cially. Its dues were only ten cents a week, with no benefits. In 1899, however, the union was reorganized on a high-due basis (twenty-five cents a week), and one third of all its moneys was to go to a sick and death benefit fund. In 1895 a union label was adopted which has had considerable success. (See UNION LABELS.) Its organ is *The Union Boot and Shoe Worker*, published monthly. Reported membership (1905), 32,000.

BOOTH, BALLINGTON: With his wife founder and head of the Volunteers of America; born Brighouse, Yorkshire, England. Son of GEN. BOOTH, Commander of Salvation Army in Australia (1885–87), and with his wife in the United States (1887–96). In that year he separated from the Salvation Army on the ground that that organization was too autocratic and not sufficiently American, and with his wife, founded THE VOLUNTEERS OF AMERICA, which has developed into a very large and national movement. *Address*: 30 Cooper Square, New York.

BOOTH, MRS. MAUD BALLINGTON: Wife of Ballington Booth, and with him founder and head of the Volunteers of America; born Limpsfield Surrey, England. Entering the Salvation Army at the age of 17, she did a large work in Paris, Switzerland, Great Britain and Sweden. In 1886 she married Ballington Booth and became with him head of the Salvation Army in the U. S. (1887) till they (1896) left that organization and founded The Volunteers of America. In 1895 she began a work among prisoners which has developed The Volunteer Prison League with work in 25 prisons and embracing upward of 50,000 men, with homes for released convicts and a large ground work. Author among other books of *After Prison —What?* *Address*: 38 Cooper Square, New York.

BOOTH, CHARLES: Sociologist; born in Liverpool, England, 1840; educated at the Royal Institute School in his native city; has been partner in the firm of Alfred Booth & Co., since 1862, and is chairman of the Booth Steamship Company. The great work of Mr. Booth's life, however, has been the careful and scientific investigation into the conditions of the life and labor among the people of London, which he personally directed during a period of more than twelve years. The results of this investigation he has published in eighteen volumes, a mine of inestimable wealth to all who would know London and its peoples. Author: "Pauperism: A Picture"; "The Endowment of Old Age"; "The Condition of the Aged Poor"; "Old Age Pensions"; "Life and Labor of the People in London." *Address*: 24 Great Cumberland Place, W. London, England.

BOOTH, WILLIAM: Founder of the Salvation Army; born in Nottingham, England, 1829; became a minister of the Methodist New Connection in 1850. He resigned his connection with the Methodist Conference in 1861, and after living for some time in the East End of London, started, in 1865, the "Christian Mission," which was the foundation of his present organization. The movement, which was even then of a semimilitary character, did not make much impression until 1878, when he named it the SALVATION ARMY. Since that time it has grown uninterruptedly and phenomenally in all quarters of the globe. His skill as an organizer is shown by the strict military discipline which he is able to maintain throughout the whole of the organization. In 1890 he published a book called "Darkest England," which contained a scheme by which he proposed to grapple with the destitution that is eating the life out of England. This has led to the important Salvation Army Social Scheme. (See SALVATION ARMY.) *Address*: 101 Queen Victoria Street, E. C., London, England.

BOSTON: The establishment of Boston as a city, in the third decade of the last century, was a part of the process of social reorganization which was necessary after the Revolutionary War. The first citizens, with the sole exception of John Hancock, had turned Tory and left the town to its fate. After the war the yeoman farmers from the surrounding country moved in and restored the industrial and social institutions of the town. The second mayor, Josiah Quincy, adapted to the city form of administration the old communal functions of the town meetings, and devoted himself unremittingly to clearing away the rather serious sanitary and moral evils which had grown with the new growth of the town.

Boston was fortunate in having from the beginning among its citizens a keen sense of local social responsibility. This led early in the history of the city to the first steps toward that comprehensive and coordinated system of charity which has ever since been characteristic of the city. Joseph Tuckerman and Dorothea Dix are two of the foremost names associated with the development of charitable endeavor in the first half of the last century. The social unrest that was prevalent in Europe in the second quarter of the last century found expression in some rather broad forms of organization among workmen which were encouraged by men like William Ellery Channing and William Lloyd Garrison. On the more romantic side its influence was seen in the establishment of BROOK FARM. The spirit of social reform in Boston, after the success of the movement led by Wilberforce in England, led to the development of the determination to wipe out the national blot of negro slavery. For some thirty years, until after the Civil War, this cause much overshadowed all other philanthropic tendencies. But so far as the life of the city in general was concerned, this period was notable as the golden age of its civilization, during which it numbered among its citizens one of the most remarkable groups of statesmen, orators, literary men, eminent divines, and public-spirited business men that have ever appeared together in any city.

A very important expression of the social spirit in Boston has come about through a series of radical sanitary reforms; the first of which took place after the epidemic of cholera in the "fifties," the others having succeeded several later outbreaks of contagious or infectious diseases. This development reached its climax in the law which gives the Board of Health power not only to condemn but to destroy unsanitary tenements; a power which has been largely used. A correlative law of equal importance is that which has practically abolished the sweating system through requiring good sanitary conditions in and about all houses in which licenses for home work are granted.

Sanitary Reforms

The growth of philanthropic effort in Boston during the past generation has been affected very largely by the great immigration, first chiefly of Irish, and later chiefly of Jews. The effort to meet the new conditions caused by this incoming tide of population has taken several forms. Thirty years ago most of the relief-giving agencies of the city were effectively organized into the Associated Charities, which has ever since been the foremost agency in securing comprehensive discriminating care of families in distress. Mrs. Mary Hemenway instituted the system of cooking schools which were later taken up by the public-school authorities. She also purchased the historic Old South Meeting House, and provided for its use as a patriotic educational center. Mrs. Quincy Shaw instituted the experimental kindergartens, which, in turn, were later made part of the public-school curriculum. Robert Treat Paine founded the two great workingmen's resorts, the Wells' Memorial and the People's Institute. Since 1890 a large number of settlement houses and other similar centers for neighborhood improvement have sprung into existence. There is at present a noticeable tendency toward federation and joint action between these different local centers, so as to secure the maximum economy of force in the detailed work of the neighborhood betterment, and to bring to bear their whole united force upon some of the larger sanitary and moral problems affecting all the more crowded districts of the city.

Municipalism

The tendency toward progressive municipal action in Boston, which was started by the first Josiah Quincy, was strengthened by the second Josiah Quincy, who established the Public Library and the Municipal Water Supply. This was continued, too, in some striking ways by the third Josiah Quincy, who greatly developed the system of public baths, instituted municipal gymnasiums, created a municipal printing plant, and endeavored unsuccessfully to have the city do all its own general repairs. The difficulty about the Municipal Repair Department was that most of the employees were unfortunately appointed through political influence, and their lack of individual skill went with a general lack of effective discipline. The Municipal Printing Plant still continues. It is much criticized; tho after its first year a group of master printers certified that its business had been conducted satisfactorily. The most important step in the direction of municipal ownership which Boston has ever taken is that of completing the subway, first under Tremont Street, then under Washington Street. When the second part of the subway was proposed, the risk having been eliminated, the company made an extremely aggressive attempt to secure for itself from the legislature the privilege of completing and owning it. This effort was frustrated largely through the activity of a body of business men called the Public Franchise League. This league has been successful also in keeping the capitalization of the gas combination down to a proper figure. A new but very promising movement in Boston is that of the Massachusetts Civic League, which is a federation of agencies for local social betterment in city, town, and village throughout the state for the promotion of progressive social legislation.

The building up of the park system of metropolitan Boston has grown into a vast enterprise, and is just now (1907) nearing completion. This system includes two large marine parks, at Revere on the north and at Nantasket on the south. A series of parkway boulevards runs completely around the city and principal suburbs, ending in and connecting these two marine parks, and including in their course the great Blue Hill Reservation on the south, and the Middlesex Falls on the north. A series of small parks along the Charles River will end in a basin which is being created by the erection of a dam near the outlet of the river. Almost all the districts of the city are now provided with ample local playgrounds.

Labor

While certain phases of the organization of labor have, as has already been mentioned, been a part of the social movement in Boston for nearly a century, for all effective purposes such organization dates here, as for the country at large, since the Civil War. The leading spirit in such effort from that time until the present year has been George E. McNeill, who is particularly known as the champion of the eight-hour day. The Knights of Labor lost their influence in Boston nearly twenty years ago. Since that time trade-unionism proper has had a slow, steady, and, in the aggregate, comprehensive growth. Boston has probably had as few great strikes as any city in the country, but it may be doubted whether organized labor is stronger in any other city. On the whole its policy has been that of moderate diplomacy, always heading toward the large end in view by securing ample representation in all the various industrial occupations, and step by step gaining the proper wage and hour conditions for the individual members. This attitude on the part of organized labor has been to a considerable degree the indirect result of the salutary point of view which has been held by many employers and by the general public. While there have been occasional adverse decisions by the courts, on the whole there has been little of that unyielding attitude of the judiciary as to labor questions which has precipitated so much difficulty in some other parts of the country. For many years organized labor has been effective also in securing amelioration of labor conditions through state legislation. In general, the uninterrupted success which organized labor has had in all directions of its activity has removed the inducement to violent or even unduly aggressive expressions.

Partly for these same reasons socialism in any of its forms has never gained substantial footing in Boston. It has been represented from time to time by socialistic propaganda of a more or less abstract or sentimental type. At times movements of this sort have had important educational results; but at present socialism as an avowed cause seems to depend upon the more recent immigrants, and distinctly ebbs and flows with the downfall and rise of the labor market. Besides the discussions of social problems which take place in trade-union and other working-class gatherings, all such questions find a free platform in the Twentieth Century Club, which has now existed for fifteen years, and which has a membership of 600 men and women representing a great variety of interests, all of which, however, have some relation toward the bringing in of a "better public spirit, and a higher social order." The City Club just now being formed will provide a non-partizan meeting-place for men of all classes and nationalities who are interested in promoting the city's public welfare.

Boston has not shown distinct activity in developing systematic educational opportunities for the study of social questions, tho many educational institutions in the vicinity have within recent years greatly strengthened the course which they offer in such subjects. The School for Social Workers, founded by Harvard and Simmons Colleges, is now in its third year, and gives promise of being successful and useful. A significant fact in connection with the life of Boston as a center for social advance is that it is the seat of the state government, the only case in the United States where a large city is also the state capital. To this fact is partly due the progressive social legislation of Massachusetts, which is being added to in greater and greater degree as years go by. This advantage, however, is balanced by the fact that Boston, unlike all other large urban centers in the United States, has not extended its political boundaries so as to include among its electorate the enlightened and responsible suburban population. The fact that the city government has recently fallen into the complete control of those who contrive to gain political power in the downtown congested districts, places the municipality in a position where for the present not much further sound progressive action can be expected. The project of a metropolitan government for Boston and its suburbs is being urged from time to time, but strong local traditions and interests in most of the suburbs make it hardly possible to secure fair consideration for a scheme of administration which the facts of the situation so urgently demand.

Socialism

The following are some of the most important socialistic and charitable organizations in Boston:

Associated Charities. 43 Hawkins Street.
Central Labor Union. Office, 987 Washington Street.
City Club. 9 Beacon Street.
Denison House. 93 Tyler Street.
Massachusetts Civic League. 3 Joy Street.
People's Institute. 1171 Tremont Street.
School for Social Workers. 9 Hamilton Place.
Socialist Labor Party. 699 Washington Street.
South End House. 20 Union Park.
Twentieth Century Club. 3 Joy Street.
Wells' Memorial Institute. 987 Washington Street.
Women's Industrial and Educational Union. 264 Boylston Street.
Young Men's Christian Association. 458 Boylston Street.

ROBERT A. WOODS.

BOUCICAUT, JACQUES ARISTIDE: French philanthropist; born in Bellême, Orne, 1810; son of a hatter. Coming to Paris, first as an employee, in 1852, he became proprietor of a small shop which he gradually developed into what is now the great "Au Bon Marché." He built up his trade by thorough organization and by selling at fixt prices and very small profit. He gained the good-will too of his employees, by improving their condition, suppressing fines, inaugurating Sunday and holiday closing, gradual promotion, giving them an interest in their sales, and taking charge of their savings at better interest than could be gotten elsewhere. In 1876 he founded for them a Provident Fund, to enable them to put by for old age. Each employee who has been five years with the house is given a small share of the profits in proportion to his salary, and also 4 per cent each year on his savings. By 1903 there were 2,796 participators, with a capital of 3,902,598 francs, and 2,207,134 fr. had been distributed since the foundation of the fund. Mr. Boucicaut died in 1877, and his son two years later. His widow ably conducted and developed the work until her death in 1887. The company has continued the work along the same lines, and under the same name, "Au Bon Marché." In 1886 Madame Boucicaut also founded an Employees' Retiring Fund, endowed with 5,000,000 fr. All employees are entitled to a pension after twenty years' service, at the age of forty-five for women, and fifty for men. Before this age limit assistance is given to the incapacitated, and to widows and orphans. In 1892 a third Relief and Pension Fund was established, amounting (1903) to 635,220 fr. To-day the great store is known throughout the world, and employs some 3,000 persons.

BOUNTIES: In social science the term "bounty" is usually applied to a premium given by a government to promote some branch of production or industry which it desires to encourage or aid. It is, however, used also for payments of money to induce men to enlist in the army and navy. In Great Britain the giving of bounties of this latter kind has been common. In the United States it has been adopted to a less extent, but in the War of the Rebellion some recruits of the Union Army received as much as $500 or more. Some, however, enlisted, received the bounty, and soon after deserted, receiving the merited name of "bounty-jumpers."

The giving of bounties to encourage industry has been practised at times by almost all nations. England, which has now in the main rejected the bounty system, formerly gave bounties for many industries, notably to encourage the herring fisheries, the Irish linen trade, and the exportation of grain. After the founding of the Royal Academy (1769), a bounty was given on the exportation of engravings. For many years, however, under the influence of free-trade ideas, the English Government has given up the bounty system in the main, tho still granting subsidies to steamship companies. (See SUBSIDIES.) France, Germany, and all the greater continental powers have held on to the bounty system much longer, especially as regards bounties upon sugar. In the United States bounties have been given for tree-planting and sugar, with subsidies and land grants to railways and steamship companies. (See SUBSIDIES.) In 1890, for example, Congress voted a bounty of two cents per pound for fifteen years on the production of domestic sugar. This was, however, ended by the tariff of 1894, altho an appropriation of $5,238,289 was later voted to continue the operation of the bounty on sugar raised before June 30, 1895.

Almost all political economists have condemned bounties in general, altho many have approved of them under particular circumstances. Adam Smith vigorously and Ricardo still more sweepingly condemned bounties, on the ground mainly that they diverted capital perniciously; and their position has been generally followed by free-traders and been criticized by protectionists. Bounties, however, have sometimes been preferred to a protective tariff by free-traders, on the ground that their working is open and direct, not covert, like a tariff. They have been denounced, on the other hand, by some protectionists, as more artificial than a tariff. A tariff, it is argued, makes the foreign exporter pay; a bounty taxes the general citizen for the good of one class. (See FREE TRADE; PROTECTION; SUBSIDIES.)

BOURNEVILLE: A model industrial village, established about five miles from Birmingham, England, by Mr. George Cadbury, the noted cocoa manufacturer, philanthropist, and Friend. Bourneville was founded in 1879, when the works of Cadbury Brothers were moved to that site; but at that time they employed only about 300 hands, and practically most of the village was created in 1895. In 1900 Mr. Cadbury turned over 485 acres of land to the "Bourneville Village-Trust," as an absolute gift, the total value (including the village) being about £200,000, to be administered for the provision of improved dwellings with gardens and open spaces for the amelioration of the condition of the workers. Factories are not to occupy more than one fifteenth of the total area. There are now over 500 cottages with a population of about 2,500. Only about one half the population work in the Cadbury mills. At first land and cottages were sold, but after 150 cottages had been sold, it was decided only to lease, in order to be sure that all should be administered in the spirit of the foundation. The rents range from six shillings and sixpence a week to thirteen shillings, including a local rate of six shillings and fourpence in the pound. Ground rent is calculated at £20 an acre, with about eight houses to the acre. Rents are calculated to return about 4 per cent on the capital. The cottages are semidetached, or in blocks of four, and there is great variety of design with a general similarity of style. Most of the later buildings have one large or two small sitting-rooms, three or four bedrooms, and a kitchen with a bath sunk in the floor, larder, closets, and sometimes an attic. The fireplaces are attractive, with tiled hearths and artistic chimney-pieces.

Gas, water, and sewage are supplied by the city of Birmingham. The roads are forty-two feet wide, with trees. Dwellings may occupy only one fourth of a lot, and one tenth of the land (exclusive of roads) must be used for parks and open spaces. Grass-plots, flower-beds, and shrubs, with low hedges or fences, add to the attractiveness.

The more attractive public buildings are: Ruskin Hall, with lecture-hall, picture-gallery, and library; a bath-house; a boarding-house; a schoolhouse for 540 children; a kindergarten; and a Friends' meeting-house. Adjoining the factory are a twelve-acre recreation ground for girls, with gymnasium, swimming-bath, tennis-court, and cricket and hockey grounds, and a fourteen-acre lot similarly equipped for boys. Various clubs, lecture courses, flower shows, etc., develop the educational, recreative, and artistic life of the village. A cooperative "Bourneville Tenants' Company, Limited" enables workmen to build their own homes.

BOWERMAN, C. W.: English labor member of Parliament; born 1851; learned the printer's trade in London. He has been a member of the London Society of Compositors since 1873; was appointed its news secretary in 1889, and elected general secretary in 1892. He was a delegate to every trade-union congress except that held at Norwich, and in 1897 was elected to the parliamentary committee of the trade-unions, presiding over the annual congress held at Swansea in 1901. He has been on the London County Council for some years, and was elected alderman in 1901. Within the past year he has been appointed parliamentary secretary to his society. He was elected to Parliament in 1906 for Deptford. Endorsed by the Labor Representation Committee. *Address*: 4 Battledean Road, Highbury, N. London, England.

BOYCOTTING: A boycott is a combination against a landlord, tradesman, employer, or other person, whereby the persons enforcing the boycott cease social or business relations with the party boycotted, and seek to induce others to withhold having relations with him. It is used also of agreements not to use certain articles or the articles of a certain manufacturer, on the ground that they have been produced in ways or under conditions condemned by the parties dictating the boycott. The word is derived from the name of Captain Boycott who in 1880 was living at County Mayo, Ireland, as land agent to Lord Erne, an Irish nobleman. The population of the region for miles around resolved to have nothing to do with him, and as far as possible to prevent any one else from having anything to do with him. His life appeared to be in danger—he had to claim police protection—and to prevent civil war the authorities had to send a force of soldiers, and Captain Boycott's harvests were always brought in guarded by a little army. Boycotts, tho largely conducted by trade-unions, are by no means confined to them. Manufacturers boycott certain dealers; railroads boycott railroads; temperance people boycott certain persons; clergymen establish boycotts; almost everybody boycotts somebody at certain times. There is record of a boycott in England as early as 1221. Boycotting, if properly conducted by parties for their own advantage, are now generally believed to be legal, tho five states—Alabama, Colorado, Illinois, Indiana, and Texas—have statutes applying expressly to boycotting. Acts usually committed by persons engaged in boycotting are prohibited in other states. Says Dr. Carroll D. Wright: "If A considers a dealer, B, as dishonest, he has a perfect right to say to his friends, 'I do not trade any more with B, and I advise you not to for such a reason.' That is a boycott; we all indulge in it; it is legitimate. But when A says to his friends, 'If you trade any more with B, we trade no more with you, and if that does not succeed, we destroy your business,' that is a crime: that is not a lawful method of prosecuting one's claims." The common law seems to be that workmen associated together in a union may combine to cease dealing with an employer who refuses to comply with the union's rules, since they constitute the party aggrieved and are directly to be benefited by inducing him to yield. Injunctions, however, have been granted against boycotts and "in no case decided by the higher American courts has a boycott by workmen been specifically held legal" ("U. S. Industrial Commission Report," xvii., p. cxix).

BOYS' CLUBS: See Clubs.

BRABAZON, REGINALD: Twelfth earl of Meath; Baron Chaworth; Baron of Ardee, Ireland; born in London, 1841. He was educated at Eton College and in Germany; and after passing the Civil Service examination he entered the Foreign Office in a clerical capacity (1863). In

1868 he exchanged into the diplomatic service, and passed several years at Frankfort-on-the-Main, Berlin, The Hague, and Paris. He is interested in the industrial conditions of the people, and has been connected with many of the agencies and societies at work for the betterment of those conditions. He was the first honorary secretary of the Hospital Saturday Fund (1874), and first chairman of the Young Men's Friendly Society (1879). In 1882 he founded the Metropolitan Public Garden Association, and was its first and is its present chairman (1907). He was the first president of the British College of Physical Education, and has been at different times an alderman of the London County Council. In his philanthropic activities he is prominently identified also with the Dublin Philanthropic Reform Association (first president), and with the Christian Union for Social Service (president). He is the author of "Social Arrows" and "Social Aims"; and the editor of "Some National and Board School Reforms," "Prosperity or Pauperism," etc. *Address*: 83 Lancaster Gate, W., London, England.

BRACE, CHARLES LORING: One of the founders of the Children's Aid Society; born at Litchfield, Conn., 1826; graduated from Yale in 1846; studied theology at the Yale Divinity School, 1847–48, and at Union Theological Seminary 1848–49. In 1850 he visited Switzerland, England, and Ireland, giving especial attention to schools, prisons, and reformatory institutions, and returned to the United States in 1852. Here he entered into active missionary labors in New York City, and was one of the founders of the Children's Aid Society, remaining its secretary and principal agent from a year after its foundation until his death. In 1854 he established the first newsboys' lodging-house in the city; in 1855 an Italian industrial school; and in 1856 a German industrial school. He devoted the remainder of his life to work among the children and youth of the poor of New York City. He died in the Tyrol, Switzerland, 1890. Among his works may be mentioned: "Hungary in 1851"; "Home Life in Germany"; "Short Sermons to Newsboys"; "The New West"; "The Dangerous Classes of New York, and Twenty Years' Work among Them"; "Free Trade as Promoting Peace and Good Will among Men"; "Gesta Christi, or, A History of Humane Progress under Christianity"; and "To the Unknown God."

BRADLAUGH, CHARLES: English agitator and writer; born 1833; son of a solicitor's clerk in the East End of London. When being prepared for confirmation at the church which he attended, he expressed doubts concerning some of the doctrines taught; and on receiving a severe rebuke for daring to doubt, he turned to the street lecturers, finally becoming a speaker himself. On account of his ideas he was compelled to leave his father's house, and endeavored to gain a living as coal agent. Not succeeding he enlisted in the Dragoon Guards (1850), serving for some time in Ireland. In 1853 he returned to London and became a clerk in a solicitor's office. From that time he was known as an antitheological lecturer, and wrote under the pseudonym of "Iconoclast." He also took an active and often a leading part in the radical movements of the time.

In 1860 Bradlaugh started his paper, *The National Reformer*, which in 1868 was prosecuted by the government. The prosecution was abortive, and led to a repeal of the law under which the proceedings had been taken. In 1872 he published "The Impeachment of the House of Brunswick," which is, perhaps, his best-known literary work. In 1873 he undertook two lecturing tours in the United States. In 1875 he, with Mrs. Annie Besant, was tried for having republished an old pamphlet, "The Fruits of Philosophy." The result of the trial was that the defendants, tho "exonerated from all corrupt motive," were sentenced to six months' imprisonment, and to pay a fine of £200. On appeal, the sentence was reversed. In 1868 and twice in 1874 he was an unsuccessful candidate for parliamentary honors; in 1880, however, he was elected as junior member for the borough of Northampton. Now commenced the struggle with the House of Commons, by which his name will be best known. Refusing to take the oath of allegiance, and desiring to affirm, his seat was declared vacant. Re-elected in 1881, he was expelled by force. Again elected in 1882, but still debarred from sitting, he resigned, in order to again appeal to his constituency in 1884; and tho again elected, it was not till after the general election of 1885 that he was allowed to take his seat. In 1887 he was instrumental in getting appointed the Royal Commission on Market Rights and Tolls, and carried through Parliament an act amending and extending the truck laws. In 1888 he brought in an "Affirmation Bill," which was carried. In 1889 he was requested by the Indian National Congress to represent their national interests in the English Parliament. A consistent individualist, he combated at every step the growing tide of socialism. He died in 1891.

BRASSEY, THOMAS, BARON: English economist and writer on naval affairs; born in England, 1836; son of a railroad contractor. He was called to the bar in 1864, but never practised. In 1865 he was elected member of Parliament for Devonport, and remained in Parliament for a number of years. Naval matters engaged his chief attention, and he assisted in forming the naval artillery volunteers. He and his wife, in their yacht *Sunbeam*, have made many long voyages to all parts of the globe. In addition to numerous shorter writings on naval affairs and social questions, he has published "Work and Wages"; "British Seamen"; and "Lectures on the Labor Question." Lord Thomas has rendered assistance on various charitable commissions. *Address*: 24, Park Lane, W., London, England.

BRAY, CHARLES: Social reformer; born at Coventry, England, 1811. He became a manufacturer of ribbon, but was early interested in matters of reform on the lines of Robert Owen and Thomas Carlyle. He saw the opening of Harmony Hall in Queenwood Community (see Owen), but the failure of that experiment convinced him that such attempts were premature. He wrote "The Philosophy of Necessity" (1841), with an appendix by his sister-in-law, Mary Hennell, later published separately as "An Outline of the Various Social Systems and Communities which have been Founded on the Principles of Cooperation." He was also the author of several essays and addresses, notably "An Essay upon the Union of Agriculture and Manufactures, and upon the Organization of Industry," and of an autobiography. He died in 1884.

SAMUEL GOMPERS, U.S.A.
Trade Unionism

BRAY, J. F.: An English communist of the school of Owen of whom little is known save his book, written in 1839, "Labour's Wrongs and Labour's Remedy; or, The Age of Might and the Age of Right." This work, to-day almost forgotten, was one of the ablest of its day, and was noticed at some length in Marx's "Philosophy of Misery" (1847) and other writings of the times. Palgrave's "Dictionary of Political Economy" says of it: "The book tries to prove that all those who perform equality of labor ought likewise to receive equality of reward." Imprest by the modern growth of joint-stock companies, Bray proposed a "joint-stock modification of society, admitting of individual property in productions in connection with a common property in productive powers." He also suggested a paper and pottery currency, whose foundation is labor.

BRENTANO, LUJO: Professor of national economy at the University of Munich; born at Aschaffenburg, Germany, 1844. He was one of the founders of the Association for Social Politics, or Socialists of the Chair, as they are called in Germany, altho belonging to the extreme right of this school. Outside of Germany he is best known by his "History of English Guilds," and his larger work on "English Trade-Unions," neither of which, however, is considered very complete or satisfactory. *Address*: Friedrichsstrasse 11, Munich, Germany.

BRETHREN OF SOCIAL LIFE: A fraternity founded by Groote and Radewin in 1376; sometimes called Brethren of the Common Lot, Brethren of the Common Life, or Brethren of Good Will. It profest to imitate the earliest Christian communities, and eventually merged into the sect of Moravians. It was composed of pious persons who sought to elevate their souls by spiritual exercises; and it was sanctioned by several popes and councils. Community of goods, industry, frugality, education of the young, and the use of the vernacular language in religious worship were some of their peculiar usages. They bound themselves by no monastic vow. In 1430 they had 130 societies, chiefly in Germany and the Netherlands. The original founders were opposed to all learning and science that was not moral and practical; but the brethren rendered valuable service to the cause of popular and free education, and have been called the pioneers of the Reformation. Thomas à Kempis belonged to one of these societies. Similar female societies were organized, each under a superior or *Martha*.

The Order of the Brethren of the Common Lot was divided into two classes, the lettered brethren, or clerks, and the illiterate; they lived in separate habitations, but maintained the closest fraternal union. The former devoted themselves to preaching, visiting the sick, circulating books and tracts, etc., and the education of youth, while the latter were employed in manual labor and the mechanical arts. They lived under the rule of St. Augustine, and were eminently useful in promoting the cause of religion and education.

The theory of this community was that unity should be sought rather in the inward spirit than in outward statutes. Vows were not binding for life. Property was surrendered, not on compulsion, but voluntarily. All the brother houses were kept in communication with each other, and the heads of houses met annually for consultation. Particulars of their rule, domestic arrangements, etc., may be found in Ullmann's "Reformers before the Reformation," ii., 89 *sq*. Luther and Melanchthon spoke with approval and sympathy of the brotherhood in their time. Its flourishing period extended from 1400 to 1500. Most of their houses were built between 1425 and 1451, and they had, in all, some thirty to fifty establishments. During the sixteenth century the Reformation broke them down, in common with other monkish establishments; or, rather, they crumbled to pieces as needless amid the new developments of the age. By the middle of the seventeenth century the brotherhood was ended.

BREWERY WORKERS. See United Brewery Workers.

BRIAND, M. ARISTIDE: French independent Socialist, appointed Oct. 23, 1906, in the cabinet of M. Clemenceau, as Minister of Public Instruction. He has had charge of the important agitation for the separation of Church and State in France.

BRICKLAYERS AND MASONS' INTERNATIONAL UNION OF AMERICA: Organized 1865; one of the largest American trade-unions, not affiliated with the American Federation of Labor. The organization is almost purely protective. Early in its history strikes were numerous, but latterly the union has been among the most successful in developing agreements with employers. In 1886, partly through the efforts of Mr. W. H. Sayward, Secretary of the Mason Builders' Association, a system of joint agreements as to collective bargaining and arbitration was developed, and the system was spread. In 1906 the union reported 90,000 members. Its organ is *The Bricklayer and Mason*.

Reference: *Report of the United States Industrial Commission*, vol. xvii. (1901), pp. 118, 374–75.

BRIGHT, JOHN: English statesman, born at Greenbank, Lancashire, 1811; son of Jacob Bright, a Quaker cotton-spinner. In his sixteenth year he entered his father's factory, but early became interested in temperance, parliamentary reform, and other questions of the day. The reform struggle of 1832 moved him deeply. In 1839, when the Anti-Corn Law League was formed, he and Cobden were the leading members of it, and commenced a free-trade agitation throughout the kingdom. Bright became M. P. for Durham in 1843. His eloquent and energetic advocacy of free trade produced at last the repeal of the corn laws. He was associated with Cobden in a movement for financial reform, and later with a movement to reform the system of electoral representation. He came to be with Cobden the head of the so-called "Manchester School," and vigorously opposed the ten-hour movement and almost all industrial legislation. Being a member of the Peace Society, as well as of the Society of Friends, he strenuously opposed the war with Russia in 1854. Some of the severest denunciations of war ever uttered are to be found in his speeches. In 1857 he was elected from Birmingham, and long represented that city. He strongly condemned the then existing game laws of Great Britain. In 1868 he accepted the presidency of the Board of Trade in Gladstone's administration, and worked for the disestablishment of the Irish Church and the Irish Land Act, aiming at peasant proprietorship. In 1870 he resigned from office on account of ill health, but took office again in 1873–74, and 1882 as chancellor of the Duchy of Lancaster. In 1886 he op-

posed the Home Rule bill introduced by Mr. Gladstone. In 1883 he became lord rector of the University of Glasgow. He died in his boyhood's home, March 27, 1889.

BRINKERHOFF, ROELIFF: Philanthropist; born at Owasco, N. Y., 1828; educated in the common schools and at Auburn and Homer academies; taught school for two years, and at the age of eighteen served as tutor in the home of General Jackson. He studied law with Judge Brinkerhoff at Mansfield, Ohio, and in 1852 began the practise of law. From 1855 to 1859 he was editor and proprietor of *The Mansfield Herald*. At the outbreak of the Civil War he entered the army, attained the rank of colonel, and for meritorious service was made brevet brigadier-general. After the war he resumed the practise of law until 1873, when he became cashier of the Mansfield Savings Bank, of which he is now president. Since 1878 he has been a member of the Ohio State Board of Charities, and is now its chairman. He was president of the national Conference of Charities and Corrections in 1880, and vice-president of the International Prison Congress at Paris in 1885. Officiating for many years as vice-president of the American National Prison Congress, he was made its president at the death of General R. B. Hayes. He is the author of "The Volunteer Quartermaster"; and "Recollections of a Lifetime." *Address*: Mansfield, Ohio.

BRISBANE, ALBERT: American Fourierite and social reformer; born in Batavia, N. Y., 1809, of wealthy parents of Scotch-English stock. He was liberally educated, and traveled extensively in Europe and in Asiatic Turkey. Becoming deeply imprest with the inhumanity and injustice of the present social system, he studied in Paris the views and philosophy of FOURIER, and then presented them to American readers in two books: "Social Destiny of Man" (1840), and "A Concise Exposition of the Doctrine of Association." These had an immediate effect on the members of BROOK FARM, and contributed largely to turn that colony into a Fourierite phalanx. Horace Greeley, William Henry Channing, Charles A. Dana, and others were also deeply influenced by him. Greeley opened the columns of the *Tribune* to Brisbane by allowing him to purchase for two years (1842–44) a column of the paper in which to advocate Fourierism. Later Brisbane published two volumes of "Sociological Series" (1876). He also invented several mechanical devices of importance. He died in Richmond, Va., 1890.

BRISBANE, ARTHUR: American editor; born at Buffalo, N. Y., 1863; son of Albert BRISBANE; educated in public schools and in France and Germany. He entered the field of journalism as a reporter on the *Sun*, and later became editor of the *Evening Sun*. From 1890 to 1897 he was on the editorial staff of the New York *World*, and since 1897 has been editor of the New York *Evening Journal*. Mr. Brisbane follows in the main his father's socialist views, but believes they should be worked out in opportunist and political methods. *Address*: Hempstead, Long Island, N. Y.

BRISSOT, JEAN PIERRE (surnamed **De WARVILLE**): French sociologist and revolutionist; born at Chartres, France, 1754. Educated for the law, he entered the office of a procurator at Paris, but early devoted himself to political science. His "Théorie des Lois Criminelles" and "Bibliothèque Philosophique de Législateur" brought him notoriety and the favor of Voltaire, D'Alembert, and others. These works were imbued with the philosophy of Rousseau, and contain the saying, afterward made famous by Proudhon, "La propriété, c'est le vol." A facile writer, he wrote for papers unworthy of him, but later went to London and started *Le Journal du Lycée de Londres* to unite all the savants of Europe. Returning to Paris, he was lodged in the Bastile on an unfounded charge. Released after a few months, he recommenced pamphleteering, and, having met some abolitionists in London, he organized in Paris a Société des Amis des Noirs. He visited the United States, but returned to play a leading part in the French Revolution. He edited the *Patriote Française* and in the National Assembly leagued himself with the Girondists, then often called the Brissotins. He bravely suffered death on the guillotine with the Girondists, Oct. 30, 1793.

BRITISH ECONOMIC ASSOCIATION, THE: Founded at a meeting held at University College, London, on Nov. 20, 1890, the Rt. Hon. G. J. Goschen, M. P., being in the chair. The object of the association is the advancement of economic knowledge by the issue of a journal and other printed publications, and by such other means as the association may from time to time agree to adopt. The journal represents all shades of economic opinion, and is the organ not of one school of economists, but of all schools. The annual subscription is one guinea. There is at present no entrance fee. Any member may at any time compound for his future yearly payments by paying at once the sum of ten guineas. The current numbers of the journal, issued in March, June, September, and December, and published by Messrs. Macmillan & Co., are sent to members free of charge. The price is 5 shillings each copy, or 1 guinea (net) for the annual volume bound.

BRITISH EMPIRE, THE: The growth of the British Empire is in many ways the greatest social reform fact in the world. According to Hazell's "Annual":

The area of the British Empire was estimated at 8,329,000 sq. m. in 1837, and in 1861 it was about the same figure. Of the total, 9,115,000 sq. m. are under settled government, the self-governing colonies alone covering about 7,000,000 sq. m.

In 1837 the population of the British Empire was 168,000,000; in 1861 it was estimated at 175,000,000; in 1871 at 235,000,000; in 1881 over 254,000,000; in 1891 nearly 372,000,000; and in 1901 it had reached over 400,000,000.

In 1837 there were about 25,750,000 British in the United Kingdom and about 1,500,000 in the colonies, making a total of 27,250,000. In 1905 there were 43,220,000 British in Great Britain and 10,780,000 in the colonies, giving a total of 54,000,000.

The total revenues of the empire amounted to about £75,000,000 in 1837, the United Kingdom having a revenue of £50,000,000, and India and the colonies about £25,000,000. In 1903 the revenues of the empire amounted to £317,000,000.

Sir Robert Giffen, at the meeting of the British Association in Sept., 1903, put forward the following estimates as to the aggregate income and wealth of the people of the British Empire:

	Aggregate Income	Capital or Wealth
United Kingdom.....	£1,750,000,000	£15,000,000,000
Canada.....	270,000,000	1,350,000,000
Australasia.....	210,000,000	1,100,000,000
India.....	600,000,000	3,000,000,000
South Africa.....	100,000,000	600,000,000
Remainder of empire...	200,000,000	1,200,000,000
Totals.....	£3,130,000,000	£22,250,000,000

[2] £132,887,000 in England; £81,529,000 in India.

BRITISH AND FOREIGN ANTI-SLAVERY SOCIETY: Founded 1839, its first president being Thomas Clarkson. The objects of the society are: "The universal extinction of slavery and the slave-trade; and the protection of the rights and interests of the enfranchised population in the British possessions, and of all persons captured as slaves." The society publishes a journal, *The Anti-Slavery Reporter*. Secretary, Travers Buxton, 51, Denison House, Vauxhall Bridge Road, S. W., London, England.

BROADHURST, HENRY: English trade-unionist; M. P.; born near Littlemore, Oxfordshire, 1840; the son of a journeyman mason. He worked at his father's trade till 1872, when he was elected to the Parliamentary Committee of the Trade-Union Congress, becoming a most indefatigable worker, and serving as secretary of the committee from 1875–90. In 1880 he was returned to Parliament from Stoke-upon-Trent. In 1885 he was elected from the Boardsley division of Birmingham; in 1886 from Nottingham (West), and in 1894–1906 from Leicester. He was re-elected from Leicester Jan., 1906, but retired in March. He has been a member of two royal commissions, and in 1886 was appointed Under Secretary of State for Home Affairs. He is a Liberal in politics, and for a long period opposed the new trade-unionism, eight-hour legislation, etc. He has, however, changed his position on the eight-hour bill, and was in 1894 deemed one of the most progressive members of the Trade-Union Parliamentary Committee. Broadhurst is the author, together with Sir R. T. Reid, of a "Handy Book on Leasehold Enfranchisement," and has written also an autobiography. *Address*: 4, Elm Gardens, Brook Green, W. London, England.

BROCKWAY, ZEBULON REED: Prison reformer; born in Lyme, Conn., 1827. Became clerk of Connecticut State Prison, 1848; then deputy superintendent at Albany, 1851; and superintendent in Monroe County, N. Y., 1859; in Detroit, Mich., 1861; in Elmira State Reformatory, 1876–1900. It was mainly through his efforts that Elmira introduced the system of the Indeterminate Sentence, which has led to such general and successful reforms in prison systems. See *Elmira*. In 1900 he retired, but in 1905 was elected Mayor of Elmira, being nominated by both parties. *Address*: Elmira, N. Y.

BROOK FARM: A cooperative association formed in 1842 on a 200-acre farm nine miles from Boston, by a group of highly educated people. The association carried on farming and maintained an excellent boarding school, the pupils being members of the associated family. Owing to the character of the leaders and their friends, the life at Brook Farm took on many refined and charming aspects, which gave it great fascination for the general public, and which rendered the lives of the members exceedingly rich and interesting. Most of the distinguished men and women of the day were visitors at Brook Farm, and it became a center of intellectual and artistic life. All the members were stockholders and took more or less part in the manual labor of the farm. Meals were taken in common in a central hall. There were about 115 members.

The spirit of the place voiced the transcendental religious feeling current at that time, but there was no distinction made as to creed, and every one was free to worship as he chose. The members were, however, sustained in their efforts by an exalted belief in the possibility of social regeneration, and the founding of a heaven upon earth. Miss Peabody wrote in *The Dial*: "There are men and women who have dared to say to one another, 'Why not have our daily life organized on Christ's own idea? Why not begin to move the mountain of custom and convention?'" Later she further described the group of people who had resolved to make this attempt: "In order to live a religious and moral life they feel that it is necessary to come out in some degree from the world, and to form themselves into a community of property, so far as to exclude competition and the ordinary rules of trade; while they reserve sufficient private property for all purposes of independence and isolation at will. They make agriculture the basis of their life, it being the most direct and simple in relation to nature. A true life, altho it aims beyond the highest star, is redolent of the healthy earth. The perfume of clover lingers about it. The lowing of cattle is the natural bass to the melody of human voices."

Bodily and mental labor were paid at the same rate at Brook Farm, it being believed that since intellectual labor involves higher pleasures than bodily labor, it therefore is to some extent its own reward; while bodily labor involves a greater sacrifice on the part of the individual. The hours redeemed from labor by cooperative work were to be used, not in acquiring wealth, but intellectual goods. Real wealth consists, so the Brook Farmers declared, in the "leisure to live in all the faculties of the soul."

The first years of the Brook Farm experiment have been called its transcendental period, and it was then that the idealism of the movement and its spiritual vitality seemed to be at their height. A change occurred when Fourierism, then making a stir in the reform world, was introduced and accepted at Brook Farm. A new element came in with the influx of more working-class people, and the building of mechanics' workshops and a large phalanstery. The change, though honestly undertaken, proved in the end fatal. The dream period of the earthly paradise was over, and the Brook Farmers awoke to the painful discovery that they were ill-adapted to carry on practical enterprises. A disastrous fire, unprotected by insurance, compassed the final ruin of the experiment, which had lasted about six years. Its leader throughout, as well as its founder, was George Ripley, accomplished scholar and devoted idealist, who had received encouragement and assistance from men like Dr. Channing, Rev. Theodore Parker, Dr. J. C. Warren, and many others. Ralph Waldo Emerson, Margaret Fuller, and Bronson Alcott were frequent visitors at Brook Farm; while Hawthorne lived there for a time. George William Curtis and Charles A. Dana were both members. The association maintained a periodical called *The Harbinger*.

References: *Brook Farm*, by Lindsay Swift, New York, 1900; *Memoirs of Brook Farm*, by J. T. Codman, Boston, 1894. There is also an interesting account of the life at Brook Farm in the *Life of Isaac Hecker* (Father Hecker, founder of the Paulist Fathers), by Eliot. Hawthorne's *Diary* contains references to his experiences at Brook Farm, while his novel *Blithedale Romance* is to some extent founded upon his impressions of the place.

BROOKS, JOHN GRAHAM: American economist; born at Acworth, N. H., 1846; was graduated

from Harvard Divinity School, 1875; studied for three years at German universities. He became a lecturer on economic subjects, was for two years instructor at Harvard University, and later lectured for several years in the extension department of Chicago University. Mr. Brooks was appointed expert in the United States Department of Labor in Washington, and in 1893 made a report on workingmen's insurance in Germany. He is president of the National Consumers' League and of the American Social Science Association, and is the author of a book entitled "The Social Unrest." *Address*: 8 Francis Avenue, Cambridge, Mass.

BROTHERHOOD OF THE COOPERATIVE COMMONWEALTH: Organized 1895 with headquarters in Maine. Its avowed objects were: (1) To educate people in the principles of socialism. (2) To unite all Socialists in one fraternal association. (3) To establish cooperative colonies and industries, and, so far as possible, concentrate these colonies and industries in one state until said state is socialized. As a result the colony of "Equality" was organized in 1897 in Skagit County, Wash., with 620 acres. In 1898 this colony became autonomous, since when the Brotherhood of the Cooperative Commonwealth has had a nominal existence only. See EQUALITY.

BROTHERHOOD OF THE KINGDOM, THE: This organization, established in 1892, is the outgrowth, mainly in the Baptist denomination, of the earnest work of two men in New York City, but it now holds yearly undenominational conferences at Marlborough, N. Y., and performs considerable practical work through its members. Its aim is to work for the kingdom of God in the most inclusive sense. (See BAPTISTS IN RELATION TO SOCIAL REFORM.) The principles and methods of the brotherhood are thus stated:

(1) Every member shall by personal life exemplify obedience to the ethics of Jesus.
(2) Each member shall propagate the thoughts of Jesus to the limits of his or her ability, in private conversation, by correspondence, and through pulpit, platform, and press.
(3) Each member shall lay special stress on the social aims of Christianity, and shall endeavor to make Christ's teaching concerning wealth operative in the Church.
(4) On the other hand, the members shall take pains to keep in contact with the common people, and to infuse the religious spirit into the efforts for social amelioration.
(5) The members shall seek to strengthen the bond of brotherhood by frequent meetings for prayer and discussion, by correspondence, exchange of articles written, etc.
(6) Regular reports shall be made of the work done by members in such manner as the executive committee may appoint.
(7) The members shall seek to procure for one another opportunities for public propaganda.
(8) If necessary, they shall give their support to one another in the public defense of the truth, and shall jealously guard the freedom of discussion for any man who is impelled by love of the truth to utter his thoughts.

No sectarian or theological tests are required of members.

The brotherhood has an executive committee of five, with power to manage all ordinary business. The only officer is the secretary, who is also the treasurer. The annual dues are $2, and all funds remaining over and above the necessary expenses are employed in the publication and distribution of literature. Chairman of the Executive Committee, Rev. Leighton Williams, D.D., 312 West Fifty-fourth Street, New York City. Corresponding Secretary and treasurer, Rev. Charles L. Carhart, Dorset, Vt.

BROTHERHOOD OF LOCOMOTIVE ENGINEERS, THE: One of the oldest trade-unions in the United States; not affiliated with the American Federation of Labor. After earlier ineffectual efforts at organization, twelve engineers organized in 1863 a Brotherhood of the Footboard, which in 1864 took the name of the Grand International Union of Locomotive Engineers. William D. Robinson, who is called the father of the Brotherhood, was chosen chief grand engineer (1863). Mr. P. M. Arthur was chosen chief in 1874, and so continued till 1903, largely shaping the character of the Brotherhood, making it one of the strongest, but also one of the most conservative of American trade-unions. His policy was to conduct the Brotherhood on purely "business" principles, and strictly in its own interest, not aiding other unions in strikes, etc., unless it could be clearly proved that it would directly benefit the association. The brotherhood has had few strikes, and no other union has been more successful in obtaining agreements with employers. It has an Insurance Fund, begun 1867. It had (1905) 47,000 members. Its organ is the *Brotherhood of Locomotive Engineers' Journal.*

REFERENCE: *Report of the United States Industrial Commission*, vol. xvii (1901), pp. 821–25.

BROTHERHOODS, RELIGIOUS: Societies organized for philanthropic purposes, most numerous in the Middle Ages. Some of them being established without the authorization of the Church, they fell under the charge of heresy, and in several cases assumed the nature of separate sects, such as the Beghards, Beguines, Apostolic Brethren, Flagellants, etc. The last-named society was subjected to severe persecution by the Church.

The old building corporations, from which sprang the Free Masons, belong under this head. Most of them were regarded with fear and suspicion by the Church, on account of their symbolism and secrecy. The brotherhoods that asked and received the sanction of the ecclesiastics were not secret, but devoted to the promotion of religion by stricter and more constant devotional exercises, or to the assisting of strangers, travelers, the unprotected, the destitute, the sick, and the opprest. The noblest work was often done by these organizations. They were most numerous in Italy, Rome alone containing 100. (See articles COMMUNISM; MONASTICISM.)

BROUSSE, PAUL: French Socialist; born at Montpellier; studied medicine in Paris, becoming doctor in 1867. From 1870 to 1871 he worked on the *Droits de l'Homme*, and in 1871 was condemned to three months' imprisonment. Escaping to Spain, he joined the anarchistic Spanish section of the International. From Spain he went to Switzerland, and meeting there BAKOUNIN, became a leader of the Jura Federation, organizer of the anarchist section in Italy, and editor of anarchist publications. In 1879 he suffered imprisonment in Switzerland, and after his release went to London. Here he met Marx and Engels, and, renouncing anarchism, adopted socialism. In 1880 he returned to France, and edited *Égalité* and *Prolétaire* in 1882, with Malon and his followers, separating from the Guidist Socialists, and forming the "Broussist" section, or so-called "Possiblists." In 1887 he was elected to the Paris Municipal Council, and has since been a foremost leader of one section of the French

Socialists, but ever ready to work with any party, a policy which has resulted in his now calling himself Republican Radical. His main writings are "Le Suffrage Universel et le Problème de la Souveraineté du Peuple" (1874) and "La Crise" (1879).

BROWN, JOHN: American abolitionist; born in Torrington, Conn., 1800. Originally intended for the Church, he was compelled to give up study for this purpose on account of inflammation in the eyes. He then took up the business of a tanner, which he carried on for twenty years. In 1840 he started business as a wool dealer in Ohio, and in 1849 removed to Essex County, N. Y., and began to reclaim a large tract of land which had been granted to him. In 1855, having an intense hatred of slavery, he went to Kansas in order to vote, and fight, if need be, against the establishment of slavery in that territory. He soon became renowned in the fierce border warfare carried on between Kansas and Missouri, and gained especial celebrity by his victory at Ossawatomie. A son of his was killed in one of these affrays, and this tended to deepen his hostility to the Southern Party. After the border agitation had been settled by a general vote, Brown traveled through the northern and northeastern states declaiming against slavery, and endeavoring to incite and organize an armed attack upon it. In October, 1859, at the head of seventeen white men and five negroes, he commenced hostilities by a night attack upon Harper's Ferry, overpowering the guard and capturing the arsenal. The next morning he made prisoners of forty or fifty of the chief inhabitants of the town; but instead of at once retreating to the mountains with arms and hostages, as his original design had been, he lingered on in the town till evening. By this time the townsmen had recovered from their astonishment, militiamen began to pour in, and after a short but desperate conflict Brown and his handful of followers were captured. Brown was tried at Charlestown for treason and murder, found guilty, and sentenced to death on the scaffold within forty-eight hours. He met his death calmly Dec. 2, 1859. It may safely be said that his execution hastened the downfall of slavery in America, and his name has become a household word among abolitionists. He was a man of stern and uncompromising moral principle, and singularly brave and honest. Whatever his rashness or fanaticism, there is no question that he offered himself as a sacrifice to the overthrow of a gigantic social and political wrong.

BRYAN, WILLIAM JENNINGS: American editor, lawyer, and politician; born at Salem, Ill., 1860; educated in public schools, Whipple Academy, Illinois College, Jacksonville (valedictorian), and Union College of Law, Chicago. He practised law at Jacksonville from 1883 to 1887, and afterward at Lincoln, Neb. From 1891 to 1895 he was a member of Congress, and from 1894 to 1896 edited the Omaha *World-Herald*. He wrote the "silver plank" of the Democratic platform and was nominated for the presidency by the Democratic Party in 1896. He made a phenomenal campaign, and received 176 electoral votes against McKinley's 271. In 1897–98 he lectured on bimetalism, and at the outbreak of the Spanish-American War he raised a regiment and became its colonel. In 1900 he was again nominated for the presidency by the Democrats, Populists, and "Silver Republicans," receiving 155 electoral votes against 292 cast for McKinley. "Imperialism" was declared by the platform to be the paramount issue. After the election Mr. Bryan established *The Commoner*, a political weekly, at Lincoln, Neb. In 1904 he supported Mr. Parker, the Democratic nominee for the presidency. From 1903 to 1906 he traveled around the world, and on his return to New York was accorded the greatest ovation ever given to a private American citizen. For his views, see DEMOCRATIC PARTY. *Address*: Lincoln, Neb.

BUCHANAN, JOSEPH RAY: Labor editor of the New York *Evening Journal*; born at Hannibal, Mo., 1851; educated in the public schools. Having learned the trade of a printer, he went to Denver, Col., and engaged in the newspaper business. He became interested in labor and political reform in 1879, and took active part in the movements. For some time he published a labor paper in Denver under great difficulties. In 1887 he went to Chicago, and in the following year to New York. He became prominent in trade-unions, among the Knights of Labor, and in the Union Labor Party. In 1892 he helped to organize the People's Party at Omaha. He was twice a candidate for Congress from the sixth district of New Jersey. Since 1904 he has been a member of the editorial staff of the New York *Journal*.

Buchanan is a Socialist of the opportunist school. He believes in ultimate ownership and operation by the State of all industries of a public nature, and private ownership of those things which are for private use; but in accomplishing change would pursue line of least resistance. He has written "The Story of a Labor Agitator" and many short stories and economic treatises. He is a public speaker of wide experience. *Address*: Montclair, N. J.

BUCHEZ, PHILIPPE JOSEPH BENJAMIN: French communist: born at Matagne-la-Petite, 1796; became a doctor of medicine, 1825. He was one of the founders of the French CARBONARI, and barely escaped condemnation to death for his part in the Belfort conspiracy. He then joined the Saint Simonian school, and worked on the *Producteur*. When this passed into the hands of Enfantin, he left it to found, with Roux Lavergne, a so-called neo-Catholic school, combining Catholic and revolutionary ideas; and from 1831–38, altho with some breaks, he brought out his *l'Européen*. A *résumé* of his ideas appears in his *l'Européen* for 1835, in which he declares that it is time to realize the social principles of Christianity. His idea was to reach communism through industrial cooperation, and in 1831 he founded a cooperative association of cabinet-makers, thus introducing cooperation in France, and to the spread of this movement he devoted the rest of his life. (See COOPERATION.) In the revolution of 1848 he was a follower of Louis Blanc, and was in the chair as president of the National Assembly on the memorable May 15th. After the *coup d'état* of 1851 he returned to his studies and to private life. His main works are: "Essai d'un Traité complet de Philosophie" (1839–40), and "Histoire parlementaire de la Revolution Française" (1833–38 and 1845–47). He died in 1865.

BUFFALO: A city and port of entry in New York State with a population in 1905 of 376,618. Up to the last quarter of the nineteenth century the expression of a social conscience in Buffalo was sporadic. It then began to take form in certain definite movements traceable in the history of the present reform organizations of the city.

Out of the financial stress of 1873 came the Charity Organization Society, the first in America. It was inspired by Rev. S. Humphrey Gurteen, from England, then rector of St. Paul's Church, Buffalo, and it followed the lines of the London Society. Some of the strong men who founded it are still with it, and through them its scope and influence have steadily increased. The society is chiefly remarkable for its church district plan, whereby 122 churches, of all denominations, have accepted responsibility for the relief needed in certain defined neighborhoods.

History

The advantages of this system are the volunteer visitors thus made available and the education and coordination of the usually ineffective church relief. The main disadvantage is the difficulty of insuring that a family placed in care of a church will have the benefit of adequate aid and constructive effort. This is met by careful supervision of the work of uncertain churches, families being removed from their care when necessary. Four of the largest churches have established social settlements in the districts for which they are responsible, thus coming in close touch with the individuals intrusted to them, and bringing to bear upon the neighborhood what social and educational influences are possible. In the last ten years, through the efforts of the Charity Organization Society in these ways, the city outdoor poor relief has been reduced from $118,000 to $32,000 per annum, and the number of families thus aided from 4,166 to 880. There being no other strong organizations for improving the conditions of the poor, this society has taken a leading part in attacking the social causes of poverty, in enacting and enforcing laws drawn with this end in view, and in establishing and maintaining such admirable institutions as the Fresh Air Mission and the Fitch Crêche. The following special committees, all of them active, indicate the scope of this broader work: Fitch Crêche, Tenement House, Tuberculosis, Penny Savings, Children, Defective Children, Mendicancy, Public Lodging House, Family Desertion, and Public Playgrounds.

Another of Buffalo's oldest and strongest organizations is the Civil Service Reform Association. Organized in 1881, it took an active part in a campaign for the national civil service law which was passed in January, 1883, and for the state law which was signed by Grover Cleveland in May, 1883. It is worth remarking that George William Curtis said of this campaign, "There is no force in the country more united, enthusiastic, and effective than the Buffalo contingent." Buffalo was one of the first three cities to adopt municipal civil service rules, in Jan., 1885. The progress made since then is found in the fact that in 1884 only 7 per cent of all city offices were filled by competitive examination; in 1889, 49 per cent; in 1894, 75 per cent; in 1900, 84 per cent; and in 1906, 87 per cent.

In 1894 a subcommittee of this association organized the Good Government Club, which had a useful existence of six years. Three years after this ceased to exist, there arose, as an entirely separate and new movement, the present Municipal League. This organization is energetic and fearless, and has attained a large measure of success. This is due, perhaps, to the fact that it not only publishes before election the records of candidates for office, but openly and actively works for the best men and the best measures.

The status of municipal ownership in Buffalo may be judged by the fact that the Municipal Ownership League has been lost to sight and hearing. The only experiment in this direction is the water-works, and there is small sentiment for anything further. Indeed there is lacking that very public consciousness which it is claimed municipal ownership develops. An example of this is the failure of the public to agree on a site for the much-needed union station, a perennial subject of public discussion. The various reform organizations of the city are able to inspire strong support, however, and though, as in most cities, this is from a limited number of social servants, yet the city as a whole has waked to united action, as at the time of the Pan-American Exposition; and it is through such organizations and special efforts that a public consciousness is developed. The city is divided by Main Street into the East and West sides, and it would take a strong body to fuse these, and other factions, as it would to free the city from the grasp of the railroads. The organization best fitted to fulfil this function is the Chamber of Commerce, and there are already indications that this competent body is waking to its opportunities and responsibility.

An important step for the future of progressive, united public opinion in Buffalo has been taken within the year in the organization of the Civic Conference. The following business and social reform associations are affiliated with this conference and meet monthly for the discussion of problems affecting the common welfare: Chamber of Commerce, Manufacturers' Club, Black Rock Manufacturers' Association, Society for Beautifying Buffalo, North Buffalo Business Men's Association, Builders' Exchange, West Side Business Men's Association, Municipal League, East Buffalo Business Men's Association, Buffalo Credit Men's Association, Retail Grocers' Association, Charity Organization Society, Referendum League, Mutual Progressive Association of Walden Avenue, North East Buffalo Business Men and Citizens' Association, South Buffalo Citizens' Association.

Three fourths of the population of Buffalo are foreigners, largely Germans, Italians, Poles. A splendid system of schools, a remarkable public library, good tenement laws, well enforced, progressive labor laws, also enforced, and a strong Board of Health have prevented conditions of life and work from reaching the unmanageable stage of larger cities. The death-rate (14.14 per thousand) is phenomenally low. There are but few large tenements, and the houses are detached and present throughout the city an appearance of comfort, thrift, and pleasantness unsurpassed by any city in this country. At the same time there are communities sprung up about some of the large industries—one, especially, just outside the city line—which present conditions that cry for betterment. The city has made a beginning, with two public-bath

Conditions

stations, six playgrounds, and various parks, to meet the growing population in the crowded quarters, but it is only a beginning. The system of parks, most of them out from the crowded districts, is extensive and beautiful, though not yet completed. It includes a zoological garden, a botanical garden, ponds for boating and skating, and a wading pool. In one park is situated the Albright Art Gallery, perhaps the most beautiful in the country, and near it the Historical Building. At both of these buildings frequent public lectures are offered, and are well attended, as are those of the Natural History Society.

The Buffalo Public Library deserves special mention, for hardly a library in the country has a circulation so wide in proportion to the population. Its elaborate system of school libraries is also remarkable.

Another institution common to all cities but beyond the ordinary here is the Young Men's Christian Association. The main building is one of the finest of its kind in the country, and is used in such a way as to make it a strong influence in the community.

Two young but active organizations for social reform are the Consumers' League and the City Federation of Women's Clubs, mentioned together because they are both composed for the most part of women. The former is especially effective in enforcing the child labor laws; and the latter has taken up the cause of children in the matter of school lunches and medical examination.

The Society for Beautifying Buffalo, now in its sixth year, has accomplished something, and is on the way to become a strong organization for making Buffalo a beautiful and healthful community. Its committees are on Sculpture and Monuments, Playgrounds, Home Cultivation of Flowers, Abatement of Smoke Nuisance, Forestry, Architecture, Removal of Overhead Wires, Billboards and Signs.

The labor-unions in Buffalo are not strong. There are 174 local unions with a membership of 29,590, a gain of 4.2 per cent over a year ago. There have been no distinguished leaders, and no great battles to enlist working men. They have had a steady growth, following rather than leading the general development of organized labor, but their influence in the city to-day is not profound. The strongest organizations are to be found in the building trades and railroads. *Progress*, the official organ, has a circulation of 40,000, and does much in the way of education concerning social-reform movements.

Socialism in Buffalo is a wavering light. There are the usual two parties, the Labor Socialists being the more active, but either going little beyond weekly discussion.

Buffalo is on the eve of an important political event in the shape of a new city charter. It was prepared in skeleton form by an eminently fit commission and has the backing of most intelligent citizens. It provides for the election by the people of but two of the administrative officials, the mayor and controller, all others to be appointed, and for the establishment of but one house in place of the present Board of Aldermen and Council. It is believed that this will center the attention of voters upon the vital points, and focus responsibility. It should do much to rid Buffalo of the inefficiency and petty graft that still persist in spite of the fact that the balance of power is held by the independent voters. Headquarters of some of the civic societies in Buffalo:

Central Labor Union, 37 East Huron Street.
Chamber of Commerce, Chamber of Commerce Building.
Charity Organization Society, 19 West Tupper Street.
City Federation of Women's Clubs, 485 Auburn Avenue.
Civic Conference, Chamber of Commerce.
Civil Service Reform Association, 19 West Tupper Street.
Consumers' League, 404 Seneca Street.
Corrupt Practices Society, Fred Gratwick, Ellicott Square.
Municipal League, Ellicott Square.
Neighborhood House, 79 Goodell Street.
Referendum League, Louis Stockton, Erie County Bank Building.
Society for Beautifying Buffalo, 37 Allen Street.
Social Labor Party, 19 West Mohawk.
Watson House, 282 Babcock Street.
Welcome Hall, 404 Seneca Street.
Westminster House, 424 Adams Street.
Women's Educational and Industrial Union, 86 Delaware Avenue.
Young Men's Christian Association, 45 West Mohawk Street.
Young Women's Christian Association, 19 West Mohawk Street.

JOHN R. HOWARD, JR.

BUILDING ASSOCIATIONS: Cooperative organizations, created for the purpose of encouraging wage-earners and others in the systematic saving of small sums by making periodic payments on stock; and of utilizing such accumulated sums in making advancements or loans to their members with a view to assisting them in buying or building homes. As commonly applied, the term "building association" includes building and loan associations, mutual loan associations, savings-fund and loan associations, cooperative banks, cooperative savings and building-loan associations, and homestead associations, all of which have the same general features. They derive their rights and powers from the statutes of the different states in which they are organized, and while their general purposes and aims are substantially the same, they differ widely in details of management and methods of operation.

The origin and early history of building associations is a matter of some doubt, altho it is known that they existed and flourished several hundred years before the Christian era. John Henry Gray, in his work on the "Laws, Manners, and Customs of the People of China," gives an interesting account of how these societies were first established by Pong Koong, a man of great wealth during the Hon dynasty. They were recognized institutions of that country as early as the year 200 B.C., having some of the prominent features of later building and loan associations, such as the payment of dues and interest at stated periods, competitive bidding for loans, repayment of loans in instalments, a system of fines for non-payment, and an equal division of profits. In England such societies existed as early as 1781 ("Johnson's Universal Cyclopædia"), and "building clubs" were known in Birmingham in 1795. The first association concerning which there is definite information is the Greenwich Union Building Association, established in 1809, and mentioned in "East's English Reports" (Pratt *vs.* Hutchinson, 15 East, p. 511). In Scotland, such associations were organized by the Earl of Selkirk in 1815. The first building association in the United States was The Oxford Provident Building Association of Philadelphia County, organized Jan. 3, 1831, at Frankfort, Pa., now within the corporate limits of Philadelphia. The constitution and by-laws provided for a payment of $5 for membership fee, and a monthly payment

Origin and Early History

of $3 per share. A loan of $500 per share was authorized to the stockholders offering in writing the highest premium. No member could hold more than five shares; and at the semiannual elections each member was entitled to one vote for each share of stock held. The association was to continue until every member had an opportunity of purchasing a dwelling-house, after which the assets were to be divided. A fine of twenty-five cents per share for failure to pay the monthly dues was provided, as well as a fine of twenty-five cents for appearing intoxicated at a meeting. The Oxford Provident matured in ten years, and a second association, bearing the same name, was organized Jan. 30, 1841; this matured in March, 1852, and was followed by a third association, likewise bearing the same name.

From Pennsylvania the cooperative movement spread with wonderful rapidity, until now there is scarcely a state in the Union in which building and loan associations are not operating. Associations were organized in other states as follows: Maryland, 1843; New Jersey, 1847; Illinois, 1849; New York, 1851; Massachusetts, 1852; Ohio, 1857; Georgia, 1866; Texas, 1867; Kansas, 1868; Minnesota and Arkansas, 1869; North Carolina and Iowa, 1870; Louisiana and Tennessee, 1873.

The fundamental principles underlying these associations may be stated as well given by Judge Seymour Dexter, in an address delivered before the United States League of Building and Loan Associations, at Put-in-Bay, 1902:

Fundamental Principles

First: The bed-rock foundation principle of the successful building and loan association movement in America is direct financial cooperation by men of comparatively limited financial resources in the matter of building and owning homes.

Second: The next important principle in the superstructure to be reared on this bed-rock foundation principle, is the payment by these men into a common fund, in regular periodic payments, the sum of which they have severally agreed to pay; to the end that the sum total of such periodic payments will amount to a sum sufficient to be used advantageously by some one contributing to the common fund, in building or buying a home, and for the use of which he pays interest into the common fund and gives a satisfactory security for the accumulated fund thus received, and in addition to the interest continues to pay his regular periodic payments, which are accumulating to pay back the sum he has received, and if continued long enough will equal and cancel such amount.

Third: That the necessary machinery may be set in motion to easily, economically, and safely put these principles into operation, the men proposing to contribute such regular periodic payments unite to form an association, under the laws of the state in which they reside, that they may have corporate powers, elect from their own number officers executive, as a president, vice-president, secretary, and treasurer, and a board of directors, and of this board the executive officers are *ex-officio* members—these officers to be elected annually.

In the association the amount of each periodic payment which each is to make is represented by shares, and those contributing to the common treasury are known as shareholders.

Fourth: The fundamental principles of this association are:

The shareholders are localized; they reside chiefly in the village or city where the association is located.

All the meetings of its board of directors are open and may be attended by any shareholder.

Loans from the common fund are made only to its own shareholders, and if a person wishes to borrow who is not a shareholder, he must unite with the association and become a shareholder before he can become a borrower.

Every shareholder who can give satisfactory security is equally entitled to borrow the funds of the association.

The loaning of its funds is made at periodic times, fixt by the association, of which every shareholder has due notice, at an open meeting; and in the event two or more shareholders want to borrow the same money, the right of priority to a loan is settled by an open bidding for such right of priority, any sum bid above regular periodic interest inuring to the benefit of the common treasury, and through it to all shareholders alike.

A premium is not a fundamental principle in the building and loan association scheme, except to settle right of priority to a loan when two or more shareholders, having each satisfactory security to offer, want to borrow the same money at the same time.

A system of fines for default in payment of dues or interest at or before the periodic time fixt for such payment, such fine not being imposed for the purpose of revenue to the treasury, but as a penalty for tardiness, to stimulate shareholders to prompt payment and the formation of the habit of prompt payment of an obligation at or before the time it is due.

The Board of Directors, except the secretary and treasurer, rendering their services to the association without receiving pay for such services.

No agents paid a commission or other specific sum for securing new shareholders to join the association.

Mutuality in the mode of distributing profits, so that every dollar paid into the common treasury in the form of dues, interest, or other incidental income, shares equally.

That when a free shareholder withdraws his shares and receives his accumulations, he shall be obliged to leave a certain percentage of the profits credited to his shares, which reverts to the association, that percentage being large enough to insure against loss upon the loans in which his accumulations have been invested.

The building and loan association is practically a cooperative savings-bank. It differs from the ordinary savings-bank mainly in its methods of receiving deposits and lending money. Its chief advantage for the people over the ordinary savings institution is that its funds are used by the members themselves to advance their own interests, while the funds deposited by wage-earners in the old line savings-banks are largely borrowed by business men and corporations, and used to advance the interests of capital. Another point in favor of the building and loan association is in the fact that every member has a voice and vote in the management of it, and shares in the total profits. Every member is a stockholder, and therefore entitled to all the rights and subject also to all the liabilities of a stockholder.

Varieties

There are three forms of these associations: (1) The original, known as "terminating," now no longer in use; (2) the serial; and (3) the permanent. In the terminating association all members were supposed to commence their payments at the beginning of the association; but when stock was issued subsequently, the member was required to pay back dues equal to the payments made by members who started with the association, and usually in addition a bonus to make the new shares equal in value to those of his fellow members. There was no distribution of profits. The earnings were kept intact until the association was ready to close its business, when they were divided pro rata to all shareholders. All stock being of equal value, the life of the association was limited to the time required to mature the par value of the shares; when the non-borrower received the full value of his stock, the mortgage of the borrower was canceled, and the affairs of the association wound up.

The serial association was the first attempt to remedy the defects of the terminating society. Under this plan members join the association in series, which are issued at regular intervals of usually three or six months. Each series is practically a terminating association, except that the earnings, instead of being kept intact, are distributed at regular intervals before the opening of a new series, and the principles of copartnership applied in the distribution of profits. Each series of shares runs independently of the other and matures separately, the values of the shares in the same series being kept equal. New members are required to pay back dues only to the date of issue of the last series. This plan obviates the objection of a liquidation of the association every ten or twelve years. Each series is matured whenever the monthly or weekly dues, together with the distributed earnings, equal the face value of the shares. New series being regularly issued, the association itself becomes perpetual. When a person enters the membership of a serial association he pays a membership fee, and subscribes for one or more shares of stock on which he agrees to make a monthly or weekly payment of fifty cents or one dollar per share until maturity of the series or withdrawal before then. Should he fail to pay his monthly or weekly instalment or dues within the required time, he is called upon to pay a fine into the treasury of the association. Should he at any time transfer his shares of stock to another person, payment of a fee is required for making the transfer on the books of the association.

The permanent association differs from the serial association in that a person may become a member of it at any time without paying back dues. In a permanent association the profits are divided annually or semiannually among the members, and credited to their respective accounts. The shares of each member are dealt with separately in conducting the affairs of the association. A person may withdraw from

either a serial or a permanent association at any time with a share of the accumulated profits. In a serial association the percentage of profit that may be taken out by a withdrawing member is generally fixt by the rules of the association at a lower rate than is awarded the member who stays in the association until the series matures. This is done to insure the participation of the withdrawing member in any possible and unforeseen losses that may befall the association. In permanent associations the withdrawing member usually is entitled to receive the actual dividends declared to his shares, provision for the payment of any losses being made by setting aside a portion of the profits at each periodical distribution to a contingent fund from which all losses are paid. In some states both serial and permanent associations are required to set aside to such a fund a certain percentage of their profits before distribution, to insure the equal participation of all members in the losses of the association. Originally, in the permanent associations, all the stock issued was paid for in weekly or monthly instalments of dues. Later, what is now known as "paid-up stock" was also issued. The full face value of this stock is paid for at one time and the member receives thereon regular semiannual or annual dividends in cash. With these exceptions paid-up stock is practically the same as running stock, and shares the same rights and liabilities. It is not issued at all times, but only when the association can profitably loan the money; and it may be called in and paid off if the association has no use for the funds. The member has the right to withdraw it at any time, just as running stock. Paid-up stock is of great advantage to associations in that it furnishes and makes available for loaning purposes larger amounts of money than can be accumulated from instalment stock.

General Methods and Characteristics

In a building and loan association a member subscribes for one or more shares of stock, on which he pays a certain weekly or monthly amount, denominated "dues," till the aggregate sum paid in, plus the dividends credited, amounts to the face value of the stock; when the member is entitled to receive from the association in cash the face value of the shares held. The difference between a stockholder in a building association and a stockholder in an ordinary corporation, is that in a corporation the stockholder usually pays the full value of the stock upon acquiring it; while in a building association the member, by small payments and dividend accretions, matures the face value of the shares. The funds of a building and loan association are made up of membership fees, dues payments, and moneys received from sale of stock, interest on loans, premiums for priority of loans, fines for non-payment of dues, and fees for transferring stock. The income of the association is augmented by low expenses, the officers (except the secretary, treasurer, and attorney) usually serving without pay.

When a member desires to buy or build a home, he endeavors to borrow from the association as much as he may require for the purpose, by obtaining an advancement of the par value of his shares. He applies to the association when it has money to loan; and if he offers a higher premium for the use of the money than any other member, the loan is awarded him. On securing the right to the use of the money, he designates his proposed real estate security; and when the title has been approved by the association's attorney and the security found ample by the association's appraisers, being usually required to be one third more in value than the loan applied for, the money is advanced him, and he gives the association a mortgage on the property for the amount. He also assigns his stock to the association and agrees to keep up his required payments thereon. After securing the loan, the borrower also pays to the association, in addition to his regular dues, premium and interest on the loan. When the face value of the borrower's stock is equivalent to the amount of money loaned him, the association applies the stock to the payment of the mortgage, and the member has his canceled mortgage returned to him. The borrower is not, however, required to continue his loan until maturity. Should he desire to pay it off sooner, he can at any time have the value of his shares applied to the cancelation of the loan; and by paying in one sum the balance still due, he can have his mortgage canceled. In case of default in payments for a stipulated time, usually provided in the by-laws, the entire loan becomes due and payable, and the association then has the right to recover for balance due on the loan by foreclosure of the mortgaged premises.

The premium referred to is a payment over and above interest, intended as a bonus for the right of priority in securing a loan, the borrower agreeing to pay a stipulated sum as compensation for the present use of the money advanced him. The original form was known as the "gross premium plan," in which the premium bid was deducted from the loan, the borrower receiving the difference in cash, altho required to pay interest on the face value of the shares loaned until the full face value of the shares was matured. The "net plan," which was the next form, was a modification of the gross plan, the borrower being required to pay interest only on the net amount of money received as a loan, the premium being deducted in advance as under the gross plan. Under the "instalment plan," which became the most popular form, the borrower receives the full face value of his shares, and agrees to pay a certain number of equal monthly or weekly payments as premium, usually a certain number of cents per share, which payments are continued during the term of the loan. The premium is, however, coming in to disuse in the evolution of the building association scheme, mainly because interest rates have declined; and where interest rates are within the legal limit, loans are usually made at a straight interest rate without a premium, the right of precedence to a loan being determined by the board of directors, either according to the order in which the applications were filed, or according to the security offered.

Building and loan associations have long been recognized as exerting a most beneficial influence upon the community, so that the states, and even the national government, have accorded them exemptions from many forms of taxation. Thus, under the War Revenue Act, building associations which made loans only to their members were exempt from stamp taxes on all documents executed by them, except checks and drafts. In most states they are exempt from the usury laws. There are also exemptions from taxation on shares of stock, on mortgages, and on securities. These special favors and privileges are accorded these associations on the theory that they promote thrift, encourage home-owning, and thereby increase the amount of taxable property, so that the state can well afford to grant them these special rights.

Statistics

The first reliable statistics concerning the building and loan associations of the United States are contained in the ninth annual report of the U. S. Commissioner of Labor, published in 1893. There were at that time 5,598 local and 240 national associations, a total of 5,838. The total assets of the locals were $473,157,454; of the nationals, $55,715,431; a total of $528,852,885. Of the 5,838 associations in the country, 5,796 reported the total shareholders and 4,269 reported

the number of male and female shareholders. The total number of shareholders was 1,745,725, an average of 301.2 shareholders to each association. The number reported according to sex was 1,227,442, of whom 919,614 were males and 307,828 females; 5,776 associations reported 456,004 borrowers, an average of 78.9 borrowers to each association; 4,444 associations reported the number of homes acquired by their borrowing shareholders as being 314,775. In 4,422 associations reporting, 28,459 buildings other than homes have been secured. The total number of mortgages foreclosed was reported by 5,440 associations as 8,409, having a value of $12,217,126, the loss on such foreclosures being $449,599. The department also undertook to ascertain facts as to the kind of people who patronize building and loan associations, to learn if the original purpose of these associations, which is to enable persons of small means to secure homes for themselves and to save their earnings, had been preserved. It was impossible to learn the occupations of all the shareholders in all such associations; but it was learned that in 909 local associations, reporting 159,223 shareholders, 111,383, or 69.96 per cent, were practically working people. In 12 national associations, reporting 15,547 shareholders, 8,403, or 54.06 per cent, belonged to the working class. The department therefore concludes that "these figures show conclusively that the building and loan associations of the country are being used by the classes for which they were originally established."

In November, 1904, the Department of Commerce and Labor issued a bulletin (No. 55) on "Building and Loan Associations of the United States," in which is considered very fully the origin and growth of these associations, their fundamental principles, plans of issuing shares and making loans, treatment of distribution of profits, withdrawal plans, etc. The report says:

> Some estimate of the great financial importance of these institutions may be gained by an inspection of the following table, which shows the assets of building and loan associations for each year from 1893 to 1903, inclusive. The figures in this table have been compiled from the reports of the various states exercising supervision over these associations, and have been estimated from the remainder of the country. These assets consist chiefly of loans secured by real estate owned by members of the associations, altho a certain proportion consists of loans on other collateral, cash on hand, real estate, and property owned by the associations, etc.
>
> Reference to the total of this table shows that in the year 1893 the assets of these institutions had reached the enormous figure of $528,852,885. As was observed in the report which covered the year 1893—
>
> A business represented by this great sum, conducted quietly with little or no advertising, and without the experienced banker in charge, shows that the common people, in their own ways, are quite competent to take care of their savings, especially when it is known that but thirty-five of the associations now in existence (1893) showed a net loss at the end of their last fiscal year and that this loss amounted to only $23,332.20.
>
> In 1894 the assets had increased by 74 millions of dollars to a total of nearly 603 millions; in 1895 they had increased by 22 millions to nearly 625 millions; in 1896 an increase of 27 millions brought the total up to nearly 652 millions; while in 1897 the year in which the greatest assets are shown, an increase of 13 millions of dollars brought the total up to nearly 665 millions. During the following four years, 1898 to 1901, the assets of these institutions had decreased by 59 millions of dollars, a relatively small amount, bringing the total down to approximately 606 millions, but in 1902 an increase of nearly 4 millions is shown—the assets for this year being $609,599,096, or over 80 millions more than the assets shown for 1893, the first year of the decade, by the report of the Department of Labor. In 1903 there was a considerable decrease in the total assets, due to the failure of a large company in New York and to the fact that several large building and loan associations in Ohio were organized into trust companies.
>
> Considering the figures shown for 1903 for the various States, it is seen that Pennsylvania ranks first with 1,196 associations, having assets of nearly 118 millions of dollars.

ASSETS OF BUILDING AND LOAN ASSOCIATIONS, 1893 TO 1903

STATE	1893	1894	1895	1896	1897	1898	1899	1900	1901	1902	1903

The principal periodical in the United States devoted exclusively to building and loan association interests is *The American Building Association News*, published monthly in Chicago and Cincinnati. This is the official organ of the United States League of Local Building and Loan Associations, and of a large number of the state leagues. Its files are a valuable source of information regarding building associations.

The United States League of Local Building and Loan Associations, composed of representatives of the several state leagues of building associations, was organized in Chicago, Ill., April 15, 1892, and meets annually in different parts of the United States. Judge Seymour Dexter, of Elmira, N. Y., was its founder and first president. It has for its motto: "The American Home: the Safeguard of American Liberties." Its proceedings are printed yearly, and form a valuable contribution to the literature on the subject.

Building associations exist also in Europe in considerable numbers, tho not to such an extent as in the United States. For information in regard to them, see Cooperative Banks.

H. F. Cellarius.

References: Among publications treating of building and loan associations, those deserving special mention are: *Treatise on Cooperative Savings and Loan Associations*, by Seymour Dexter, New York, 1889; *A Treatise on Building Associations*, by Charles N. Thompson, Chicago, 1892; *How to Manage Building Associations*, by Edmund Wrigley, Philadelphia, 1880; *The Working Man's Way to Wealth*, ib.; *Building and Loan Associations* in *Bulletin* (No. 55) *of the Bureau of Labor* (Department of Commerce and Labor), Nov., 1904; *Proceedings of the United States League of Local Building and Loan Associations* (published annually since 1893).

BUILDING TRADES, UNIONS IN THE: These are among the larger and more important labor-unions, which in recent years have had especial attention drawn to them, because of a considerable number of large and unusually complicated lockouts, strikes, prosecutions of walking delegates, and other labor difficulties that have developed in various cities, and especially in Chicago and New York.

There seem to be two reasons why the building trades have had more labor difficulties than in most lines of industry. The first is the large number of distinct trades and crafts, often engaged at the same time on the same building, each with its separate local and national organization, any one of which is able, by calling out its men, to embarrass the contractor and seriously delay if not render impossible the work of the other crafts engaged upon the building. The second reason is that since in the United States, unlike methods in England and Europe, the various processes of building are usually sublet to subcontractors by the general contractor who does perhaps the masonry, the subcontractor, doing often only a few days' work on a building, can if he will violate a trade agreement with a union and yet finish his job before the union can hold a meeting and call a strike, with the result that the various building trade-unions have been compelled to lodge more authority with their agents as to strikes than is the case in most trades. The result of these two facts, the number of distinct trades involved in one place at one time, and each with a walking delegate entrusted with unusual power, has developed situations of extreme complexity and confusion, alike to employers and employees. This situation has led to more factional and jurisdictional fights between crafts, and even between rival organizations in the same craft, than in most trades. Sometimes contractors have had to endure vexatious delays while rival unions have fought as to which should do a certain job. The United Board of Building Trades in New York has had generally some 70 local unions represented in it. The Building Trades Council of Chicago represents 32 trades with some

30,000 members, while the distinct Building Material Trades Council of Chicago has some 43 unions with 33,000 members. These boards and councils, composed of the walking delegates of these unions, meeting originally simply to consult unofficially and to aid one another in getting the best conditions for their unions from various contractors, have almost invariably developed great power. The building trades represent to a large extent skilled laborers quickened and not seldom demoralized by city commercial life. A contractor wanting a large number of skilled men, but perhaps only for a few days, must get his men through collective bargaining. He cannot take time generally to engage a man here and a man there. Hence the power of the walking delegate, who has his men in hand, a power probably generally used by the walking delegate for the good of the men—hence largely high wages in the building trades—but also a power admitting of great evils. Walking delegates have learned to sell their power usually for the benefit of their unions but sometimes for their own pockets. Contractors have been willing to pay large sums —many believe that the first offers came from contractors—to call off strikes. Contractors have even been willing to pay to have strikes called upon rival contractors or to have paid emissaries in the ranks of the walking delegates. (See WALKING DELEGATES.) "Graft" has undoubtedly largely been used both by walking delegates and contractors.

The first Board of Delegates in the building trades in New York dates from 1884, but had little power. By 1890, however, it had become strong, till in 1894 it divided into two hostile boards which in 1902 merged in the United Board of Building Trades of New York, and it was hoped both by employers and employees that this would end the confusion of the building situation. Corruption, however, soon developed. One firm was said to have paid $2,000 to have a strike called off.

Sam Parks (see WALKING DELEGATES), business agent of the structural iron workers, developed his phenomenal power and began his corrupt career. The George A. Fuller Company was accused of having brought him from Chicago and of backing him financially to secure immunity for their enterprises, which, honestly or dishonestly, they certainly had. Charges and counter charges were made.

The year 1903 saw protracted and almost continual strikes in the building trades. Finally, through the efforts of the New York Civic Federation, a Board of Governors of the employers and representatives of eighteen unions held a conference and a General Arbitration Board was organized composed of two arbitrators elected by each employers' association and two elected by each union. Only members of unions party to the agreement are to be employed, and the employees are to enforce this clause on all contractors. Employers cannot order a lockout nor the unions a strike before the matter in dispute is brought before the General Arbitration Board and settled.

In Chicago there were conditions at least as complicated, a strike much more violent, a connection with disreputable politics, and corruption probably much more open and general, ending in a victory for the employees, tho the better elements in the unions have combined with the contractors to form a new Chicago Building Trades League, largely on the same lines as the New York agreement.

For main unions in the building trades, see under their respective names.

J. R. COMMONS.

REFERENCE: *Trade Unionism and Labor Problems*, ed. by John R. Commons (1905), chapters iii. and iv.

BUONARROTI, PHILIPPO: Communist; born in Pisa in 1761. On account of his revolutionary ideas he was early compelled to flee to Corsica, and published there his "Friend of Italian Liberty." In 1792 he came to Paris, and was naturalized. For complicity with the conspiracy of BABEUF he was condemned to deportation. After much suffering he escaped to Geneva, and later to Brussels, where he wrote his "History of Babeuf's Conspiracy" (1828). In 1830 he returned to France, and secretly worked for communism, exerting much influence upon Blanqui and other leaders. He died in 1837.

BUREAU OF ECONOMIC RESEARCH: Established in New York, 1899, by Geo. H. Shibley; removed in 1900 to Washington, D. C. It has conducted investigations into railroad consolidations in Massachusetts and into trusts, wholesale prices, freight rates, and certain gas plants. Since 1901 Mr. Shibley has devoted the efforts of the Bureau mainly to direct legislation, having established also a People's Sovereignty League, of which he is president. *Address*: 11 Bliss Building, Washington, D. C.

BURGESS, JOSEPH: English Labor leader; born at Failsworth, Lancashire, England, 1853. At the age of eight he worked part time in a cotton mill; at eleven, he worked full time. In 1884 he became a journalist in the interests of labor, editing *The Oldham Operative*. From 1885 to 1889 he was on the editorial staff of *The Cotton Factory Times*, from 1899 to 1891 he was manager of *The Yorkshire Factory Times*, and from 1891 to 1894 editor of *The Workman's Times*, London. In 1892 he published proposals for the founding of an independent labor party. This party was founded in 1893, and Mr. Burgess was elected a member of the first national administrative council. He was the party's candidate for Parliament at a by-election in Leicester, 1894, and at the general election in 1895, and has served as organizer for the Independent Labor Party both at Leeds and in Glasgow. Elected in 1902 to Glasgow Town Council, he contested, in 1906, the Camlachie Division of Glasgow. Mr. Burgess has fought all his elections as a Socialist, against Liberal and Tory candidates. He is the author of several stories evidencing his interest in labor. *Address*: Factory Times Office, Huddersfield, England.

BURIAL SOCIETIES: Friendly societies found mainly in England, constituted in the usual manner, but with the express object of supplying a fund for paying the funeral expenses of the members on their death. (See FRIENDLY SOCIETIES.) It became customary to enter the names not only of adults, but of children, in such societies. The proceedings of the criminal courts have shown that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances was enhanced by the discovery

that children were frequently insured in more than one society. Legislation in England was enacted to remedy this. In the United States burial societies have had little development, their place having been filled by provisions embodied in the various friendly societies, secret orders, or trade organizations.

BÜRKLI, KARL: Swiss Socialist, born in Zurich, 1823. He became a tanner, and was converted to socialism (1845) by the writings of Fourier. Bürkli founded the first *Konsumverein* in German Switzerland, and in 1851 was elected to the Cantonal Council because of his socialist program, and advocacy, for the first time in Switzerland, of direct legislation. Since then he has played an important part in Swiss politics as a firm Socialist. In his seventieth year he opened the Zurich International Congress. He has been a voluminous writer from 1851–91.

BURNS, JOHN: Political labor leader, born at Battersea, London, 1858; son of an engineer. He began to earn his own living at the age of ten, working in a candle factory, his first wages being three shillings a week. Later he was apprenticed to a local engineering firm. Burns early became an enthusiastic trade-unionist, and in 1877 was arrested for persistently speaking on Clapham Common. On being released (in 1879) he joined the Amalgamated Society of Engineers, and prominently advocated shorter hours. In 1880–1881 he was engaged as an engineer in West Africa. In 1883 he became a Socialist, and joined the Social Democratic Federation, becoming its leading working-class member, but also an omnivorous reader and student. In 1885 he stood as Socialist candidate for Nottingham, and received 598 votes. For two years he led the "unemployed" agitation in London. In 1886 he was arrested with Hyndman and others for speaking in Hyde Park, and on acquittal his speech ("The Man with the Red Flag") was printed and widely sold. On Nov. 13, 1887 ("Bloody Sunday"), he was imprisoned six weeks for breaking through the police lines, and speaking in Trafalgar Square. In 1889 he was elected to the London County Council from Battersea. The same year he showed marvelous skill in managing the Dock Strike, and in organizing the unorganized; and he became the foremost leader of the "new unionism." Coming to believe in the "progressivist" policy of advancing socialism through any party, he left the Social Democratic Federation, and has been criticized by its leaders ever since, at times even being considered by them a traitor to their cause. At the general election in 1892 he was easily elected M. P. for Battersea, and in 1893, receiving the highest number of votes at the Trade Union Congress, became chairman of the Parliamentary Committee.

On the London County Council Burns's work has been continuously good and increasingly onerous, and he has had a large share in its onward march. The attitude of its Works Committee, with fair wages, hours, and conditions of labor, and its system of direct employment without contractors, is largely due to him. In Parliament his work has been none the less solid: witness the adoption of the eight-hour day in government workshops, and his interest in all reforms. Burns has been steadily reelected from Battersea, including the election of 1906. He is an independent trade-unionist and Socialist, and altho increasingly denounced by the extremists in the labor movement, who do not believe in his opportunist methods, he has gained the admiration and confidence of all parties wherever he has served: on boards of arbitration between employers and employees, in Parliament, and in positions of trust. He is a total abstainer and strenuous for justice to all. In December, 1905, he was asked by the Liberal prime minister, Mr. Campbell-Bannerman, to enter the Cabinet as president of the Local Government Board, the first English workingman to be a Cabinet officer. He has a salary of £2,000, and has charge, among other things, of the great movement and fund authorized by Parliament for the unemployed. *Address*: 37 Lavender Gardens, Battersea, London, S. W., England.

BURROWS, HERBERT: English Socialist, born in Suffolk, England, 1845. The son of a Methodist local preacher, he studied at a private school and entered the civil service. He was one of the original founders of the Social Democratic Federation, of which he is still a member, and to the cause of which he has devoted himself so energetically as on occasions to deliver seven addresses a day. He was one of the organizers of the dock laborers, and has represented the federation in several Socialist congresses. In 1895 he was treasurer for the Match Girls' Union, and a very active friend of its cause. He is interested in theosophy, as well as socialism, and secretary of the Match Makers' Union. *Address*: 99, Sotheby Road, Highbury, London, N., England.

BURT, THOMAS: Member of Parliament; born in Northumberland, 1837; the son of a miner. Following his father's profession, he became secretary of the Northumberland Miners' Union in 1865. In 1874 he was elected to Parliament from Morpeth, with Alexander Macdonald, the first "labor member" to sit in Parliament. He has represented Morpeth ever since. Burt is president of the Miners' National Union (since 1882); was British representative at the Labor Conference in Berlin, 1890; president at the Trades Union Congress in Newcastle-upon-Tyne, 1891; and has been active on various commissions, etc. In politics he is a Liberal. *Address*: 20, Burdon Terrace, Newcastle-upon-Tyne, England.

BUTLER, BENJAMIN F.: American lawyer; politician; born at Deerfield, N. H., 1818; was graduated at Waterville College, Maine; studied law at Lowell, Mass., and was admitted to the bar in 1841. He soon became distinguished as a criminal lawyer and Democratic politician. In 1853 he was elected to the Legislature, and in 1859 to the State Senate. A brigadier-general of militia, at the outbreak of the Civil War he marched at once to the South with the Eighth Massachusetts Brigade. In February, 1862, he commanded the military forces sent from Boston to the mouth of the Mississippi, and for seven months held military command of New Orleans. His administration here has been violently denounced, and brought down upon him the intense hatred of the Southern people, because, altho he maintained order and enforced sanitary regulations, he compelled the rich secessionists to relieve the wants of those whom their rebellion had impoverished. Relieved of his command he was moved to Virginia and North Carolina, and cooperated with General Grant in his movement upon

Petersburg. In 1866 he was chosen member of Congress from Boston, and two years later was one of the managers in the impeachment of President Johnson. Butler had been a Republican; but as soon as the Greenback and Labor movement began he fell in with it, and in 1878 he was the candidate of this movement for governor of Massachusetts. He received 109,435 votes as against 134,725 for the Republican candidate. In 1879 he was again defeated; but in 1882 was successful as the Democratic nominee. Two years afterward he was the presidential candidate of the Greenback-Labor and Antimonopoly parties, receiving about 133,000 popular and no electoral votes.

Altho very wealthy, General Butler kept near to the heart of the "common people," and few men of his time had as large a following among the working men, especially in Massachusetts. He died in 1893.

C

CABET, ÉTIENNE: French communist; born at Dijon, France, 1788. The son of poor parents, he received little education, but worked his way up till he became a teacher in the *Lycée*. Later he studied both law and medicine. In 1815 he became founder and director of the "Fédération Bourguignonne" for the defense of the national territory, and became connected with the Carbonari, his father before him having been a fiery patriot. About 1820 he went to Paris, and the Revolution of 1830 found him in the first line of its adherents. Up to 1839 he followed the varying fortunes of a Parisian extreme republican, writing various histories of the French revolutions and defending the most extreme acts of the "Mountain." Being tried for this and condemned, he fled to England. Here he read Moore's "Utopia," and devoted henceforth his life to the cause of communism. In 1840 he published his "Voyage en Icarie," an attractive communistic romance. In this he proposed, first, a transitional period of fifty years, and then a complete communism. In the transitional period taxation was to be more and more levied upon the wealthy. Wages favorable to the poor were to be fixt by law. Five hundred million francs were to be spent in providing work and dwellings for the poor. The army was to be disbanded as rapidly as possible, and employed on public works. Under Cabet's full communism all over 65 were to be retired on an allowance. All others able to work were to be set to compulsory work—men from 18 to 65, women from 17 to 50. Everything was to be done to make the work attractive. The family was to be maintained intact, save that at the age of five years children were to be educated in communism by the State. There was to be one official journal; none others were to be allowed. The city of Icaria is described with minute detail.

Great interest was created by the thoughts voiced in Cabet's work, and it was decided to establish an Icaria in America. Cabet bought 1,000,000 acres of land in Texas, and sent, in 1848, sixty-nine trusted followers to prepare the way. Arriving in New Orleans in March, they heard of the revolution in Paris, and debated whether or not to return. They decided to go on; but their ranks were soon decimated by fever, and they returned to New Orleans, where they met Cabet. There was a stormy interview and Cabet was much denounced; but in March, 1849, Cabet, with 280 followers, went to Nauvoo, Ill., where they hoped for a better climate than in Texas. Meanwhile, Cabet had been condemned in Paris to imprisonment on a trumped-up charge of fraud. He returned to Paris, and had the sentence reversed. Returning to Nauvoo, he found the community prospering, having, in 1855, 500 members. There was, however, continual dissension, and Cabet, with 200 followers, left for St. Louis, where he died (1856). The colony, however, survived, and only finally disbanded in the year 1895. (See ICARIA.) Cabet, it should be added, gave a somewhat religious cast to his thought, writing a book, "Le Vrai Christianisme suivant Jésus Christ," and indeed several other books arguing that Christianity is communism.

REFERENCES: *Icaria*, by Albert Shaw; *French and German Socialism*, by R. T. Ely, and other histories of socialism. (See COMMUNISM.)

CADBURY, GEORGE: English manufacturer and philanthropist; born at Edgbaston, Birmingham, 1839; educated under the auspices of the Society of Friends, to which his family belonged. One of the most successful and prosperous cocoa manufacturers in the kingdom, his relations with his employees would seem to be almost ideal. He is chairman of the firm of Cadbury Brothers, Limited, and also of the *Daily News* Publishing Co. His great title to fame rests upon his splendid achievement in the founding of Bourneville, which is known all over the world as "the model village." *Address*: Manor House, Northfield, Worcester, England. (See BOURNEVILLE.)

CAIRNES, JOHN ELLIOT: Political economist; born at Castle Bellingham, County Louth, Ireland, 1823; graduated at Trinity College, Dublin, and called to the bar in 1857, but never seems to have practised. In 1856 he competed successfully for the Whately professorship of political economy in Dublin, and held it for five years, the full period during which it was tenable. During this period he published several essays and lectures, especially one on "The Slave Power," defending the cause of the North in the American Civil War, and winning by it a high reputation for economic thought and analysis. In 1865, he was appointed professor of political economy at University College, London; and when, in 1872, ill health compelled him to resign, he was made professor emeritus. Of the Ricardo-Mill school, Cairnes ranks perhaps second to Mill himself. He maintained sharply that political economy has to do only with what is, not with what ought to be; and his whole treatment was conservative and of the old, orthodox, and *a priori* school, having little to do with the induction of the historical school. While of the school of Mill, he criticized him very sharply on many points, so that the "Dictionary of Political Economy" declares the effect of Cairnes's last and greatest book to have been mainly destructive in shaking faith in the

finality of Mill's conclusions. Cairnes's literary skill and his logical ingenuity are perhaps his most marked characteristics. He was the author of: "Political Essays"; "Leading Principles of Political Economy Newly Expounded"; and "The Slave Power." He died in 1875.

CALVIN, JOHN: French Protestant theologian; born at Noyon, Picardy, France, 1509. His influence on social reform, whether for good or for ill, was far from slight. Prof. John Fiske says of him ("The Beginnings of New England," p. 58): "It is not easy to speak of Calvin with enthusiasm, as it comes natural to speak of the genial, whole-souled, many-sided mirth- and song-loving Luther. Nevertheless, it would be hard to overestimate the debt which mankind owes to Calvin. The spiritual father of Coligny, of William the Silent, and of Cromwell must occupy a foremost rank among the champions of modern democracy. Perhaps not one of the medieval popes was more despotic in temper than Calvin; but it is not the less true that the promulgation of his theology was one of the longest steps that mankind has taken toward personal freedom. Calvinism left the individual man alone in the presence of his God. . . . In the presence of the awful responsibility of life all distinctions of rank and fortune vanished; prince and pauper were alike the helpless creatures of Jehovah, and suppliants for His grace."

It is easy to see from this in what direction Calvin's contribution to human thought and life must lie. By crushing the individual under the sovereign decrees of God, he frees him from all lesser bondage. Calvin's sociology becomes intensely individualistic. He defends private property as morally necessary, as tests of justice and integrity. The communism of the New Testament he tries to prove was not communism. He is the first theologian to defend interest. The State and the Church he regarded as wholly independent, yet alike in Church and State the one supreme ruler is God. Luxury he condemned as sin. He considered it the duty of the Church to provide for the poor, and to this end he revived the temporal duty of the diaconate. He died in 1564.

CAMPANELLA, TOMMASO: Italian monk; born 1568; entered the Dominican Order when quite a boy, but devoted much of his time to the study of philosophy. In 1599 there arose a conspiracy in Calabria against the Spanish rule. Campanella, as an Italian patriot, was charged with conspiracy and heresy, and imprisoned in a dungeon in Naples for nearly twenty-seven years, being repeatedly tortured to make him confess his heresy, but with no avail. During his confinement he wrote several works, one of which was his "Civitas Solis" (published 1623). When released he retired to Rome, and afterward to Paris, where, enjoying the friendship of Richelieu and a pension from the king, he ended his days in peace. The "City of the Sun" is a dialogue between a Knight Templar and a sea captain. The captain tells of a wonderful city he had visited, and describes minutely all that he saw, especially the methods of education and the laws by which the city is governed. It much resembles Plato's "Republic." Work is common to all, but the hours are to be only four, and slavery is repudiated. There is to be community of wives and of goods. Money is not received, even from foreigners. A translation of the "City of the Sun" may be found in Morley's Universal Library. Campanella died in 1639.

CAMPBELL, HELEN STUART: American author; born at Lockport, N. Y., 1839; educated in public schools. Her interest in social problems was first aroused in 1877. She became convinced that the improper preparation of the food of the poor was at least partly responsible for the craving for intoxicating drinks, and in 1878 she went South, organizing the first cooking-schools there, and publishing a book on housekeeping and cookery. Through the reading of her book, "Miss Herndon's Income," published in 1885, the editor of the *New York Tribune* was moved to engage Mrs. Campbell to make a thorough investigation into the conditions of the working women and children of New York City. After a year's work the result was published in "Prisoners of Poverty." She then went abroad to investigate the same conditions in London, Paris, and several Italian cities, resulting in her "Prisoners of Poverty Abroad." Later she received the prize offered by the American Economic Association for the best treatise on "Women Wage Earners." She was one of the organizers and first officers of the Consumers' League of New York, and was associated also with the first clubs established for working girls. Mrs. Campbell is interested in all social questions: the child-labor problem, arts and crafts movements, etc. In addition to the works already mentioned, she is the author of "Household Economics" and many other books. *Address:* 170 West Seventy-sixth Street, New York City.

CANADA: The largest of the British possessions, having an area of 3,653,946 square miles. It includes the provinces of Ontario, Quebec, Nova Scotia, New Brunswick, Manitoba and the Northwest, British Columbia, and Prince Edward Island. Newfoundland is not in the Dominion and to Newfoundland belongs a part of Labrador. The population of the Dominion in 1901 was 5,371,315. Of these, 1,649,371, mainly in Quebec, speak French; 108,112 are Indians. Ontario has a population of 2,182,947 (capital, Toronto, 262,149). Quebec 1,648,898 (capital, Quebec, 68,840. Montreal 267,730), Nova Scotia 459,574 (capital Halifax, 40,832). New Brunswick, 331,120 (capital, Fredericton, 7,000. St. John 40,711). Manitoba, 360,590. British Columbia, 250,000. Prince Edward Island, 103,259; Alberta has 183,000; Saskatchewan, 300,000; Keewatin, 9,800; Yukon, 27,219; Mackenzie, 5,216; Ungava, 5,113. Vital statistics are not collected.

Statistics

A so-called "American invasion of Canada" began in 1898–99. In 1902, out of 67,379 immigrants into Canada 26,388 came from the United States. In 1903 there were 49,473 out of 128,364; in 1904 it was 45,229 out of 130,331, and in 1905 it was 43,652 out of 146,246. It is estimated that they brought with them five to ten million dollars. One hundred and twenty-two U. S. factories have branches in Canada.

Education is advanced. There were in 1905 20,225 schools, 1,114,878 pupils, and expenditures of $12,407,876. There are 18 degree-granting bodies, with 30 colleges. All schools are under government and almost wholly supported

by government grants and local taxation. Education is compulsory, but the law is not very thoroughly enforced. In Ontario, Quebec, and the Northwest territories there are separate schools for Roman Catholics.

There are 1,249 papers (117 dailies).

The most important industries of Canada are agriculture, forestry, fisheries, mining. Out of 63,422,338 acres of occupied land, 30,166,033 are improved. Wheat and oats are the main crops. The forest area is estimated at 1,248,798 square miles. The total value of the fisheries (1904) was $23,500,000. The total value of mineral produce (1905) was $68,574,707; gold, $14,486,833; coal, $17,658,615.

In 1901 the income from manufactures was $569,817,720, or $106.08 per head. Manufactures are carried on extensively and increasingly, employing over 400,000 persons.

Income (1906), $80,139,360. Expenditures, $67,240,641. Public debt, $377,678,580. Canada has a protective tariff with a preferential, adopted 1897, in favor of the United Kingdom and colonies, and more than half her revenue is derived from duties.

Exports (1906), $256,586,630. Imports, $294,267,616. The leading exports and their values in millions of dollars were (1906): wood and manufactures, 34; cheese, 24; gold-bearing quartz, 12; wheat, 33; bacon, 11; cattle, 11; wheat flour, 6. The leading imports were iron, steel, and manufactures of, 41; coal and coke, 21; wool, manufactures of, 15; cotton, manufactures of, 8; sugar, molasses, 9. The imports (1905) from the U. S. were, in millions of dollars, 166: from Great Britain, 73; Germany, 6; France, 7. The exports to Great Britain were 113; the U. S., 77.

Of the railways "Hazell's Annual" (1907) says:

"There were in 1905 65 railway lines working in the Dominion of Canada, with a total mileage of 20,601. The government own about 1,519 miles of railway, and a magnificent system of canals. In 1905 there were 767 miles of electric railways. The principal railway systems are those of the Canadian Pacific, with 8,298 miles; Grand Trunk of Canada, 3,570 miles; Intercolonial, 1,449 miles; Canadian Northern, 1,880 miles. The Grand Trunk Pacific Railway, which was approved by Parliament in 1904, and is being built with government aid, will extend across the Dominion from Moncton, New Brunswick, on the east coast, to a terminus on Kaien Island, at the mouth of the Skeena River, on the Pacific coast. Its total length will be 3,500 miles. The contract between the government and the Grand Trunk Pacific Company is that the company shall construct in eight years the western division of the line, from Winnipeg to the Pacific, the government guaranteeing the principal and interest of three fourths of the bond issue necessary for construction, and paying a cash subsidy for the mountain section, which will eventually amount to between £1,600,000 and £2,000,000. The company guarantees the remaining one fourth of the bond issue, and becomes proprietor of this section. As to the eastern division, from Winnipeg to Moncton, the government will construct it and when complete it is to be leased to the company (who are to have free use of the line for the first seven years) for fifty years, when it reverts to the government, tho the company are then to retain the terminals and such branch lines as they may select. The company will work both sections when they are completed."

In 1905 the receipts of the Canadian railways were $106,467,199, and their working expenses $79,977,574. Their paid-up capital was $1,248,666,414. They carried 25,288,723 passengers and 50,893,957 tons of freight.

Telegraph lines (1905), 37,808, of which 6,590 were government lines. Post-offices, 10,879.

Canada has a network of canals and river and lake navigation making 2,700 miles. In 1905 30,811 vessels passed through the Canadian canals carrying 233,545 passengers and 9,371,744 tons of freight.

Constitution and Government

The crown is represented by a governor-general with a privy council chosen by himself. Each province has a lieutenant-governor appointed by the governor-general in council and a separate Parliament. The Federal Parliament has a Senate nominated for life (from Ontario 24 members, Quebec 24, Nova Scotia 10, New Brunswick, 10, Manitoba 4, British Columbia 3, Prince Edward Island 4, Alberta 4, Saskatchewan 4), and a House of Commons, elected every five years on a low suffrage (from Ontario 86, Quebec 65, Nova Scotia 18, New Brunswick 13, British Columbia 7, Prince Edward Island 4, Manitoba 10, Saskatchewan 5, Alberta 5, Yukon 1). Bills passed by Parliament must receive the assent of the governor-general, and may be disallowed by the king within two years. The governor-general is Earl Grey; premier, Sir Wilfrid Laurier. From 1867 to 1896 the Conservatives were in power except for five years. In 1896, largely on the Manitoba schools question, the Liberals, under the lead of Sir Wilfrid Laurier, won 118 seats to the Conservatives' 86, and the Independents' 8. This lead was increased in 1900. In 1904 Sir Laurier's government won a majority of 52 in a house of 214. The chief issue was the railroad question, the Conservatives favoring steps toward state ownership.

The Canadian militia is under the command of a major-general of the British army. Its peace training strength is 46,000. There is no active marine militia.

Postal savings-banks, under charge of the government, were established in 1868. In 1905 they had 165,518 depositors and $45,368,320 on deposit. The growth of the general banking business shows the prosperity of the Dominion.

Social Reform

Social reform in Canada is not largely advanced, perhaps because the need has not seemed pressing. Land has been easy to get and employment has been good. The wages are not high. Free grants of 160 acres in Manitoba are readily secured.

Nor have such reform movements as have developed had marked characteristics. For the most part they have been connected with the

reform movements of the U. S. Most American trade-unions have branches in Canada as in the U. S., and the statistics of the American Federation of Labor include many Canadian unions. Nevertheless an Annual Trades and Labor Congress of Canada has held twenty-two meetings, and the organization of labor has recently made considerable progress. The recent English labor political successes have had influence in Canada.

As the result of a general Trades Congress held in Victoria, B.C., 1906, an Independent Labor Party has been formed. It is to work after the model of the English party. Although socialistic, it is not called upon to accept the Socialist program at the present juncture. The Socialist delegates mainly voted with the majority on this matter. There is, however, a small Socialist party with some successes in British Columbia. The Socialist vote in 1903 was 8,025. Canada, however, is in the main individualistic. Municipalism and cooperation are little developed, tho the Dominion Government has made some experiments in the direction of State socialism. It has established agricultural experiment stations at various points. Cooperative creameries, under State supervision, are now found all through the Northwest. When a shipping ring threatened to monopolize the cattle trade, the government slipped in and ran cattle steamers of its own.

Nevertheless trusts have much power. The Hudson Bay Company, with stores in almost every town and city, largely controls retail trade. Cooperation, apart from the dairies, consists only in a few bakeries, stores, and credit societies. At Marysville, near Fredericton, New Brunswick, Mr. Alexander Gibson has developed a sort of "Canadian Pullman" for the employees of his saw and cotton mills.

Charity organizations exist in most cities.

Strictly speaking, Canada has no poor law, and no "poor rates," but the relief institutions, though mainly private, are largely supported by municipalities. In the cities large numbers receive outdoor relief, usually with some work test. There are in the Dominion 75 hospitals, 18 asylums for the insane, with many other institutions of various kind, for relief or prevention.

CANALS: Artificial waterways for the purposes of navigation or irrigation. (See Irrigation.) Navigable canals may be divided into those used for inland navigation and those used for shortening sea voyages. With a long and honorable history canals have for the last fifty years been overshadowed in importance by the railway, but are now experiencing a deserved and needed revival.

Canals are of importance, because, first, they can carry certain freight cheaper and better than railroads; secondly, by carrying goods where speed of transport is of small moment, they free the railroads to do more rapid work; thirdly, for certain lines of commerce they can compete with railroads in rates, and so lower railroad rates.

It is evident, therefore, that the railroads should be allowed no longer, through a mistaken policy, to ruin canals, or buy them and control them. Many therefore, not Socialists, hold that government should care for, own and operate canals on some large, comprehensive system. Every argument for the nationalization of railroads applies to canals with added force. (See Railroads.)

History

The oldest large canals known were the royal canal of Babylon, at least 3500 B.C., and some in Egypt, probably 7000 B.C. Important canals were later built at Alexandria and Rome. The Grand Canal of China, 650 miles long, was constructed in the thirteenth century. Canals, were, however, of small use till the invention of locks in Italy in the fourteenth century, after which several important canals were constructed, particularly in Italy and France. Peter the Great began in 1700 the immense system of canals in Russia which connect St. Petersburg and the Caspian Sea and afford continuous navigation, 1,434 miles. The modern era of canal construction dates, however, from the success of the Duke of Bridgewater's Canal, from Worsley to Manchester, commenced in 1759, and lengthened to Liverpool in 1772. A canal mania at this time broke out. Dividends in some of the canal companies amounted to 100 per cent. In Ireland the Grand Canal was built in 1765. Louis I. of Bavaria in 1846 completed a project of Charlemagne in connecting the Main and the Danube by a canal 108 miles long. The Danish Canal, connecting the North Sea and the Baltic, was finished in 1785. The great Gotha Canal in Sweden was completed in 1832. The first canal in America was built at South Hadley, Mass., in 1793. In 1817 the Erie Canal in the United States was commenced, and finished amid great enthusiasm in 1825. The original cost was $5,700,000. In 1852–53, altho the tolls had been reduced to about one third the original amount, the revenue was over $3,000,000 per year.

From 1825–70 interest in canals was wholly eclipsed by that in railroads. In 1870, however, interest in them revived.

In October, 1884, an International Inland Navigation Congress was held in Bremen, and has met nearly every year since. The great Manchester Ship Canal, which enables the largest steamers for India or America to load at Manchester, was commenced in 1885, and opened January 1, 1894, costing $75,000,000. It is mainly controlled by the city, which has a majority of the directors. The North Sea Baltic Canal was commenced in 1887, and finished in July, 1895.

The Erie Canal is by far the most important long canal of the world, tho not the longest, it being, with feeders, 352 miles long. It was long paralyzed by the adverse interests and influences of the New York Central Railroad, but in 1883 all tolls were removed and an active agitation commenced to make it an effective competitor of the railroads. In 1896 a referendum was taken of the state to spend $9,000,000 to deepen it to 9 feet. This was carried, but the amount was insufficient, and in 1903 a referendum was carried authorizing the expenditure of enough to make it a great barge canal, navigable by vessels of 1,000 tons. It has been estimated that this will cost $101,000,000, or $41,000,000 more than the cost to date.

Other great canal systems in the U. S. are the Chesapeake and Ohio, opened in 1850, and 184 miles long, and the Illinois and Michigan, connecting the Great Lakes with the Mississippi. It was opened in 1898, and is 96 miles long. It has been vastly improved by the Chicago Drainage Canal, begun in 1892 and completed 1900. It has also been mooted to make it a great ship canal, allowing ocean steamers to ascend to Chicago from New Orleans. The Morris Canal, 101 miles long (1830), connects the Hudson and the Delaware. The Delaware and Raritan, 43 miles long (1831–34), connects those rivers, and, therefore, New York and Philadelphia. Canada has im-

portant canals besides the Welland Canal. The following table shows

THE GREAT SHIP CANALS OF THE WORLD

Canal	Completed	Length miles	No. of Locks	Cost[1]
Suez	1869	90.	None	$100,000,000
Cronstadt and St. Petersburg	1890	16.	None	10,000,000
Corinth	1893	4.	None	5,000,000
Manchester	1894	35.50	5	75,000,000
Kaiser Wilhelm	1895	61.	.....	40,000,000
Elbe and Trave	1900	41.	.....	25,200,000
Welland	1833	27.	26	6,000,000
Sault Ste. Marie (American)	1855	1.6	1	6,033,533
Sault Ste. Marie (Canadian)	1895	1.125	1	3,770,621

[1] Cost of construction to state.

The Suez Canal is usually considered the most important completed canal, tho more vessels pass the Sault Ste. Marie canals. It is much the longest and without locks. In 1900 there passed through it 3,441 vessels with 13,509,237 tonnage. The net profits in 1899 were 54,153,500 francs.

For the Panama Canal, see PANAMA.

CANTILLON, RICHARD: A writer of Irish race, living in Paris in the first half of the eighteenth century, of whose life little is known, but whose little book, "Essai sur la Nature du Commerce en Général," the earliest edition of which was published in Paris in 1755, seems to have exerted a very profound influence upon the economic thought of his century. For what is known of his life, see article "Cantillon" in Palgrave's "Dictionary of Political Economy." Cantillon's opinions were those of the mercantilist school, modified by the ideas of the Physiocrats, and all stated with unusual scientific precision and method. For a very favorable estimate of his work, see the article by Jevons upon "Richard Cantillon and the Nationality of Political Economy," in the *Contemporary Review*, 1881. (See POLITICAL ECONOMY.)

CAPE COLONY: See SOUTH AFRICA.

CAPITAL may be briefly defined as "that part of wealth which is devoted to obtaining further wealth" (Alfred Marshall, "Economics of Industry," p. 5). Says J. S. Mill ("Political Economy," i., iv., sec. 1): "What capital does for production is to afford the shelter, protection, tools, and materials which the work requires, and to feed and otherwise maintain the laborers during the process. Whatever things are destined for this use, destined to supply productive labor with these various prerequisites, are capital."

Definitions

Knies defines capital as "wealth set aside for the satisfaction, directly or indirectly, of future needs. This satisfaction may be obtained by the individual by lending his wealth at 'usury'—usury of money, usury of victuals, usury of anything that is lent upon usury—or by reserving means for future production, as in the case of the husbandman and his corn or cattle, or by laying up for himself a treasure which will be a delight for many days." President Francis A. Walker ("Political Economy," sec. 73) defines capital as "that part of wealth, excluding unimproved land and natural agents, which is devoted to the production of wealth." E. v. Böhm-Bawerk defines capital as "the complex of goods that originate in a previous process of production, and are destined, not for immediate consumption, but to serve as means of acquiring further goods. Objects of immediate consumption, then, and land (as not produced) stand outside our conception of capital."

There are three questions which are still in dispute in connection with the concept of capital: (1) *Is all capital the result of labor, and ought we to exclude the forces and free gifts of nature?* This question is important when attention is directed from the consideration of the function of capital to that of the function of the capitalist, or owner of capital. The ownership of land and gifts of nature that have merely been appropriated must be defended by somewhat different considerations than the ownership of wealth that has been deliberately produced and saved. For this reason it is probably best with the above authors not to include under the term capital any of the so-called free gifts of nature. Of course it is not always easy to draw the line, as in the case of made land, between the free gifts of nature and the work of man, and yet, altho in some cases the line may be invisible, and therefore hard to place, there is a line and an important line, and usually it can be at least approximated. (2) *Does the distinction between capital and non-capital depend on the intention of the capitalist, or, in other words, the owner of the potential capital?* Thus Professor Marshall, in the "Economics of Industry," argues that a doctor's carriage, when used on professional visits, would be capital, but when used for pleasure merely would not be capital. To this it may be answered that the distinction lies not so much in the intent as in the *use* that actually is made; tho of course usually what is intended for production of wealth is used for that purpose, so that the same article may sometimes be used as capital and sometimes not. The final question is, (3) *Does capital include what are called immaterial, as distinct from material qualities?* This question is somewhat similar to the first. In a general sense immaterial qualities are certainly often, and perhaps usually, the truest capital. Thus we say a man's capital is his health, skill, strength; but in political economy it is more usual and probably wiser not to speak of immaterial capital, because it is different from material capital, and obeys different laws. Capital, therefore, is generally used in political economy in the restricted sense of *material wealth, not the free gift of nature, used for the production of more wealth.*

We now come to consider some different kinds of capital, and first the common distinction made between Circulating and Fixed Capital. In the words of Mill: "Capital which fulfils the whole of its office, in the production in which it is engaged, by a single use is called *Circulating Capital.* "Capital which exists in any durable shape, and the return to which is spread over a period of corresponding duration, is called *Fixed Capital.*"[1] Another convenient distinction is made by Professor Marshall ("Economics of Industry," p. 19) into *Remuneratory Capital* and *Auxiliary Capital.* He says:

Different Kinds of Capital

"*Remuneratory Capital* or *Wage Capital* consists of the food, clothes, shelter, etc., which support labor.

"*Auxiliary Capital* is that which aids labor. It consists of tools, machines, factories, and other buildings that are used for trade purposes, railways, canals, roads, ships, etc.; also raw materials."

Passing now to the theory of capital, we are met at once by the utmost diversity of opinion, and have therefore to consider the history of theories of capital.

[1] "Political Economy," Book I., chap. vi.

The word capital (connected with the Latin *caput*, or head) was originally a mere adjective in the phrase "capital stock," and so used as late as Adam Smith. But it soon came to be used elliptically for the whole phrase, and the single word capital is used in the modern sense at least as early as 1635, in Dafforne's "Merchant's Mirrour." This gives us some clue to the history of the treatment of capital by economists. It has been mainly connected with interest, the phrase "capital stock" being contrasted with the interest accruing from it. In a primitive society there is little capital. Weapons and implements for the hunt and for fishing constitute the total equipment. Later, in the pastoral stage, flocks and herds represent the chief forms of capital, while developing agriculture calls for somewhat more complicated tools and implements. Only after the invention of machinery, however, does capital emerge as an independent factor in production. It is because of the capitalistic system which they ushered in that the inventions which were made in England during the latter half of the eighteenth century may without exaggeration be said to have caused an "industrial revolution." Since Watt perfected the steam-engine in 1776, machine methods of production and the factory system have displaced hand methods and the domestic system in nearly every department of manufacturing industry. With every step in this development the importance of capital has increased until to-day in the Western world the man who is without capital and who is unable to command it is forced almost of necessity to become the hired employee of the man who has capital. The wage system is thus the natural supplement to privately owned capital and is rightly included in the conception of the capitalistic system of production.

History of Theories of Capital

The best history yet written of the various theories of capital is undoubtedly Böhm-Bawerk's "Capital and Interest: A Critical History of Economical Theory," a translation from the German "Kapital und Kapitalzins." This book has been largely used in the following account. The problem of capital Böhm-Bawerk states substantially as follows:

He who owns capital can generally obtain from it a permanent net income called interest. This has notable characteristics. It owes its existence to no personal activity of the capitalist. It flows into him even where he has not moved a finger. It seems in a peculiar sense to spring from capital, or, to use a very old metaphor, to be begotten of it. It may be obtained from any capital, from goods that are barren, as well as those that are fruitful; from perishable goods, as from durable; from goods that can be replaced, and from goods that cannot be replaced; from money, as from commodities. Finally, it flows into the capitalist without ever exhausting the capital from which it comes, and therefore without any necessary limit. It presents the remarkable picture of a lifeless thing producing an everlasting and inexhaustible supply of goods. Whence and why this endless flow of wealth? This is the theoretical problem of capital and interest. This is different, says Böhm-Bawerk, from the social and political problem. The theoretical problem asks why there *is* interest on capital; the social and political problem asks whether there *should* be. Yet it is doubtful if we can keep the two questions apart. "Whether there should be" certainly depends upon "why there is," and "why there is" is not unaffected by "whether there should be." Yet they are two questions, and for the sake of clear thought we should try to keep them separate, and to answer the first question first. Yet, historically, in political economy, the second question received the first treatment. Ancient political economy evidenced a deep disapproval of interest, as witnessed in the prohibition of interest between Jews in the Mosaic code and in many passages from classic literature. (See USURY.) The reason is not far to seek. Credit had little place in production. Machinery was simple. Almost all loans were for immediate consumption, and, as a rule, to people in distress. The creditor was usually rich, the debtor poor, and the former, therefore, in the light of a man squeezing something from the poor man. Yet was there little study of the question. Plato, Aristotle, the two Catos, Cicero, Seneca, Plautus —all condemn interest, and yet assign little reason for so doing. Aristotle's argument was: Money is by nature incapable of bearing fruit. The lender's gain, therefore, must come from a defrauding of the borrower. The strong condemnation of interest by the Mosaic law and the early Christian Church is well known. Yet there was usually but little reason given, and some of the reasons that were given are far more rhetorical than logical. Gradually Greek and then Roman legislation came to allow interest, and so the practise spread. The Middle Ages, however, witnessed a revival of the condemnation of interest. The Church strenuously condemned it (see CANON LAW), first categorically, and then, as the desire for interest and the seeming need of interest increased, with more show of argument and attempt at reason. Gonzalez Tellez falls back on Aristotle's argument. Thomas Aquinas (*q. v.*) does the same in a different form. He argues that he who loans money passes over money and all that comes from it, and therefore has no right to the interest that springs from it. Interest again he considers as the hypocritical and underhand price asked for a good common to all—time. Time is simply a pretext used by usurers to get more than they give. But time is a common good, given to all equally by God. This was the general position of the canonists, tho steadily and quietly exceptions and excuses were introduced permitting interest under this pretext or that.

The Problem of Capital

Ancient Theories

Medieval Theories

The Protestant reformers usually approved of interest, altho with more or less reserve; at least this is so with Zwingli, Luther (in his later days), Melanchthon, and Calvin. The last named, however, is the only one who gives careful reason for his approval. His argument is that interest is legitimate, because, tho money itself be barren, money is used as a house is used, for gain of convenience or rent, and therefore that the lender of the money is entitled to interest as his share of the gain. Molinæus, taking somewhat the same ground, opposed the canon prohibition of interest. Besold and Grotius followed hesitatingly in the same line till Salmasius (about 1640) poured out a flood of writing defending interest, and was followed by Bacon, North, Locke, Steuart, Hume, Galiani, Vasco, Beccaria, Mirabeau, and Bentham.

Protestant Views

But this already brings us to modern times, when capital and interest, having become matters of such vast moment, have elicited far more careful and scientific study. Turgot comes first. He defends interest on the ground that capital is always the equivalent of rent-bearing land, and therefore should receive interest as land brings forth fruit. This theory Böhm-Bawerk calls the "Fructification" theory, and condemns because, in his opinion, it explains nothing. Adam Smith has no definite position, but throws out various hints about the origin of interest, some of which are contradictory. Adam Smith's neutral position could not be long held. The question of labor and capital became the burning question of the nineteenth century. Five answers have been developed through the century, and more or less side by side; so that we shall do best not to attempt to follow chronological order, but to see the separate schools as markedly and distinctly as possible.

The Fructification Theory

First, Böhm-Bawerk puts what he calls the "colorless" answer, which, like Adam Smith's, is a confused answer, altho made by Ricardo, Torrens, McCulloch, and several continental writers. Ricardo, for example, tho he sharply and at length gives his conception of the law that governs *the rate* of return to capital, scarcely gives any *reason* for the return, save that, if capitalists did not receive any interest, they would not invest.

Ricardo

We come, next, to what Böhm-Bawerk calls the "*Productive*" theory, that capital actually produces wealth, and that therefore the capitalist who gets his interest simply gets what his capital produces. This theory is subdivided into four theories: (1) That capital serves toward the production of goods; (2) that it serves toward the production of more goods than could be produced without it; (3) that it serves toward the production of more value than could be produced without it; (4) that it serves toward the producing of more value than it has in itself. The first two of these theories Böhm-Bawerk calls the "Naive Productive" theories; the third he calls the "Indirect Productive" theory, and from the last theory spring such important theories that he considers them by themselves as "Use" theories.

The Productive Theory

Among the "Naive Productive" theories we have those of J. B. Say, who first broached this theory in 1803, brilliantly but not clearly, and more recently of Roscher, Leroy-Beaulieu, Scioloja, and others. Böhm-Bawerk's answer to this theory is simply that it has not been proved that capital in itself produces goods. Capital undoubtedly, as Roscher argues, enables labor to produce *more* goods; but the amount of return to capital has by no means been proved to be equal to the amount of value of the increased amount of goods it enables labor to produce.

The "Indirect Productive" theory, that capital produces more *value*, was first taught by Lord Lauderdale in 1804, and then by his greater follower, tho not disciple, Malthus. Malthus carefully defines profit as "the difference between the value of the advances necessary to produce a commodity, and the value of the commodity when produced" ("Principles of Political Economy," 2d ed., p. 262); but he does not equally carefully show why there should be this difference of value, tho he does in general point to capital as the producer of more value. Henry Carey and Peshine Smith in America and the painstaking Thünen and Strassburger in Germany Böhm-Bawerk assigns to this school.

We come now to the "Use" theories, which, tho an offshoot of the "Productive" theories, quickly grew into an independent life of their own. This theory is that capital, apart from its substance value, has a use value, and that the capitalist who draws interest is thus rewarded for sacrificing the use of capital during the period of production. J. B. Say first suggested this, together with his "Naive Productive" theory, Hermann worked it out, and Menger gave it its best form. It is largely a German theory, Nebenius,

Use Theories

Marlo, Bernhardi, Mangoldt, Schäffle, Kneis, besides Hermann and Menger, all following it in one form or another. Böhm-Bawerk, however, rightly maintains that there is no independent "use" of capital aside from capital, and that therefore this non-existent "use" cannot be the cause of interest; but even if it does exist, as apart from the substance of capital, it simply adds to the problem by raising two problems in place of one. What is this independent use of capital?

Abstinence Theory

Next in order is the famous "Abstinence" theory, made prominent in the lectures of N. W. Senior at Oxford University, and later in his "Outlines of the Science of Political Economy" (1836). Adam Smith and Ricardo declared labor to be the source of value. Senior amended this by saying that value is due to scarcity (utility being assumed), and that labor *and abstinence* account for scarcity. Hints of this had appeared before in Ricardo and in Adam Smith's opposition of "future profit" to "present enjoyment," but Senior first worked it into a careful and logical system. According to this, capital is the result of labor, but of labor applied not to immediate results, but to far-off results; and, therefore, since its owner has sacrificed immediate results to distant ones, he is indemnified by interest. He is able to secure this indemnification because the exchange value of goods depends, according to Senior, partly on the usefulness of the goods, partly on the limitation of their supply; and the limitation depends upon the number of those willing to abstain from immediate consumption of wealth to devote it to capital. The "maximum of price" is the sacrifice with which the buyer could himself produce or procure the goods; and the "minimum of price" is the cost of production. Under competition these approximate. But the cost of production consists of the sum of labor and abstinence requisite for the production of the goods. If abstinence is always requisite for production, it can always command its money return.

The trouble with this theory is that it makes too sweeping a generalization from an idea containing an element of truth. Like the other theories it mistakes a part of the truth for the whole explanation. The theory is now generally discarded (see ABSTINENCE, REWARD OF), yet it has had many followers, and some of them most distinguished, such as J. S. Mill, Jevons, Cairnes, Roscher, Schüz, Max Wirth, Rossi, Molinari, and Garnier. Bastiat accepted the doctrine under a developed form. Bastiat's great social law is "service for service." He argues that he who provides capital not only sacrifices present enjoyment, but does positive service by allowing the laborer to have now what otherwise he could only obtain later by great sacrifice of his own tools. But this only confuses. He who sacrifices in order to prevent sacrifice certainly does so, but this is only one sacrifice, and cannot receive return for two.

We pass then to the next group, which Böhm-Bawerk calls "Labor" theories, because under various forms they try to prove that interest is payment to the capitalist for labor performed. The main advocates of this are James Mill, McCulloch, Courcelle-Seneuil, Rodbertus, Schäffle. Under one rorm or another they all argue that capital is stored-up labor, and that interest and profit are simply the price paid for stored-up labor. But how, then, does it happen that the capitalist eventually gets back all his capital; that is, all his stored-up labor, and yet gets interest too? Courcelle-Seneuil argues that interest is payment for the labor of storing up capital. This is artificial. Its falsity may be seen in the fact that interest has no connection with this, being often greatest where this so-called labor is least, and vice versa.

We come then to what may be called the Socialist, or the "Exploitation" theory. According to this, all goods that have value are the product of human labor, and indeed, economically considered, are exclusively the product of human labor. The laborers, however, do not retain the whole product of their labor, because capitalists, taking advantage of their command over the indispensable means of production, as secured to them by the institution of private property, secure to themselves a part of the laborer's product. The means of doing so are supplied by the wage contract, in which the laborers are compelled by hunger to sell their labor-power to the capitalist for a part of what they, the laborers, produce. Interest is thus a portion of the product of other people's labor, obtained by exploiting the necessitous condition of the laborer.

Exploitation Theory

The way had been prepared for this by Adam Smith and Ricardo, in teaching that labor is the source of value; tho Ricardo abandoned this doctrine before his death. Hodgskin in England and Sismondi in France were the first to really state the theory, and they only in a mild and general way; but it was soon taken up with strength and in earnest by Proudhon in France and Rodbertus in Germany, and then by the great Socialist leaders, Lasalle and Marx. Of the Socialists, Rodbertus and Marx have worked out the theory most carefully. Rodbertus is considered by most political economists the most careful, altho Marx has worked out the theory the most brilliantly and the most popularly. Rodbertus accepts almost as axiomatic the premise that labor, economically speaking, is the source of all value. Rent he defines as "all income obtained without personal exertion, solely in virtue of possession" ("Soziale Frage," p. 146). It includes two kinds of rent—land rent and profit on capital. Rent owes its existence to two facts: economically, that, with machinery and division of labor, laborers can produce more than they require to support life; and legally, that private property in land and capital enables their owners to employ laborers who, not having land and capital, and needing them for production, are unable to work except in service for these capitalists, and are driven by hunger often to give to the capitalists all they produce except what is barely necessary to support life. The form which this compulsion originally took was slavery, the origin of which was contemporaneous with that of agriculture and landed property. To-day contract has taken the place of slavery; but since capitalists own substantially all the land and capital, they have the laborer as equally at a disadvantage as under slavery, and can take from him under contract as much as before under slavery. Thus, says Rodbertus, "The contract is only formally and not actually free, and hunger makes a good substitute for the whip. What was formerly called food is now called wage" ("Soziale Frage," p. 33).

Thus all rent is an exploitation, or, as he says in effect, a robbery of the product of other people's labor ("Soziale Frage," p. 150). The amount of rent increases with the productivity of labor; for under the system of free competition the laborer can receive little more than his maintenance, no matter how much he produces. The division between rent of land and rent of capital Rodbertus believes depends upon how much labor value is represented in land and in capital, since labor is the measure and source of all value, even rent being the product of labor, tho conditioned by the possession of wealth. Nevertheless, except in a posthumous tract on "Capital," Rodbertus does not favor the abolition of private property in either land or capital. He ascribes to it an educating power, a "kind of patriarchal power that could only be replaced after a completely altered system of national instruction, for which at present we have not got even the conditions" ("Erklärung," p. 303).

Karl Marx

Marx's theory is the same, tho worked out in a different way. The utility of a thing, he argues, is its *value in use*. But this value is not something in the air. It is limited by the properties of the commodity, and has no existence apart from that commodity. The commodity itself is the use value. Now use values exchange. They are measured. To be measured they must have some characteristic in common. What is this? It is not in their *qualities*; their qualities are very different. Things that exchange must have the same *quantity* of exchange value. What is the thing that they have the same quantity of? If we discard their qualities as use value, they have only one common property left, that of being products of labor. This must be the measure of their exchange value. So the value of all goods is measured by the quantity of labor contained in them or in labor time. But labor is of different value in different individuals; therefore, we must take the "socially necessary labor time"—i. e., the labor time required to produce a use value under the conditions of production that are socially normal at the time, and with the socially necessary degree of skill and intensity of labor. Now the problem of capital and of interest and profit is this: One man sells the commodity which he possesses for money, in order to buy with the money another commodity which he requires. This course of circulation may be exprest by the formula: Commodity, money, commodity. But there is another course of circulation. Men buy commodities in order to sell, or—money, commodity, money. But in this circuit, men buy commodities in order to sell at an advance. The real circuit is M., C., M'. (M' representing the sum advanced plus an increment). This is the characteristic circuit of capitalistic industry. It applies seemingly only to the merchant's capital, but it is true of all industrial capital. The manufacturer, every one in commerce, even the farmer, buys something—invests, that is—in order to sell what he buys, or what springs from what he buys, at an advance. Whence the advance? This is the problem. He buys material at its market value; he sells the material at the market value; how is he enabled to sell at a higher price than he buys? Whence this surplus value? This is the problem of Marx's book—his famous "Capital." The surplus value cannot originate in anything outside the circuit, for nothing pours economic value into his hands. It cannot originate in the circuit itself, for he cannot continually buy commodities under their value, nor continually sell above their value. Whence his profits? He can only sell for more than he buys by adding labor to it. Labor is thus the only source of *surplus value*. But if he put labor into it, either his own or hired, he pays for that. How does the capitalist sell for more than he puts in? He must buy material and labor at their value, sell the result at its value, and yet draw out more than he puts in. How? Marx answers this by saying that there is one use value which possesses the peculiar property of being the source of exchange value; this is labor or labor-power. It, labor-power, is offered for sale on the market on the double condition that the laborer is personally free—for otherwise he would be a slave, not a seller of labor-power; and that, secondly, he is deprived of all means of independently using his labor-power, otherwise he would work for himself. The present condition of society furnishes these conditions. The capitalist makes use of this. The value of the commodity labor-power, like that of all other commodities, is regulated by the labor time necessary for its reproduction;

in this case, by the labor time necessary to produce the maintenance of the laborer. The capitalist gets the laborer to work for him. He gives him his labor-time value—that is, maintenance, the value necessary to maintain and reproduce him. But the laborer gives the capitalist more labor time than this. If in six hours the laborer produces enough to maintain him, and works ten hours, in the four hours he produces for the capitalist this "surplus value." Surplus value, therefore, according to Marx, results from the capitalist getting the laborer to work a part of the day for him without paying for it. In the laborer's day, thus, we have "necessary labor time" and "surplus labor time," the source of "surplus labor value." Capital is not thus a command over labor, but a command over *unpaid* labor. All surplus value, in whatever form it be disguised, as profit, interest, rent, or any other, is only the material shape of unpaid labor. Bitterly, upon this foundation, does Marx trace the history and expedients of capital to lengthen the time and intensity of the working-day in order to get more surplus value.

The answer to this theory, which will be seen to be, in another form, the same as Rodbertus's, may be very varied. It is perhaps sufficient, however, to say that it has not been proved that labor is the source of value. Exchange is not based simply upon labor-time value. Use value does affect exchange. A good natural voice, uncultivated by any labor, has exchange value. Unimproved natural commodities have exchange value. Scarcity affects exchange value. The whole theory that labor is the source of value is untenable. Rodbertus does not attempt to prove it. Marx appeals not to facts, but to the above dialectics, which can be shown to be faulty. Marx says use values in exchange are disregarded. This is not the case; but if it were, his conclusion does not follow that their being the product of labor is the only characteristic left which can be the basis of exchange. Many other elements enter in—scarcity, demand, appropriation of them, etc. Marx's analysis contains truth, but by no means the whole truth, and its fundamental proposition is not true.

The last theory of capital and interest that merits consideration is that of Böhm-Bawerk himself as expounded in his second volume, "The Positive Theory of Capital." According to this view, the key to the interest problem is found in the time element involved in capitalistic production. Men normally undervalue future goods in comparing them with present goods. Thus as future goods ripen into present goods their value is enhanced in accordance with a psychological law. Interest is simply this addition to the value of goods that results from advancing them nearer the period when they are to satisfy wants. As men normally discount future goods so they are always willing to pay a premium in future goods for command over present goods. The current rate of interest is thus determined by the comparative valuations which men collectively place upon present and future goods. When the rate on safe investments is 4 per cent, for example, this means that in the estimation of the marginal men who take part in capitalistic production $100 in hand, with the immediate command over want-satisfying goods which it gives, is equivalent to $104 a year hence. This theory is explained and defended with great dialectical skill, but it cannot be said to have commanded the assent of many economists as an adequate solution of the interest problem.

The fact seems to be that no one theory is complete; that almost every theory yet advanced has had its element of truth and made its contribution to science. It is *man* who pays, and *man* who asks interest for capital. Men are not simple "economic men." The reasons that move the will to demand and pay interest are not simple, but numerous, intricate, and varying at different times. In the Fructuation theory, the Productivity theory, the Use theory, the Abstinence theory, the Exploitation theory, the Time theory, there is truth, but the whole truth lies only in the correct synthesis of all theories. It should be added, however, that whatever be the theory as to the origin of capital and interest, neither the believers nor the disbelievers in interest question the fact of the contribution, and the necessary contribution, that capital makes to production. Socialists, no less than the most conservative economists, admit the necessity of capital to production. Socialists simply assert that work (personal effort of head or hand) should be required from every member of society (save from the young, aged, or infirm), and that there should be no class of society whose economic function is simply to furnish capital and live on the interest. They declare that all *capital* should be owned and furnished by the community, and that all individuals should furnish work and receive therefor, their rightful share in the product. (See Socialism.) Those Socialists who do not hold with Adam Smith and Marx that labor is the only source of value, do not hold either that capital comes wholly from unpaid labor; they perceive that capital may come from the personal labor of one's ancestors, or from personal saving, or by speculation or investment—in a hundred ways, some of them moral, some immoral; but they hold that the unity of society is the key to the freedom of the individual, and that that freedom demands that, however gained, capital be held and operated collectively for the equitable good of all, each man and woman being in some way a worker for the general good. This holding of capital is, in their opinion, a step not based on any theory, but called for by the conditions of human life, in the process of evolution, developing a higher organism out of lower organisms. Those Socialists who look to divine sanctions for their acts argue that capital should be held in common and each work for the good of all, as in a family property is held in common and each works for each. Interest on capital they say is "natural," because capital performs a natural function, and can therefore obtain a portion of the product, as conditional to its being forthcoming; and when capital is monopolized by a portion of the community, it can, subject to competition between capitalists, dictate its own terms, because he who has it not is dependent upon him who has. What such Socialists assert is that, tho interest is natural, it is socially indefensible, since God has made all men one, and given to all the duty of labor; that therefore for one portion of society to furnish the capital and be able to live without labor, while another portion of society can scarcely live by the hardest toil, is a plain violation of the law of God. Such are the various theories as to capital that have prevailed at various times and are held to-day by various schools of thought.

The Socialist Contention

The Christian Socialist View

Turning to the laws that govern the growth of capital, we present two representative treatments of the subject, and first, one by Professor and Mrs. Marshall. In chap. vi. of their "Economics of Industry," they say:

"The growth of capital depends upon the *power* and the *will* to save.

"The power of saving depends on the amount of wealth out of which saving can be made. Some countries, which have a large population and produce a great amount of wealth, have very little power of saving. The whole continent of Asia, for instance, has less power of saving than England has. The total produce indeed of its industry is larger than that of England; but the number of people among whom this is divided is so great that they are compelled to consume almost the whole of it in supporting life.

The Growth of Capital, Orthodox View

"As Mill says, 'the fund from which saving can be made is the surplus of the produce of labor after supplying the necessaries of life to all concerned in the production (including those employed in replacing the materials and keeping the fixed capital in repair); more than this surplus cannot be saved under any circumstances; as much as this, though it never is saved, always might be. This surplus is the fund from which the enjoyments as distinguished from the necessaries of the producers are provided, it is the fund from which all are subsisted who are not themselves engaged in production; and from which all additions are made to capital. It is the real net produce of the country.'

"Since the requisites of production are land, labor, and capital, the conditions on which the total produce of industry depends may therefore be classed as, first, fertility of the soil, richness of mines, abundance of watercourses, and an invigorating climate; secondly, the number and the average efficiency of the working population; this efficiency depending on moral as well as mental and physical qualities; thirdly, the abundance of the means which the industry of the past has accumulated and saved to help the industry of the present; that is, the abundance of roads and railroads, of canals and docks, of factories and warehouses, of engines and machines, of raw material, of food and of clothing; in short, the already accumulated capital of the nation. . . .

"Next as to the will to save.

"The strength of the desire of accumulation depends on moral and social conditions which vary widely in different times and countries.

"(*a*) The intellect. The inclination to save arises from the hope of obtaining some future advantage, and this future advantage, if it is to afford motive for action, must be realized. . . .

"(*b*) Affection for others is one of the chief motives if not the chief motive for the accumulation of capital. . . .

"(*c*) The hope of rising in the world. . . .

"(*d*) The opportunity to gain great social advantages by the possession of wealth. . . .

"(*e*) Political and commercial security. . . ."

Lastly, Mr. and Mrs. Marshall inquire how far the accumulation of capital depends upon the rate of profits, and the rate of interest which the owner of capital can obtain by lending it to others, and they answer:

"A high rate of interest no doubt affords a liberal reward of abstinence, and stimulates the saving of all who are ambitious of earning social position by their wealth.

"But the history of the past and the observation of the present show that it is a man's temperament, much more than the rate of interest to be got for his savings, which determines whether he makes provision for his old age and for his family or not. Most of those who make such a provision would do so equally whether the rate of interest were low or high. And when a man has once determined to provide a certain annual

income, he will find that he has to save more if the rate of interest is low than if it is high.

"Again, a high rate of interest is a great inducement to retire early from business, and live on the interest of what has already been accumulated. Sir Josiah Child indeed said two centuries ago, 'We see that generally all merchants in countries in which the rate of interest is high, when they have gotten great wealth, leave trading' and lend out their money at interest, 'the gain thereof being so easy, certain, and great; whereas in other countries, where interest is at a lower rate, they continue merchants from generation to generation, and enrich themselves and the State.' It is more true now than it was then, that many men retire from business when they are yet almost in the prime of life, and when their knowledge of men and things might enable them to conduct their business more efficiently than ever. Thus a fall in the rate of interest would in some ways promote the production and the accumulation of wealth.

"But it would diminish the *power* of saving from a given amount of capital, because the larger the income a man derives from his business, the larger are the means he has of saving."

Such is an admirable example of the treatment of the subject from the standpoint of the most progressive orthodox economics. As an example of the treatment of the subject from the socialist standpoint, we give a quotation from the lecture on "The Industrial Basis of Socialism," by William Clarke, and included in the "Fabian Essays." Says Mr. Clarke:

Growth of Capital, Socialist View

"The capitalist was originally an *entrepreneur*, a manager who worked hard at his business, and who received what economists have called the 'wages of superintendence.' So long as the capitalist occupied that position he might be restrained and controlled in various ways, but he could not be got rid of. His 'wages of superintendence' were certainly often exorbitant, but he performed real functions; and society, as yet unprepared to take those functions upon itself, could not afford to discharge him. Yet, like the king, he had to be restrained by the legislation already referred to, for his power involved much suffering to his fellows. But now the capitalist is fast becoming absolutely useless. Finding it easier and more rational to combine with others of his class in a large undertaking, he has now abdicated his position of overseer, has put in a salaried manager to perform his work for him, and has become a mere rent or interest receiver. The rent or interest he receives is paid for the use of a monopoly which not he, but a whole multitude of people, created by their joint efforts.

"It was inevitable that this differentiation of manager and capitalist should arise. It is part of the process of capitalist evolution due to machine industry. As competition led to waste in production, so it led to the cutting of profits among capitalists. To prevent this, the massing of capital was necessary, by which the large capitalist could undersell his small rivals by offering, at prices below anything they could afford to sell at, goods produced by machinery and distributed by a plexus of agencies initially too costly for any individual competitor to purchase or set on foot. Now for such massive capitals, the contributions of several capitalists are needed; and hence has arisen the joint-stock company or *Campagnie Anonyme*. Through this new capitalist agency a person in England can hold stock in an enterprise at the Antipodes, which he has never visited and never intends to visit, and which, therefore, he cannot 'superintend' in any way. He and the other shareholders put in a manager, with injunctions to be economical. The manager's business is to earn for his employers the largest dividends possible; if he does not do so, he is dismissed. The old personal relation between the workers and the employer is gone; instead thereof remains merely the cash nexus. To secure high dividends, the manager will lower wages. If that is resisted there will probably be either a strike or lockout. Cheap labor will be, perhaps, imported by the manager; and if the work-people resist by intimidation or organized boycotting, the forces of the State (which they help to maintain) will be used against them. In the majority of cases they must submit. Such is a not unfair picture of the relation of capitalist to workman to-day, the former having become an idle dividend-receiver. The dictum of orthodox political economy, uttered by so competent an authority as the late Professor Cairnes, runs:

"'It is important, on moral no less than on economic grounds, to insist upon this, that no public benefit of any kind arises from the existence of an idle rich class. The wealth accumulated by their ancestors and others on their behalf, where it is employed as capital, no doubt helps to sustain industry; but what they consume in luxury and idleness is not capital, and helps to sustain nothing but their own unprofitable lives. By all means they must have their rents and interest, as it is written in the bond; but let them take their proper place as drones in the hive, gorging at a feast to which they have contributed nothing.' . . .

"That joint-stock capitalism is extending rapidly every one knows. In the United States, according to Mr. Bryce, the wealth of joint-stock corporations is estimated at one fourth of the total value of all property. In England every kind of business, from breweries, banks, and cotton-mills down to automatic sweetmeat machines, is falling into the hands of the joint-stock capitalist, and must continue to do so. Twenty years ago who would have supposed that a brewery like that of Guinness, or such a banking firm as Glyn, Mills & Co., would become a joint-stock company? Yet we know it is so to-day. Capitalism is becoming impersonal and cosmopolitan. And the combinations controlling production become larger and fewer. Barings are getting hold of the South African diamond fields. A few companies control the whole anthracite coal produce of Pennsylvania. Each one of us is quite 'free' to 'compete' with these gigantic combinations, as the principality of Monaco is 'free' to go to war with France should the latter threaten her interests. The mere forms of freedom remain, but monopoly renders them nugatory. The modern State, having parted with the raw material of the globe, cannot secure freedom of competition to its citizens; and yet it was on the basis of free competition that capitalism rose. Thus we see that capitalism has canceled its original principle—is itself negating its own existence."

Prof. John B. Clark, in his "Distribution of Wealth" and other works, has ably treated the part played by capital in production.

Concerning statistics as to the large part played by capital in the modern world, see WEALTH; TRUSTS; MACHINERY; FINANCE. Exact statistics in regard to the value of the capital of different countries as distinguished from their wealth in general are not available, and even statistics of wealth must be accepted with a good deal of caution. The figures which follow are the most trustworthy that are available for the United Kingdom and the U. S.

According to the elaborate calculations of Sir Robert Giffen, the total wealth of the United Kingdom increased from £4,000,000,000 in 1845 to £6,000,000,000 in 1865; £8,500,000,000 in 1875, and £10,000,000,000 in 1885. Compared with the population this indicates an increase in average per capita wealth during the whole period of forty years from £143 to £270. How much of this wealth was capital in the restricted sense of our definition it is impossible to say with exactness. Thus, of the estimated wealth in 1885 of £10,000,000,000 some £1,700,000,000 is credited to land and £1,900,000,000 to houses, but there is no way of determining what part of the value of land was a gift of nature and what part the result of investments of capital in improvements, or what proportion of the houses served as workshops and thus contributed to the further production of wealth. The amount of income derived by inhabitants of the United Kingdom from land and capital, that is, from investments of all kinds, may be estimated from the annual income tax returns. Thus for the year 1902, the income from the ownership of lands and houses was returned at £238,000,000, the income from government securities at £44,000,000, and from business enterprises, except farming, at £488,000,000. Estimating that at least one third of the latter income was in the form of interest and dividends to investors having no active part in the businesses concerned and allowing for false returns, it appears probable that the total income from investments was not less than £500,000,000, or about £12 per capita.

The total wealth of the U. S. for the years 1900 and 1904, as estimated by the Census Bureau, was $88,517,000,000 in the former year, and $107,104,000,000 in the latter. Comparing the total estimated wealth in 1900 with the population as determined by the census in that year gives $1,150 as the average per capita wealth. The principal items in the total for 1904 were as follows: Real property and improvements, $62,000,000,000; live stock, $4,074,000,000; farm implements and machinery, $845,000,000; manufacturing machinery, tools, and implements, $3,298,000,000; gold and silver coin and bullion, $1,999,000,000; railroads and their equipment, $11,245,000,000; street railways, shipping, waterworks, etc., $4,841,000,000; all other, $18,462,000,000. From the form in which these estimates are given it is impossible even to make an intelligent guess as to what part of them represents capital in the narrow sense. There are no statistics for the U. S. comparable with the income tax returns for the United Kingdom.

For a discussion of whether the profits or capital are falling, see PROFITS, WEALTH.

CAREY, HENRY CHARLES: American economist, born in Philadelphia, Pa., 1793; the son of Matthew Carey, an Irish refugee and publisher who had written on economic themes. The son succeeded the father, but retired with a competency in 1835, and devoted his life to economics. Thirteen octavo volumes and 3,000 pages of tracts, besides newspaper articles, perhaps twice as voluminous, attest his industry, while the fact that many of his writings have been translated into seven different languages speaks for his ability and originality of thought. Says Palgrave's "Dictionary of Political Economy":

> Carey began his scientific career at a juncture when the English school appeared to have exhausted its deductions from assumed premises, and to shrink from adjusting its conclusions to the conditions of actual life. His treatment of social science was original, and led him to a series of supposed discoveries, the order of which he has stated in the introduction to his most important work, "The Principles of Social Science." His point of departure was a theory of value which he defined as the "measure of the resistance to be overcome in obtaining things required for use, or the measure of nature's power over man"—in simpler terms, the cost of reproduction. This theory Carey applied to every case of value—to commodities, services, and land, and in some passages seemingly to man himself. Reasoning that every gift of nature is gratuitous, he found a universal tendency to a decline of value as the arts advance, and to a decrease in the value of accumulated capital, as compared with the results of present labor, with a resulting harmony of interests between capitalist and laborer. This theory Carey enunciated in his "Principles of Political Economy," published in 1837–40, and its appearance in slightly modified terms in Bastiat's "Harmonies Economiques," in 1850, led to a sharp discussion between the two authors in the *Journal des Economistes* for 1851.

Ten years later, in his "Past, Present, and Future," Carey expounded his notorious land theory, which was the exact reverse of the Ricardian; but tho argued by Carey with great vigor and at great length, and eliciting much interest because of its novelty, it has been accepted by scarcely any other careful economist. It laid down the principle that men first till the poorer and more easily worked lands, and then descend upon richer lands as capital increases, so that with the advance of civilization the rate of returns from land rises instead of falls. He deduced from this a rejection of the Malthusian doctrine, since rising returns from land could support more and more men.

Carey's cardinal principle, however, is found in the second chapter of his "Social Science," where he states, "the great law of molecular gravitation as the indispensable condition of the being known as man." This law of being he declares to be the same in matter, man, and communities. As, in the solar world, attraction and motion are in the ratio of mass and proximity, so in the social world, association, individuality, responsibility, development, and progress are proportionate to each other. This theory, not of analogy, but of absolute identity of law, Carey maintained with great vigor in the "Unity of Law," published in his seventy-ninth year. This theory led Carey first to adopt and advocate those theories of free trade for which he is perhaps the best known in the United States; tho afterward, from the same principles, to retreat from this position. The central point of his social philosophy being association, as the primary condition of progress, in the commerce of exchange of commodities and of ideas between countries, Carey thought he saw the opportunity for closer association, economic efficiency, and general efficiency, and hence argued strongly and determinedly for free trade, giving a strong impulse to the arguments now becoming common in this country. It was only later that he abandoned this belief, from a conviction that in the present state of the world the coordinating power of the government must be used in order to preserve economic harmony and to arrive at ultimate freedom. So great was his ability and so distinctive his views, that his school of thought is sometimes called theAmerican School of Political Economy.

Carey's main works are: "Essay on the Rate of Wages" (1835); "Harmony of Nature" (privately printed, 1836); "Principles of Political Economy" (3 vols., 1837, 1838, 1840); "The Past, the Present, and the Future" (1848); "Harmony of Interests, Agricultural, Manufacturing, and Commercial" (1850); "Slave Trade, Domestic and Foreign" (1853); "Principles of Social Science" (3 vols., 1858–59); "Manual of Social Science" (edited by Miss McKean, 1864); "The Unity of Law, as Exhibited in the Relations of Physical, Social, Mental, and Moral Science" (1872). He died in 1879.

CARLYLE, THOMAS: Scottish writer; born at Ecclefechan, Dumfries County, Scotland, 1795. In the present article he is considered simply from the standpoint of social reform; yet this element forms no small portion of his life, and his contribution to social reform gave no slight impulse in the advance of the century. From the standpoint of the social movement, the nineteenth century must be divided into two nearly equal, yet very diverse, parts. The first fifty years were, socially considered, negative, destructive, characterized by the freeing of the individual. Its outcomes were democracy, free trade, competition, individualism. The last fifty years of the century were, socially considered, positive, constructive (or at least seeking construction), characterized by the collective thought supplanting individualism and developing in its place the social organism. Its outcomes were unity, cooperation, monopoly, centralization, socialism. Carlyle belongs to the first half of the century, yet with no little trace of transition to the second. Living till 1881, his genius was matured, and his greatest works were written before 1850. He was an individualist, and his writings are full of undeveloped socialism. In more than his denunciation of wrong he was a John the Baptist, the last of the old prophets, and a forerunner of the new. Mazzini's magnificent essay on Carlyle pronounces a just criticism. He says:

> Mr. Carlyle comprehends only the *individual*; the true sense of the unity of the human race escapes him. He sympathizes with all men, but it is with the separate life of each, and not with their collective life. . . .
>
> The nationality of Italy, in his eyes, is the glory of having produced Dante and Christopher Columbus; the nationality of Germany, that of having given birth to Luther, to Goethe, and to others. The shadows thrown by these gigantic men appear to eclipse from his view every trace of the national thought, of which these men were only the interpreters or prophets, and of the people, who alone are its depository. All generalization is so repugnant to Mr. Carlyle that he strikes at the root of the error, as he deems it, by declaring that the history of the world is fundamentally nothing more than the biography of great men ("Lectures"). This is to plead, distinctly enough, against the idea which rules the movement of the times. . . .

> In the name of the democratic spirit of the age, I protest against such views. History is not the biography of great men; the history of mankind is the history of the progressive religion of mankind, and of the translation by symbols or external actions of that religion. . . .
>
> The great men of the earth are but the marking stones on the road to humanity; they are the priests of its religion. What priest is equal in the balance to the whole religion of which he is a minister? There is yet something greater, more divinely mysterious, than all the great men, and that is the earth which bears them, the human race which includes them, the thought of God which stirs within them, and which the whole human race collectively can alone accomplish. Disown not, then, the common mother, for the sake of certain of her children, however privileged they may be; for at the same time that you disown her you will lose the true comprehension of these rare men whom you admire. Genius is like the flower which draws one half of its life from the moisture that circulates in the earth, and inhales the other half from the atmosphere. The inspiration of genius belongs one half to heaven, the other to the crowd of common mortals from whose life it springs.

Yet we doubt if this does full justice to the work that Carlyle accomplished. It was Carlyle's great mission to discover and to proclaim to this generation the world's need of God. And this he did as no other man in all this century, not even excepting the great Italian himself. "The beginning and the end of what is the matter with us," writes Mazzini, "is that we have forgotten God." This is also the beginning and the end of Carlyle's teaching. He saw through all the shams of his day. He was the great unmasker. He showed the pettiness and the selfishness and the nothingness of the Manchester economy. He blew the clouds away that hid God from the world. Above all, Carlyle saw God *in man*. "Thou, too, art man," he said, "the breath of God is in thee; thou art here below to develop thy being under all its aspects; thy body is a temple; thy immortal soul is the priest, which ought to do sacrifice and ministry for all."

Carlyle's social writings were not his first. They belong to his best period. "Signs of the Times" was first published in the *Edinburgh Review*, and written perhaps at the very time he was writing "Sartor Resartus." "Chartism" (1839), and "Past and Present" (1843) appeared soon after "The French Revolution" (1837). These are his main writings on social themes. He died in 1881.

CARNEGIE, ANDREW: American manufacturer and philanthropist; born at Dunfermline, Scotland, 1835. His father, a weaver in humble circumstances, but ambitious to rise, and an ardent republican, came with his family to the United States in 1845, and settled in Pittsburg. Two years afterward Andrew began his career by tending a small stationary engine, later becoming a telegraph messenger and operator, and being one of the first to read telegraphic signals by sound. He became clerk to the superintendent of the Pennsylvania Railroad, and manager of the telegraph lines. In this position he began making small investments, and so gained the nucleus of his wealth. Promoted to be superintendent of the Pittsburg division of the Pennsylvania Railroad, he was one of a syndicate who purchased property on Oil Creek, which cost $40,000, and in one year yielded over $1,000,000 in cash dividends. He was subsequently associated with others in establishing a rolling-mill, from which has grown the most extensive and complete system of iron and steel industries ever controlled by any individual. He was the first in any large way to introduce the Bessemer process (1868). Mr. Carnegie was the principal owner of the Homestead and Edgar Thomson Steel Works and of other large concerns. In 1899 these interests were consolidated in the Carnegie Steel Company, and two years later Mr. Carnegie sold out to the United States Steel Corporation and retired from business.

Besides directing his great industries, Mr. Carnegie was for a long time the owner of eighteen English newspapers which he controlled in the interests of Radicalism. He has devoted large sums of money to benevolent and educational purposes. In 1879 he erected commodious swimming-baths for the use of the people of Dunfermline, Scotland, and in the following year gave $40,000 for the establishment of a free library, which has since received other large donations. In 1884 he gave $50,000 to Bellevue Hospital Medical College to found a historical laboratory, now called the Carnegie Laboratory. Since then he has endowed libraries to many towns and cities in the United States and Great Britain. His total benefactions have been put at $75,000,000, including $10,000,000 to the Carnegie Institution, Pittsburg; $10,000,000 to the Carnegie Institution, Washington (for advance research work); $10,000,000 to Scottish universities; $10,000,000 for a collegiate professors' pension fund; and $5,200,000 for branch libraries in New York City. His total library donations aggregate more than $40,000,000 for some 1,500 public libraries. In addition to numerous contributions to periodicals, on the labor question and similar topics, Mr. Carnegie is the author of: "An American Four-in-Hand in Britain" (1883); "Round the World" (1884); "Triumphant Democracy" (1886); "The Gospel of Wealth" (1900); "Empire of Business" (1902). *Address*: 2 East Ninety-first Street, New York City.

CARPENTER, EDWARD: English writer; born at Brighton, England, 1844; graduated at Cambridge in 1868, and took orders in 1869. He was for a time curate to the Rev. F. D. Maurice, at St. Edward's, Cambridge, where he also held a fellowship. About 1871, he changed his religious views, and, resigning his fellowship and curacy, was for seven years a university extension lecturer on science, music, etc. In 1877 he visited the United States, seeing Walt Whitman among others. In 1881 he took to a simple yet artistic farm life, somewhat after the idea of Thoreau, near Sheffield, and began writing "Toward Democracy," issued in 1883, when he first definitely joined the Socialist movement. In 1886 he commenced making sandals, in which he now carries on quite a trade. His farm is at Holmsfield, Sheffield. As an example of Mr. Carpenter's thought and style we quote the following passage from his "Civilization: Its Cause and Cure" (pp. 39, 40):

> To-day it is unfortunately perfectly true that man is the only animal who, instead of adorning and beautifying, makes nature hideous by his presence. This was the great glory of the Greeks, that they accepted and perfected nature; as the Parthenon sprang out of the limestone terraces of the Acropolis, carrying the natural lines of the rock by gradations scarce perceptible into the finished and human beauty of frieze and pediment. And some day we shall again understand this which, in the very sunrise of true art, the Greeks so well understood. Possibly some day we shall again build our houses or dwelling-places so simple and elemental in character that they will fit in the nooks of the hills or along the banks of the streams or by the edges of the woods without disturbing the harmony of the landscape or the songs of the birds. No need for private accumulations. Gladly will each man, and more gladly still each woman, take his or her treasures, except what are immediately or necessarily in use, to the

common center, where their value will be increased a hundred and a thousandfold by the greater number of those who can enjoy them, and where far more perfectly and with far less toil they can be tended than if scattered abroad in private hands. At one stroke half the labor and all the anxiety of domestic caretaking will be annihilated. The private dwelling-places, no longer costly and labyrinthine in proportion to the value and number of the treasures they contain, will need no longer to have doors and windows jealously closed against fellow-man or mother nature. The sun and air will have access to them, the indwellers will have unfettered egress. Neither man nor woman will be tied in slavery to the lodge which they inhabit; and in becoming once more a part of nature, the human habitation will at length cease to be what it is now for, at least, half the human race—a prison.

Among Carpenter's works may be mentioned "Toward Democracy"; "England's Ideal"; "Chants of Labor"; "Civilization: Its Cause and Cure"; Love's Coming of Age." *Address*: Holmsfield, Sheffield, England.

CARPENTERS AND JOINERS, AMALGAMATED SOCIETY OF: An important English trade-union with branches in the United States. Organized in England in 1860. It reported in 1905 62,212 members in 883 branches in Great Britain and 8,551 members abroad, of which 4,800 were in the U. S. In 1904 the total income of the society was £181,449, and it had funds of £156,627 at the beginning of the year. Its working expenses were £32,301, with £189,249 spent in benefits, of which £90,814 were unemployed, traveling and emigration benefits.

CARPENTERS AND JOINERS OF AMERICA, BROTHERHOOD OF: One of the most important of American trade-unions, organized at Chicago, 1881. Prior to this there had been attempts at a national union, the first as early as 1854, but none had succeeded. This organization, however, met with large success. As early as 1886 the general secretary writes:

In twenty-one cities our local unions have gained twenty-five cents per day advance in wages, making in all fifty-three cities where our local unions have made gains the past year, either in more wages or in reducing hours, while only in nine cities have our local unions failed to secure their demands, and in these cities they demanded the eight-hour system last May. A résumé shows that 2,486 of our members are working eight hours per day, 5,824 are on nine hours per day, and 1,118 are having shorter hours on Saturdays. This makes a total gain to these members of 65,894 hours per week, adding to the gains on the Pacific coast, which amount to 6,540 hours per week, makes a sum total of 72,434 hours per week gained to our members through organization.

It was because of their complete organization and success that to the carpenters was given the honor of leading off in the great strikes of the American Federation of Labor on May 1, 1890.

The movement was successful in 137 cities and benefited 46,197 men. In other cities it failed, or only partially succeeded. By 1894 the Brotherhood had 824 lodges and 65,000 members. By 1903 the union had 109,000 members, and in 1905, 143,200. It paid out in that year $189,045 in death benefits. In some cities it has had some contests with the rival, tho much smaller Amalgamated Society of Carpenters and Joiners, a society originating in England. The secretary is F. Duffy, P. O. box 520, Indianapolis, Ind.

CARR, EDWARD ELLIS: American editor; Christian Socialist; born near Hidalgo, Ill., 1866; entered ministry of Methodist Church in 1887; officiated successively as missionary in Utah, and as evangelist and pastor in Illinois. In 1898, for theological reasons, he honorably withdrew from the Methodist Church; and in the following year he became pastor of the People's Church, Kalamazoo, Mich. He joined the Socialist Party in 1900, and is now its state committeeman and national organizer. Carr lectures on socialism and popular themes; besides which he is manager of two summer Chautauqua Assemblies. He is a careful student and an able speaker, and stands uncompromisingly for the union of religion and socialism. In 1906 he was influential in starting the CHRISTIAN SOCIALIST FELLOWSHIP. *Address*: 5406 Drexel Ave., Chicago, Ill.

CARTER, JOHN: Secretary of The (English) Christian Social Union; born in Toronto, Canada, 1861; educated at Upper Canada College, Trinity University, Toronto, and at Exeter College, Oxford (M.A., 1887). After serving for two years as curate in East London, he returned to Oxford, to Pusey House, under its first principal, the Rev. Charles Gore, now Bishop of Birmingham. He was one of the founders of the Christian Social Union, and has been closely identified with its work since its inception in 1889. Besides being general secretary of the main body, he has acted also as honorary secretary of the Oxford University branch. Since its foundation in 1891, he has been editor of the quarterly *Economic Review*. He has been also for several years a member of the Oxford Town Council, as one of the representatives elected by the university. He is in favor of municipal and State socialism, but is most of all concerned to bring the Christian conscience to bear upon modern social problems without being necessarily committed to any particular economic system or political party. *Address*: Pusey House, Oxford, England.

CASSON, HERBERT N.: Magazine editor; born at Ontario, Canada, 1869; educated in Victoria College, Coburg; came to Boston in 1891, and became prominent through his advocacy of public employment of the unemployed. In 1893 he founded at Lynn, Mass., the first labor church in America. Later he joined the Socialist colony at Ruskin, Tenn. In 1898 he was on the editorial staffs of *The New York World* and *The Journal*, and is now (1907) one of the editors of *Munsey's Magazine*. He is an Opportunist Socialist, and is strongly opposed to the Marxian political party. Altho in favor of public ownership of public necessities, he thinks that this should be brought about gradually as the people become competent for such responsibilities. He is the author of: "Organized Self-Help," a history of American trade-unions; "Crime of Credulity"; and "The Romance of Steel and Iron." *Address*: Care of Frank A. Munsey & Co., Flatiron Building, New York City.

CASTRATION: Members of the medical profession frequently recommend castration as a punishment for certain offenses, and as a method of treatment for "sexual perverts." Boies's recent work on "Prisoners and Paupers" culminates in this recommendation. While advances in modern surgery make this a comparatively safe and painless operation, it is doubtful if it will be permitted by modern communities.

Prof. A. G. Warner thinks it may ultimately be very widely used in the treatment of the diseased and criminal classes. He says ("American Charities," p. 133):

"It is likely to be introduced first as a curative treatment in the cases of the insane and the

feeble-minded. Dr. Kerlin, in addressing the Association of Medical Officers of Institutions for the Feeble-Minded, said: 'While considering the help that advanced surgery is to give us, I will refer to a conviction that I have that lifelong salutary results to many of our boys and girls would be realized if before adolescence the procreative organs were removed. My experience extends to only a single case to confirm this conviction; but when I consider the great benefit that this young woman has received, the entire arrest of an epileptic tendency, as well as the removal of inordinate desires which made her an offense to the community; when I see the tranquil, well-ordered life she is leading, her usefulness and industry in the circle in which she moves, and know that surgery has been her salvation from vice and degradation, I am deeply thankful to the benevolent lady whose loyalty to science and comprehensive charity made this operation possible.'"

CATHOLIC TOTAL ABSTINENCE UNION OF AMERICA (1872): A confederation of all the Catholic temperance societies in the country that are approved by the pastors of their respective churches. It embraces 89,400 members, enrolled in 1,042 societies. Its objects are to secure to its members the privilege of being received into societies connected with the union in any part of America; to encourage and aid communities and pastors in establishing new societies, and to spread, by means of Catholic total abstinence publications, correct views regarding total abstinence principles. President, Rt. Rev. J. F. R. Canevin, Bishop of Pittsburg, and General Secretary, J. W. Logue, 1313 Stephen Girard Building, Philadelphia, Pa.

CENTRAL PUBLIC HOUSE TRUST ASSOCIATION: This association was formed in 1901 "for the purposes of promoting temperance by the elimination of private profit from the retail sale of liquor and of securing to the public the monopoly value of licenses."

Its objects are:

(1) To secure the establishment in every county or in other sufficient area of a local trust company or association for the purpose of undertaking the disinterested management of the liquor trade.

(2) To promote the interests of such trust companies wherever formed; to watch on their behalf the administration of the licensing laws; and to secure such amendments as may facilitate the development of the trust system.

(3) To collect information of all experiments whether in this country or abroad in the disinterested management of the liquor trade.

The origin of the movement dates from 1877 when the Rev. Osbert Mordaunt on his appointment to the parish of Hampton Lucy in Warwickshire found himself sole trustee of the village inn. He determined to manage it on the Gothenburg system, the main principles being: (*a*) that the liquor sold should be *pure*; (*b*) that the person who sells the beer should have no interest in the profits.

This experiment was followed by others, and in 1896 the Bishop of Chester and the late Colonel Craufurd formed the People's Refreshment House Association to manage public houses on reformed lines.

The success of this association's work led Lord Grey to form in 1901 the Central Public House Trust Association.

There are now 32 Public House Trust Companies in England and Wales, 5 in Scotland, and 1 in Ireland, managing 210 public houses, a number which is constantly increasing.

The principle underlying the temperance reform at which these trust companies are aiming is the elimination of the element of personal profit from the sale of alcoholic liquors. Accordingly, the dividend payable on the capital subscribed is limited to five per cent per annum, and thus the shareholders have only a nominal monetary interest in the trade. All surplus profits are handed to a council to be applied to objects of public benefit other than those properly chargeable to the rates, the provision of counter-attractions to public houses being especially kept in view.

The houses under trust management are conducted as refreshment houses rather than as mere drinking bars; food, as well as non-intoxicating drinks, including tea, coffee, and cocoa, are as readily served to customers as beer or spirits; and the food and drink supplied are of the best quality obtainable. The managers are paid a fixed salary. They have no interest whatever in the profits arising from the sale of intoxicants, and are, in consequence, under no inducement to push this part of the trade. On the other hand, they are encouraged to promote the sale of food and non-intoxicants.

Further, the elimination of the element of private profit in the sale of alcoholics places the interest of a manager on the side of law and order, and removes the antagonism which at present exists between the interest of the retailer of drink and the public welfare.

The assertion of Messrs. Rowntree and Sherwell, never yet disputed, that the net profits realized during the year 1899 by the public houses and beer shops of the United Kingdom amounted to the huge figure of £19,400,000, shows how great a loss the nation has sustained from a licensing system which has allowed the high profits resulting from monopoly rights to be diverted from the pockets of the community to whom they belong to those of privileged individuals.

It has been recently ascertained that between seventy and eighty per cent of the public houses are now in the hands of the big brewery companies; that is to say, these companies have either bought the houses outright or have by other means obtained a financial hold on the establishment, so that the house is "tied" to the brewery. The first object of this "tie," and its first consequence, is the condition that all liquors shall be bought from the brewery.

The following are extracts from the instructions drawn up by the People's Refreshment House Association for the use of their managers and adopted by the various Public House Trust Companies.

The manager placed in charge of a public house belonging to the association must bear in mind that he has been appointed by the Council to conduct the management on certain fixed principles.

These principles are:

(1) That the general arrangement and management of the house shall be on the lines of a house of refreshment instead of a mere drinking bar.

(2) That food and a good variety of non-intoxicant drinks shall be as easily accessible to customers as beer and spirits.

(3) That the licensing laws enacted by Parliament for the regulation of public houses, and the promotion of temperance, shall be most strictly carried out in every particular.

(4) That the holder of a license is in a sense a servant of the public, and that he must study the comfort, well-being, and health of his customers; that his house must therefore be scrupulously clean, and that the rooms most used by the public must be comfortably arranged, well warmed in winter, and well ventilated.

The tariff of prices is to be placed conspicuously in the bar, taproom, and parlor, and the prices thereon advertised must not be departed from.

Intoxicants are not to be exposed with a view to attract customers, but every means is to be taken on the other hand to expose food and non-alcoholic drinks, so as to encourage their consumption.

In addition to the registered companies with a total subscribed capital of over £300,000, committees have been appointed in those parts of the United Kingdom which are not yet provided with trust companies for the purpose of promoting their formation.

Further, the promises of landowners to hand over to the trust companies of their respective counties the licensed houses on their estates, on the expiration of current leases, warrant the anticipation that the number of licensed houses that will come under trust management from this source alone will in the near future more than double the number of those already secured.

In various parts of Great Britain, in Ontario, Manitoba, South Australia, New Zealand, Tasmania, Mauritius, Natal, and the Transvaal, active agencies are at work forming a public opinion in favor of applying trust principles to the management of monopoly houses.

From individual reports all pointing one way, we give the following:

"The Waterman's Arms," Bankside, Southwark (the first "Trust" house in London), was opened for business, after rebuilding, on Jan. 14, 1904. Situated in a working-class district, it now does a busy trade in cheap breakfasts, dinners, and teas. At the bar in the workmen's dining hall about eight gallons of tea and coffee are sold by 10 A.M. each day. There is a saloon dining-room on the first floor, in which luncheons and teas are provided at a moderate price. The takings for food and temperance drinks are frequently larger than the sales at the bar, though under the previous tenant practically nothing was sold but beer and spirits.

It is to be noted that the takings for alcoholics in 1903 were about £420 less than in 1902 at the houses managed throughout the two years, and that the years 1902 and 1901 had already shown a decrease of nearly £500 as compared with 1900. On the other hand, every facility is given for the supply of tea, coffee, etc., and there has been a steady demand for bowls of cheap soup at several of our country inns.

The secretary of the association is Hugh A. Paget, 15, Dean's Yard, London, S. W.

FURNISHED BY EARL GREY.

CENTRALIZATION is used in social science for the tendency to administer, by the sovereign or the central government, matters which might be placed under local management. The legitimate application is to a state of change from local to central management. Europe to-day is profoundly moved by the tendency, and has been ever since the existing European states began to grow out of the chaos of the fall of the Roman empire. That empire itself was, however, the greatest instance of centralization which the world has yet seen. In it the numerous municipalities and other local organizations originally existing in Italy, and communicated to the colonies, were entirely centralized. In England we can trace centralization from the time when there were about a dozen kings in Britain, and perhaps as many in Ireland, till the United Kingdom came under the rule of one monarch. In other countries—as, for instance, in France, notwithstanding her desperate struggles for freedom—the process long tended to a pure irresponsible despotism, but now has issued in a centralized republicanism. The British Constitution turns the process to use instead of mischief. While administrative authority has been centralizing in the crown, the controlling power of Parliament has been increasing more rapidly, so that the vesting of a function in the crown means the putting it under the control of Parliament, and especially of the House of Commons. There is nothing done in any of the offices under the government for which a secretary of state, or some other member of the ministry, may not at any time be called to account. The creation of the county councils is a recent step in this direction in a somewhat different line.

In the United States the problem of centralization or decentralization has, under different names (see STATE RIGHTS), played a very important part. It may be said to be the distinguishing point between the two great political parties which, under different names, have from the beginning divided this country.

In the first continental congresses, the fundamental problem was how much power to give each state, and when the Constitution was proposed, this was still the burning question.

In the United States

Led by Hamilton, the men who believed in a somewhat strong central government gradually took the name of Federalists, gaining their ideas mainly from England; while, largely under the lead of Jefferson, those who believed in giving much power to the states and little to the central government took the name of Republicans or Democratic-Republicans, and are the direct ancestors of the present Democratic Party. Washington, though in reality of neither party, was by force of circumstances a Federalist, and during his presidency (1789–97), with that of Adams (1797–1801), this party was in power, giving us the necessary unifying elements of our Constitution, especially as regards financial measures. Then, owing to Federalist errors, the Republican-Democratic Party came into power with Jefferson (1801–1809), Madison (1809–17), and Monroe (1817–25). During this long period of "Jefferson democracy," the decentralizing state-rights influence was in power. The doctrine that that was the best government which governed least applied to the states, but especially to the central government. The Jeffersonian party was strong with the masses and the agricultural interests. Jefferson did away with much of the ceremonialism of Washington. The Federalists were strong with the commercial and manufacturing interests and the Puritanism of New England, which, in spite of worship of the local "town-meeting" self-government, revolted at the atheism of the French Revolution, and connected it with the Democratic-Republican Party. In general the Federalists stood for a loose construction of the Constitution, since this gave them opportunity to expand the central powers, altho they were ready to resist Congress when it stood in their way (there was even talk of a secession of the trading states from the union), while the Jeffersonians generally favored strict construction, since that would limit the powers of government; yet they were willing even to violate the Constitution, if that were necessary, to effect the purchase of Louisiana. Hamilton, however, died in 1803, and the Federalists had no leader.

In 1825, however, there came a change. Sectional quarrels under Monroe led to the election of John Quincy Adams (1825–29), who was, on the whole, a Federalist, tho he had toyed with the Republican-Democrats; and under the personal influence of Clay and Jackson, two great parties were again developed—the one, under the name of Democrats, maintaining the traditions of the old Democratic-Republican Party, and electing its candidate, Andrew Jackson (1829–37); the other, under the name, first, of National Republican and then Whig, maintaining the principles of the Federalists. The question of centralization was at this time carried out in another direction, in Jackson's vehement attack upon the National Bank of North America, which had been chartered by Congress. (See BANKS AND BANKING.) Resting mainly upon the Southern and agricultural vote, the Democrats were inclined to free trade, while the Whigs, with their manufacturing interests, favored protection. Meanwhile, another great question, which, while it had existed from the beginning, only now became so serious, was modified by the same

contest between centralizing and decentralizing tendencies. The South, mainly Jeffersonian, or Democratic, believed in state rights and slavery. The North, more Federalist, or Whig, gradually came to oppose slavery. Nevertheless, the Southern Democrats feared to break with Northern Democrats, and the Northern Whigs feared to alienate the South, and, therefore, temporized. The result was a complication of issues, the springing up of new parties—Abolitionists, Free Soilers, etc.—and the election of Van Buren (1837–41), Democrat; W. H. Harrison, who died shortly after his inauguration (1841), Whig, leaving John Tyler President (1841–45), who was only nominally a Whig, and really a Democrat; James K. Polk (1845–49), Democrat; Zachary Taylor (1849), Whig, who also died soon after inauguration, leaving Fillmore President (1850–53), Whig; Pierce (1853–57), Democrat; Buchanan (1857–61), Democrat.

State Rights

The War of the Rebellion was fought not directly to abolish slavery, but to preserve the union by conquering the states which had pushed the decentralizing state-rights doctrine to the extreme of secession. The Whig Party had now given place to a new party, the Republican, made up of Whigs, Free Soilers, and others, which yet on questions of centralization, protection, etc., carried out Whig principles. The election of Lincoln (1861–65), Republican; the victory of the North; Lincoln's assassination, Andrew Johnson, Vice-President, becoming President (1865–69), Republican, are well known.

Since the war the state-rights question has been less prominent, it having been largely settled by the war; but the centralizing or decentralizing question has still remained. The tendency, however, tho much criticized, is strongly toward centralization. The federal government almost inevitably steadily extends its control and its legislation over whole domains formerly left too exclusively to state action, e. g., interstate commerce, proposals for federal control of banking, insurance, etc., propositions for federal divorce laws, etc.

The present growing problems of social reform are also affected by the same tendencies, some advocating a highly centralized government; others (even most Socialists and nationalists) advocating a decentralized government, with great emphasis on local self-government, as developed in the old Saxon folk-mote and the New England town-meeting, giving us municipalism as even more important than the national element of nationalism, which includes all governmental action, state and municipal. Many Socialists, and notably William Morris in England, favor a government so decentralized as to be little more than a confederation of communes.

This brief résumé will indicate how far this question has entered into our national history and how far it may yet affect our national politics and procedure.

CHALMERS, THOMAS: Scottish clergyman; political economist; born at Anstruther, Fife County, 1780. He was early destined for the Church, and at the age of eleven was enrolled as a student in the University of St. Andrews. In 1803 he was ordained as minister of Kilmany, a small parish near St. Andrews. He taught classes at St. Andrews, and gained great popularity and fame throughout all Scotland. In 1815, after a battle over his evangelical views, which were then much opposed, he became minister of the great Tron parish, in Glasgow, and in 1819 of the parish of St. John's. In 1828 he accepted the chair of theology in Edinburgh. Here he finished, in three volumes, his "Christian and Civic Economy in Large Towns," and his "Political Economy," besides many theological and philosophical works. Here, too, he had more leisure for general church activities, and he was placed at the head of the Church Extension Committee. After the withdrawal from the General Assembly (1842), Dr. Chalmers was the first moderator of the Free Church of Scotland.

In visiting his first Glasgow parish, which contained a population of about 11,000 souls, Chalmers speedily discovered that nearly a third of them had relinquished all connection with any Christian church, and that their children were growing up in ignorance and vice. The appalling magnitude of the evil, and the certainty of its speedy and frightful growth, at once arrested and engrossed him. To devise and execute the means of checking and subduing it became thenceforth one of the ruling passions of his life. Attributing the evil to the absence of those parochial influences, educational and ministerial, which wrought so effectually for good in the smaller rural parishes, but which had not been brought to bear upon the overgrown parishes of great cities, from all spiritual oversight of which the members of the Establishment had retired in despair, his grand panacea was to revivify, remodel, and extend the old parochial economy of Scotland. Taking his own parish as a specimen, and gaging by it the spiritual necessities of the city, he did not hesitate to publish it as his conviction that not less than twenty new churches and parishes should immediately be erected in Glasgow. All, however, that he could persuade the town council to attempt was to erect a single additional one, to which a parish containing no fewer than 10,000 souls was attached.

Social Experiments

In 1819 he became minister of the parish of St. John's. This parish contained 2,000 families, chiefly weavers, factory operatives, and laborers. More than 800 families had no connection with any church; and nearly all the children were uneducated. He at once established two large school-houses, in which 700 children were taught at very low fees. For those too poor to afford even a small school fee he opened forty or fifty Sabbath-schools. In a short time these Sabbath-schools contained 1,000 children. Dr. Chalmers then divided his parish into twenty-five districts, and placed over each an elder, to watch over the spiritual interests of the people, and a deacon, to care for their temporal interests. He retained control and direction of all, not only overseeing the work of others, but making 1,000 visits among the families annually, and holding evening meetings. It was his special desire to test the old Scotch method of caring for the poor—by voluntary contributions taken at the church door and administered by the kirk session. He was strongly against the English system of compulsory assessment; and obtained permission of the Glasgow magistrates to try the Scotch plan with St. John's. His experiment was a complete success. When he took the parish its poor cost the city about $7,000 a year; but after four years of his management this sum was reduced to less than $1,400 a year. This was done by his thorough organization of the parish, his rejection of the idle, drunken, and vicious, his personal visits among the poor and kindly sympathy with them, and his stimulation of the needy to self-respect and industry.

Chalmers's "Political Economy" seeks to secure the economic elevation of society by moral means. He defined political economy as the "diffusion of sufficiency and comfort." He believed that without a Christian education to give self-control, progress would be impossible. He felt the need of a more radical cure than philanthropy and a more sympathetic one than legislation. He favored home trade rather than foreign trade. His economic idol was agriculture, as giving both occupation and maintenance. He died in 1847.

CHARITIES, STATE BOARDS OF: State Boards of Charities, under one name or another, but with the same general purposes, exist in a number of the states. They are branches of their respective state governments, usually created by legislative enactment, altho in some states provided for in state constitutions, because it has been found desirable, in the interest of good administration, to exercise independent supervision over charitable and kindred institutions. As a rule, these boards are composed of philanthropic citizens, appointed by the governor, and in some cases confirmed by the legislature, who are independent of partizan influences and render practically unpaid service to the state.

Generally speaking, the chief functions of these boards are to visit and inspect charitable and reformatory institutions in order to secure the correction of evils and abuses in their administration and to encourage the adoption of progressive methods in their management. Such boards have, usually, but limited powers of administration or control, in so far as the actual management of the institutions within their jurisdiction is concerned. Their powers and duties are, however, continually being added to as the growth and complexity of charitable work in their respective states makes this appear to be necessary. For this reason the duties of the several boards

differ materially in some of the details of work, while in the main they are the same.

The influence they exert, while almost entirely a moral one, is shown by experience to be both efficient and useful. This will readily be apparent to those who study the conditions at the almshouses and other public institutions of charity both previous to and since the establishment of State Boards of Charities. At the same time, it is also true that other social forces have cooperated to secure the great improvements that have been made during recent years in the administration of this general class of institutions.

The first State Board of Charities was established in Massachusetts in 1865, and is still in existence. Other like boards are to be found in New York, 1867; Ohio, 1867; Pennsylvania, 1869; Illinois, 1869; North Carolina, 1869; Michigan, 1871; Connecticut, 1873; Nebraska, 1877; Indiana, 1889; South Dakota, 1890; Colorado, 1891; New Hampshire, 1895; Tennessee, 1895; Missouri, 1897; District of Columbia, 1900; California, 1903; and in Wyoming and Montana.

State Boards of Control are found in some of the states, but these boards are primarily administrative in their character, and take the place of the individual boards of trustees of the state institutions, rather than that of the boards of charities.

Such State Boards of Control are to be found in Kansas, 1868; Rhode Island, 1869; Arizona, 1894; Iowa, 1898; Minnesota, 1901; Washington, 1901. Fuller information with relation to the composition and work of these two classes of state boards may be found in the published proceedings of the National Conference of Charities and Corrections.

It is the custom of the State Boards of Charities and of the State Boards of Control to issue annual or biennial reports according to the legislative custom in their respective states, and to publish from time to time other useful documents with relation to their work. These reports and documents are usually to be found in the public and other principal libraries, and copies may be obtained upon application sent to the offices of the boards at their respective state capitals, where complaints calling for investigation and other communications should also be sent.

ROBERT W. HEBBERD,
Commissioner of Public Charities of the City of New York.

CHARITY ORGANIZATION SOCIETIES, or ASSOCIATED CHARITIES, are in their present form a distinctly modern movement. In 1819 the Rev. Dr. Chalmers (*q. v.*), in his parish at St. John's, Glasgow, comprising 10,000 souls, in the poorest part of the city, became convinced that miscellaneous almsgiving did more harm than good; and, with the consent of the civic authorities, he undertook to stop all such bestowal of alms, and instead to institute a system of friendly visiting among the needy by a corps of workers, who were only to give relief in case of extreme necessity, but to do all they could to enable the poor to help themselves. The result was considered very favorable; the amount of pauper relief was very much diminished, and yet there was less suffering than before. After Dr. Chalmers, however, left the parish, in 1823, the experiment dragged on for fourteen years and then came to an end. Meanwhile similar experiments on a smaller scale were made elsewhere. From 1828–1844 district visiting societies were formed in several London societies, while societies for repressing mendacity in begging were much older. In 1868 Edward Denison (*q. v.*), a son of the Bishop of Salisbury, went to live in the East End of London to study for himself at first hand the problems of the poor. He became convinced of the same principles at which Dr. Chalmers had arrived. He wrote:

"I am beginning seriously to believe that all bodily aid to the poor is a mistake; whereas by giving alms you keep them permanently crooked. Build schoolhouses, pay teachers, give prizes, frame workmen's clubs, help them to help themselves, lend them your brains, but give them no money, except what you sink in such undertakings."

As a result, in 1869 a society was formed to act upon these principles, organized by Denison and some friends spurred on by his words and the experience of Octavia Hill (*q. v.*) in her work with her poor tenants. The society was called the London Society for Organizing Charitable Relief and Repressing Mendicity, soon popularly abbreviated into the Charity Organization Society. The movement rapidly grew, and aimed at bringing all the vast charitable relief of London, whether legal, corporate, or individual, into one administration. It has not done this, but has become a vast and thoroughly oganized system, with a network throughout England.

In England and Wales there are at present nearly 100 charity organization societies (under different names), nine in Scotland, and two in Ireland. There are also seven in Canada, six in Australia, three in India, and nine in other British colonies.

In England

The (London) Charity Organization Society has headquarters at Denison House, Vauxhall Bridge Road, S. W., with district committees in each of the forty Poor Law Unions. It declares its object to be "to give a definite aim to and to direct into most effective channels the large amount of benevolent force at work in England and particularly in London." The central committee does not relieve directly, but aims at propagating sound views on the subject of charity by publication and discussion, promoting cooperation, suggesting new institutions on good principles, collecting information relating to individuals and of general import, and preventing misapplication. Its principles may be summed up as follows: (1) That all relief should aim at making the recipient independent of relief. (2) That no relief should be given without thorough inquiry and investigation. (3) That existing institutions should be utilized as far as possible. (4) That all relief should be adequate to secure the object with which it is given.

According to the Annual Charities Registry for 1906 the total income of the various charitable agencies reported that year in London was £8,720,986.

The United States

The history of charity organization in the United States has closely followed that of England. In the fifties there had been organized in almost all the large cities relief societies, usually called Societies for the Improvement of the Condition of the Poor. They were often conducted in theory upon principles of modern charity, but in practise, says Mr. Kellogg, "they sank into the sea of common almsgiving, appealing to their patrons for support on the ground that the money given to them would enable them to enlarge the number of their beneficiaries or increase the amount of their gifts, and attracting the needy to their doors with the hope of loaves and fishes. . . . From every quarter testimony arises that the system was without adequate safeguards of investigation, tests of destitution or means of hindering duplication of relief from several sources simultaneously, or of making the relief adequate to the necessity."

It was under such conditions that the movement toward charity organization commenced.

Beginnings

Altho the movement traces its origin to the London Society there were several independent centers in which it appeared nearly simultaneously in this country. In 1874 Rev. Charles G. Ames led in the formation, upon London models, of an association in Germantown, a suburban ward of Philadelphia, which employed household visitors to investigate applicants for aid, availed itself of the soup-houses, fuel societies, churches, and especially of the

outdoor municipal relief in procuring the requisite assistance, and supplemented it as need indicated from its own resources.

In the same year a Bureau of Charities was formed in New York City, of which Mr. Henry E. Pellew was chief promoter and secretary, that proposed to register persons receiving outdoor relief, either from the city, benevolent societies, or individuals; but the scheme was frustrated the next year by the refusal of the largest relief-giving society in the city to cooperate. This plan met with better success in Boston. In the autumn of 1875 the Cooperative Society of Visitors among the Poor was formed in Boston, whose theater of operation was in the North End. The plan was a modification of the Elberfeld system as proposed by Octavia Hill for London. No visitor was to have more than four "cases" on hand, and lists were obtained from a physician of that congested and poor district. The society held weekly conferences of visitors and representatives of other charities.

Buffalo has the honor of being the first city in the United States to produce a complete Charity Organization Society of the London type. The Rev. S. H. Gurteen, an English clergyman, who had been active in the London Society, proposed in 1877 the creation of a clearing office to which the charitable agencies of the city should send daily reports. On Dec. 11, 1877, the Charity Organization Society was set afoot at a public meeting.

Various Cities

In the spring of 1876 a Registration Committee was formed by private citizens of Boston, and work was begun in the autumn, carried on until the spring of 1878, and then abandoned in view of the larger enterprise then under discussion. The large relief societies knew the worth of registration, but doubted the value of "friendly visiting." They were willing to support the new movement, provided "the visitors had no power of relief." This condition was fortunately acceded to, and on Feb. 26, 1878, a provisional commission was formed by delegates from many charities, which carried on the work until December 8th, when the present constitution of the Associated Charities of Boston was adopted and went into effect.

New Haven was next in line, May 23, 1878.

Philadelphia brought forward its type in 1878. A large committee was appointed to draw up a plan, and on June 13, 1878, a constitution was adopted and a provisional organization set on foot. This instrument was dominated by the idea of reproducing in each of the thirty wards of the city a complete association like that existing in Germantown.

Cincinnati was in the field, Nov. 18, 1879.

Brooklyn was another center where the movement arose spontaneously. In 1877 a commission of citizens undertook the investigation of outdoor relief, which in that year comprized 46,350 beneficiaries and involved an expenditure of $141,207. This resulted in restricting municipal out-relief to coal in 1878, and in its total abolition the next year. In 1879 Mr. Seth Low, who had been providentially and unpremeditatedly present at the inauguration of the Buffalo society and deeply imprest thereby, enlisted Mr. Alfred T. White, and they, with others who had been instrumental in abolishing the outdoor relief of the city, together with the volunteer visitors of the out-poor, organized the Brooklyn Bureau of Charities, which does not give relief, but maintains wood-yards, laundries, workrooms, and a woman's lodging-house.

New York demands especial notice here. The difficulties encountered in securing influential cooperation in 1874 for a time paralyzed further effort, altho the necessity for some organization was long discussed by persons interested in charitable enterprises. In 1881 the matter was taken up by the State Board of Charities, and through its initiative the Charity Organization Society of the City of New York was founded in January, 1882, and incorporated on May 10th following. It followed the Boston plan in respect to the important features of giving no relief and of creating district associations maintained from a common treasury and under central control.

The movement found an expression of its unity in the National Conference of Charities and Corrections when, in 1879, Mr. Seth Low presented a description of the work in Brooklyn and a committee was appointed upon charity organization.

National Conference

There are at present some 300 associations, representing charity organizations in the world. Two hundred of these are in the U. S. and Canada. They are not organically connected, and perhaps the best way briefly to study them is to give a concrete statement of the objects of one of them, the Charity Organization of the City of New York. It is a society:

(1) For organizing and coordinating charitable work.

(2) For receiving applications for aid, carefully sifting and testing them, and obtaining from the proper sources prompt and adequate relief of such as are in need.

(3) For encouraging the establishment of new agencies where they are required; for giving expert confidential advice to the benevolent in their benefactions, and for giving accurate information in regard to charitable institutions, almoners, or agents that appeal for contributions.

(4) For helping the poor through wise counsel based upon experience, through personal service of volunteer visitors, and through all such means as will make them at the earliest possible moment self-supporting and self-respecting members of the community.

In addition to the Central Offices and Application Bureau in the United Charities Building, and the ten district offices in various parts of the city, the society conducts ten main departments, as follows:

(1) Investigation Bureau, United Charities Building. Investigations are made for private persons, hospitals, dispensaries and other institutions. For this purpose and to ascertain whether new families that make application are in need of aid, the society maintains a special corps of investigating agents in connection with the Registration Bureau.

(2) Registration Bureau, United Charities Building. A confidential record of all investigations made by the society, and of the action taken on behalf of families under its care. Information is given through the Central Office or by mail to those who have a legitimate charitable interest in the families concerned.

(3) Wood-yard, 516 West Twenty-eighth Street. To provide work for residents with families for a cash remuneration, and to test their willingness to work. Homeless men may earn meals and lodgings.

(4) Laundry, 516 West Twenty-eighth Street. To provide temporary employment for women with families. Expert laundresses are supplied through the employment registry of the laundry.

(5) The Penny Provident Fund, United Charities Building. For the encouragement of small savings through the stamp system.

(6) Publications. *Charities*, a weekly periodical of local and general philanthropy and of social activities; a means of communication among workers and of information to the public. Annual subscription, $2. "The Charities Directory," cloth, $1, published annually. It gives reliable information concerning the various charitable and beneficent institutions of New York City, carefully classified and fully indexed. "Handbook on the Prevention of Tuberculosis," 388 pp.; cloth, $1; paper, fifty cents. "The Directory of Institutions and Societies Dealing with Tuberculosis in the United States and Canada," 270 pp.; cloth, $1.

(7) Library, United Charities Building. A public reference library of applied sociology. All who are interested in charitable subjects are made welcome.

(8) Tenement House Committee, United Charities Building. To improve the condition of tenement-houses by securing proper legislation, by securing the enforcement of the existing laws, and by encouraging the building of model tenements.

(9) The Committee on the Prevention of Tuberculosis. By research into the social aspects of tuberculosis, by the publication of information concerning the curability and the communicable character of the diseases through lectures, leaflets, and otherwise; by the promotion of movements for the erection of sanatoria; by obtaining special relief for those whose chances of recovery will thus be increased and in other ways to aid in the movement for the prevention of the disease.

(10) The School of Philanthropy. To fit men and women for social service either as professional or as volunteer workers. Full information contained in the "Handbook of the School," which will be sent on application.

(11) The Department for the Improvement of Social Conditions. A complete list of the 200 charity organization societies in the U. S. and Canada is published each year in the annual report of the New York Charity Organization Society.

In Germany there are 29; France, 19; Austria, 9; Italy, 9; Belgium, 6; Russia, 5; Holland, 5; Switzerland, 4; Sweden and Norway, 3; Spain, 2; Denmark, 1; Greece, 1; Turkey, 1. (See also ELBERFELD SYSTEM.)

Revised by EDWARD T. DEVINE, Secretary of the New York Charity Organization Society.

CHARTISM: A movement in England for political and social reform, beginning about 1837 and extending over about seventeen years till 1854. The word is a shortened form of "Charterism," and rose from the "Charter" which was demanded by the advocates of reform at that time. [A copy of this may be found in Gammage's "History of the Chartist Movement," Appendix B, p. 411. It bears this title: "The

People's Charter. Being a bill to provide for the just representation of the people of Great Britain and Ireland in the Commons House of Parliament. Revised at a conference of the people, held at Birmingham, December, 1842."] The origin of this charter was both political and social, and illustrates how social and political causes were at the bottom of the Chartist movement.

The reform movement of 1832 had proved unsatisfactory to the working classes of England in that it had not done for them what they had been led to expect. It was indeed essentially a middle-class movement, and not a working-class movement at all. It accomplished this, that it established the representative principle as beyond question that of the English Constitution. It is but a step from this to manhood suffrage, but the Liberal Party was not yet ready to take this step. Only the radical members were ready for it in the House of Commons. At the same time the wretched condition in which the mass of the working people of England found themselves—such a condition as Charles Kingsley has described in "Yeast" and in "Alton Locke"—made the working classes ready for any scheme which would hold out to them any hope of relief. This led to the formation about this time in London of the Working Men's Association. Naturally enough this association and the radical element in the House of Commons came together. A committee was appointed, consisting partly of members of Parliament and partly of members of the association, which committee molded their views into a bill, afterward adopted at a public meeting. This bill was called "The People's Charter." Its principal demands were these, which may be called the six points of Chartism: (1) Universal manhood suffrage; (2) Annual Parliaments; (3) vote by ballot; (4) no property qualification; (5) payment of members; and (6) equal voting districts.

Six Points

With the members of Parliament who took part in thus inaugurating the movement it would seem largely to have been a matter of politics rather than of deep conviction. Perhaps they were scared at the specter which they raised. But it is certain that in a short time they ceased almost to a man to give it their support. Daniel O'Connell, for example, who is said to have handed the charter to Lovett with these words, "There, Lovett, is your charter; agitate for it and never be content with anything less," soon after did all he could to oppose it, and continued to the day of his death a bitter opponent of the Chartist movement.

But with the workingmen the case was very different. With them it was a question of paramount importance—a cause to which they devoted themselves with unbounded enthusiasm, if not always with discretion. Missionaries went out from the metropolitan association into all the great cities of England to form similar associations and to agitate for the charter. Some of these were men of exceptional ability. Perhaps the ablest as a writer and a man of business was William Lovett, the secretary of the association, a native of Cornwall, who had come in utter poverty to London and picked up the trade of a joiner. Another was Henry Vincent, a man gifted with singular powers as an orator. He is described as being extremely graceful in person, with a fine mellow, flexible voice, a most winning expression except in moments of passion, of great fluency of speech and rare power of imitation. He was regarded by his admirers as the young Demosthenes of English democracy. But the man who came to be regarded as perhaps most representative of the movement was Fergus O'Connor, an Irishman, who had first come into prominence in the Irish elections of 1831. Gaining the ear of the operatives in the manufacturing district he launched a paper called *The Northern Star*, which more than any other became the organ of the movement. O'Connor was its proprietor, but the Rev. William Hill its editor, which shows that some at least of the clergy were drawn in. Nor was *The Northern Star* the only paper devoted to the propaganda of the Charter, for the Workingmen's Association already had its journal in *The London Despatch*, while *The Northern Liberator* in Newcastle-upon-Tyne, *The True Scotsman* in Edinburgh, *The Birmingham Journal* in Birmingham, *The Operative*, *The Charter*, and *The Champion*, each presented some special aspect of the common cause.

During the summer and fall of 1838 the movement made rapid progress. Meetings were held in the great cities, where the number of people gathered would seem almost incredible, and where the enthusiasm was unbounded. At Glasgow there was a mighty demonstration on May 28th, when "it was computed that not fewer than 200,000 of the stalwart sons of labor displayed their toil-worn faces in this gigantic gathering. . . . "The very heavens rang with the lively strains of music and the shouts of the enthusiastic multitude. There were forty bands of music, and more than 200 flags and banners waved gracefully in the breeze." On June 27th a monster meeting was held on the Town Moor at Newcastle, where it was estimated that 80,000 people were assembled. Birmingham followed with a still larger meeting, and Manchester, not to be outdone, answered on Sept. 27th with a gathering which the reporter of *The Morning Advertiser* estimated at not less than 300,000. At these gatherings speeches were made on the wrongs of the working classes, and the good that would come from securing the charter. The speeches were always fervid, not seldom inflammatory, sometimes passing the bounds of right and reason. Delegates were also chosen to attend a convention to be held the following winter (Feb., 1839).

Growth

At this convention the weaknesses inherent in a movement of this sort began to show themselves. The convention was divided into two parties, one of which favored only peaceful methods, the other an ultimate appeal to force. The authorities could not pass by such language as was often used by agitators of the latter class, particularly when the great meetings, which had been held in the daytime, began to give place to torchlight processions at night, when it was plain that liberty of speech might easily pass over into license of action. Collisions between the authorities and the Chartist leaders or speakers became of frequent occurrence. At Birmingham Dr. Taylor, Lovett, and Collins were arrested, when the mob retaliated by setting fire to the property of some obnoxious individuals. Meanwhile the petition for the charter, signed by 1,280,000 persons, had been presented, on Jan. 14th, to the House of Commons, and turned down by the overwhelm-

Weaknesses of the Movement

ing vote of 237 to 48. This summary rejection of their demands, together with the frequent arrests of their members and the harsh treatment which they received, still further embittered the Chartists. At Newport, on Nov. 4, 1839, occurred what has been called "The Welsh Insurrection." A large body of the working people of the district (their number is variously estimated from 1,000 to 20,000), marched into Newport. Just what they had in mind seems uncertain, but it was probably a movement to release Vincent and other prominent Chartists who, it was reported, were being treated harshly in prison. Falling in with a company of the Forty-fifth Regiment, some shots were fired by the Chartists, and returned by the soldiers with deadly effect, ten of the Chartists being killed and fifty wounded. The leaders were arrested and tried for high treason, and three of them—Frost, Williams, and Jones—were sentenced to death, but their sentences were afterward commuted and they were transported. In other parts of England similar severe repressive measures were resorted to, while the movement was even more effectually checked by the divisions among its leaders. This appears from the fact that the second petition for the Charter, on its presentation to the House of Commons, had but 33,000 signatures.

The agitation for the Charter continued, however, till 1848, when it received its death-blow. The French revolution of that year for a time infused new hope and courage into the Chartists. Why could not that be done in England which had been done in France? It was determined to make an new appeal for the Charter to the House of Commons, and to back it up with such a display of members that it would be sure to receive the consideration it deserved. But, warned by what had taken place in France, the authorities determined to run no risk. The Duke of Wellington was put in charge of seeing that due precautions were taken. With his accustomed energy and wisdom the troops at his command were so disposed that they should not irritate the sympathizers with the movement, but would be ready at strategic points for immediate action. More than 200,000 special constables were sworn in, men of all ranks and conditions vying with one another in seeking the office. The marching in procession to the House of Commons, which had originally been planned, was forbidden, tho the Chartists were allowed to hold their meeting, so that the monster petition was presented on April 10, 1848, with little or no noise or tumult. The petition was so huge that it was carried in three cabs. It was presented by Fergus O'Connor, who claimed that it was signed by 5,700,000 people; but on being counted the actual number of signatures was found to be only 1,975,496. A considerable portion of these were palpable frauds, as among them were such names as Victoria Rex, the Duke of Wellington, and Sir Robert Peel; and multitudes of fictitious names were signed, such as Pugnose, Longnose, Flatnose, Punch, Snooks, Fubbs, etc. A petition thus discredited received but scant attention; and tho the Chartist movement struggled on for six or seven years longer, it had passed from the domain of practical consideration.

The Final Struggle

It is difficult to estimate the value and importance of the Chartist movement. Judged by what was immediately accomplished it would seem to have been a great failure, starting in an imposing manner and resulting in next to nothing. But it would be but a superficial judgment which would thus estimate the movement. The fact is that a large part of what the charter claimed has since been brought about. How much of what advance toward democracy England has made in the last twenty-five years is due to the Chartist movement it is impossible to say; but the reading of history would lead us to believe that the fruitage of the close of the nineteenth century, Liberalism, was in no inconsiderable measure due to the seeds planted at that time.

PHILO W. SPRAGUE.

CHASE, JOHN CALVIN: State secretary of Socialist Party of New York; born in Gilmonton, N. H., 1870. At the age of eight years he began work in a woolen mill, and at thirteen took up the trade of a shoemaker. He became a member of the Boot and Shoe Workers' Union in 1888, and was elected delegate to the National Convention in Boston. In 1890 he removed to Haverhill, Mass., where he worked as a shoemaker, and became an active trade-unionist and Socialist. He was elected Mayor of Haverhill in 1898, and reelected in 1899, being the first Socialist mayor elected in the United States. For two years he traveled as national organizer and lecturer for the Socialist Party of America. Mr. Chase believes that the working class should organize as a political party for the purpose of taking control of the government, so that through and by such control they may abolish private ownership of the means of life, and establish a system of collective ownership and operation. *Address*: 66 East Fourth Street, New York City.

CHAUTAUQUA INSTITUTION: In August, 1874, Lewis Miller, of Akron, O., and Bishop John H. Vincent organized the first Chautauqua Institution. Its name was derived from Chautauqua Lake, in New York State, on the shore of which the meeting was held. It began as a summer school for the better training of Bible teachers, and endeavored to lay most emphasis on the "week-day forces" in religious culture. Its two founders desired to give Sunday-school teachers a continued, progressive, and thorough study of biblical literature and pedagogical principles. The first meeting was a success; and by a gradual and natural growth the plan has been broadened to include instruction in almost all branches of knowledge; the session has been extended from two weeks to two months (July and August); and a town has been built up which presents an interesting study to the educator and sociologist in its municipal government and its ideals of life. All the essential features of the institution were adopted by 1878, tho various important changes and additions have promoted its consistent development from year to year. It is at present incorporated as Chautauqua Institution under the laws of the State of New York. Its management is entrusted to a board of twenty-four trustees, elected either by the owners of property at Chautauqua, or in case a quorum of such electors cannot be secured, by the board itself. The institution is not a stock company, nor are the

trustees interested in the land beyond the ownership of lots for private use. By the provisions of the charter, all surplus funds must be used for the improvement and extension of the institution's work. The president and chancellor never received compensation for their services. Those officers upon whom falls the management of details are paid ordinary salaries.

Chautauqua has become a city where municipal functions are extended to include free public instruction and entertainment. This expense is defrayed by a system of taxation which falls upon all within the town, however brief the term of citizenship. The tariff is: one day, 40 cents; one week, $1.75; two weeks, $2.80; four weeks, $4; season, $6. Citizenship includes the privilege of attending all exercises of the general program, and access to the museum, the reading-room, the models, etc.

The educational activities of Chautauqua Institution include the work done in connection with the Summer Assembly and the all-year-round instruction offered by the Chautauqua Library and Scientific Circle, and described hereafter.

The summer work of the assembly falls under two general heads: the Summer Schools and the General Program. The Summer Schools are thirteen in number, and in 1905 enrolled a total of over 2,300 students who were registered in nearly 5,000 courses. These schools may be described as including six academic departments and seven professional departments. Under the first head fall English language and literature, modern languages, classical languages, mathematics and science, psychology and pedagogy, and religious teaching. Under the second are included library training, domestic science, music, arts and crafts, expression, physical education, and practical arts.

The Faculty of the Summer Schools is in a measure as permanent as that of any college, the majority of the ninety members returning from year to year. A census of the last faculty shows representatives from Yale, Princeton, Columbia, Cornell, Michigan, and Chicago universities; from Amherst, Haverford, Bowdoin, and Rockford colleges; from Buffalo, New York, and West Chester (Pa.) normal schools; and from a large number of other educational institutions.

The second division of the summer work—the General Program—offers a regular and systematic series of religious and secular lectures, entertainments, and concerts, extending over sixty days. Under the head of lectures those which are most genuinely educational in their nature are a large number of lecture series on subjects of literary, historical, scientific, and pedagogic interest. In addition to these series many single addresses by persons of note are interspersed throughout the program. While the series are most often presented by educators, the single addresses are more frequently from men of affairs. During the history of the institution, three presidents of the United States, twelve or fifteen governors, thirty or more college presidents, and a long list of United States congressmen, distinguished jurists, and leaders in the world of commerce and civics have addressed Chautauqua audiences.

The musical features of the General Program have assumed significant proportions as the institution has developed. At present a chorus which at the height of the season numbers 500 or more, in conjunction with a regular orchestra of twenty pieces and with different groups of well-known vocal soloists, present during the season not only a large number of miscellaneous concerts, but at least three well-known opera scores, three great oratorios, and three or four of the best-known masses. Thus an opportunity is provided for people who ordinarily hear little of the best music; and the musical feature of the summer becomes distinctly educational. It is estimated that, through all of these means, over 50,000 people are reached each summer at Chautauqua itself.

One of the most important departments of the institution is the Chautauqua Literary and Scientific Circle. This was started in 1878, and offers aid to self-educating people, either as individuals or in groups known as "local circles." The essential features of the plan are:

1. *A definite four years' course* of history, literature, science, etc.
2. *Specified volumes* approved by the counselors.
3. *Allotment of time.* Reading apportioned by week and month.
4. *A monthly magazine* with additional readings, notes, and general literature.
5. *A membership book*, with suggestions, review outlines, etc.
6. *Time required*, forty minutes to an hour a day for nine months.
7. *Certificates* granted to all who complete the four years' course.
8. *Advanced courses*, for continued reading in special lines.
9. *Pedagogic course* for secular teaching.
10. *Young People's Reading Course* to stimulate the reading of good literature by the young.

Further details may be obtained from Chautauqua Institution, Chautauqua, N. Y.

CHERBULIEZ, ANTOINE ELYSÉE: Swiss professor; born in Geneva, 1797. He was in the Cantonal Legislature from 1831 to 1846, and till 1848 in the Great Council. From 1848 to 1851 he was in Paris, and then professor at Zurich, where he died in 1869. His main work is, "Précis de la Science Économique et de ses Principales Applications."

CHEVALIER, MICHEL: French engineer, editor, economist; born at Limoges, 1806. Commencing as a mining engineer, he gave this up in 1829 to join SAINT-SIMONISM and became editor-in-chief of the *Globe*. In 1832 he was condemned to a year's imprisonment, as the responsible agent of the *Globe*, for articles branded as being outrages on morality. His intentions were worthy, and his habits of life more strict than appearances led the world to suppose; hence the government itself, which at this time discovered M. Chevalier's abilities, remitted half the penalty, and entrusted to him the mission of studying the railways of the United States. He devoted himself henceforward to writing on engineering and economic subjects, and gradually but very materially changed his economic views. In 1841 he succeeded Rossi in the chair of political economy at the College of France.

In the Revolution of 1848 he opposed the socialism of the Commission du Gouvernement pour les Travailleurs. He wrote at that time in the *Journal des Débats* a series of letters called "Lettres sur l'Organisation du Travail," which were collected under this title. This and the "Lettres sur l'Amérique du Nord" may be considered his most characteristic and remarkable works.

Chevalier believed liberty to be more in peril under parliamentary government than under a personal government. He was called to the council of state February, 1852. In the same

year he published the "Examen du Système Commercial connu sous le nom de Système Protecteur," a work in which the advantage of commercial liberty was shown. He induced Napoleon III. to sign the famous commercial treaty with England of Jan. 23, 1860.

In 1859 Michel Chevalier published a new volume with the significant title, "De la Baisse probable de l'Or," in favor of the demonetization of gold. He resumed his duties as professor in 1866 and carried them on till 1878. He died in 1879.

CHEYSSON, EMILE: French engineer and economist; born at Nîmes (Gard) in 1836; became civil engineer in 1859, director of the machinery supply at the Paris exhibition 1867. From 1871 to 1874 he was general manager of the famous "Creuzot" mines and foundries. After this he left practical affairs to devote his time to studies and teaching. He has since been professor of engineering at the National School of Engineers and professor of statistics at the Free School for Political Sciences, and also inspector-general of bridges and highways. He has made a study of the labor question, and believes its solution lies in the forming of workmen's unions, which will act as savings-banks and in case of accident, loss of work, etc., as insurance companies. He does not believe in the German system of compulsory workmen's pensions. He has given especial attention to working men's dwellings and antialcoholism. He has written numerous reports and works bearing on statistics.

CHICAGO: In warring on the one hand against the greed of wealth and on the other hand against the lawlessness of labor, Chicago is developing a real democracy in government which its people believe bodes well for the future. This city of 2,000,000 inhabitants is truly cosmopolitan. The number of its citizens of foreign birth or parentage is large. It is a railroad and industrial center of great importance.

Like other American cities, Chicago has suffered from attempts to rule it from the state capital. More vigorously than most other cities has Chicago fought for the right of home rule in municipal affairs. The most acute phase of this struggle was in connection with the street-railway question, which for ten years has been the chief issue in municipal politics. In 1897 Mr. Charles T. Yerkes, the traction magnate, sought to have the legislature of Illinois give to him outright renewals of franchises which he desired in the city of Chicago. Mr. Yerkes was not only ultimately beaten at the state capital, but the public opposition which his policy aroused made it impossible for him to secure the desired franchise renewals from the city of Chicago, and in 1899 he sold out his interests and went to London. In 1903 the legislature passed a law, commonly known as the Mueller Law, conferring upon Chicago the right to own and operate street-railways. The Speaker of the House, by trying to kill this bill under the gavel, provoked a riot in the House, and was literally driven from the chair by infuriated members. He was not allowed to return until he agreed to grant a roll-call on the Mueller Bill. The demand for the Mueller Law came not only from advocates of municipal ownership, but from all the citizens of Chicago, who believed the city should have from the legislature the power to work out the problem in the way that seemed best to its people. In 1905 Mr. E. F. Dunne was elected mayor on the issue of immediate municipal ownership of street-railways. The practical difficulties in the way of immediate municipalization were too great to be overcome, and at the time this article is written it is probable that the question will be settled by the passage of an ordinance authorizing the companies to rehabilitate and operate the street-car system under an agreement to sell to the city at any time on six months' notice. An important instrumentality of the people in making their will effective has been the Public Opinion Law, under which, on petition of twenty-five per cent of the voters, any question of public policy may be submitted to the electorate. Under this law several referendum votes were taken upon various phases of the street-car question, all of which showed a surprisingly strong sentiment in favor of municipal ownership.

Railway Question

A struggle somewhat similar in nature, tho not so prolonged, was made to secure from the Illinois Legislature an act authorizing the City Council to regulate the price of gas and electric light. Under authority of this law the council, at the beginning of 1906, reduced the price of gas from $1 to eighty-five cents per 1,000 cubic feet. In the summer of 1906 the electric-light companies made material reduction in the price of light. The city of Chicago has the largest municipal electric-lighting plant in the country, but it provides light for public use only.

Chicago's water-plant has been owned and operated by the city since 1853. The water is taken from Lake Michigan. As the sewers also entered the lake the water-supply was contaminated. To purify the water-supply, and also to lay the foundation for a great ship canal connecting Lake Michigan with the Mississippi River and the Gulf of Mexico, the Sanitary District Canal was planned. A canal capable of accommodating large draft vessels has been constructed, connecting the Chicago River near its mouth with the Illinois River near Joliet. The current in the Chicago River is reversed, and water from Lake Michigan now flows through the Chicago River, the Sanitary District Canal, the Illinois River, and the Mississippi River into the Gulf of Mexico. The cost of the project has been about $48,000,000. The demand is now made that the Federal Government take the Sanitary District Canal as a basis, and build a ship canal connecting Lake Michigan with the Gulf of Mexico. Altho Chicago has only a very small debt, it has no additional borrowing power because of the limitations of the state constitution. As a means of evading this limitation, to make possible the raising of funds by bond issues for the construction of the canal, a new municipality was created, known as the Sanitary District of Chicago, having nearly the same territorial limits as the city.

Water-Plant

The present constitution of Illinois, adopted in 1870, is essentially a constitution of restrictions. It was framed by a convention made up for the most part of high-minded gentlemen, known as reformers in their day, whose main idea seemed to be to tie the hands of government and to prevent things being done. The proper development of Chicago has been greatly hampered by the restrictions imposed by this instrument. For one thing, the convention gave the justice court system of Chicago a status in the constitution, and

provided a complicated and indirect method of selecting justices—the main purpose of which was to remove control as far as possible from the people—which has been productive of very bad results. The justice courts of Chicago—the poor man's courts—have long been a travesty upon justice. In 1904 the constitution was amended so as to authorize the legislature to make special charter laws for the city of Chicago, on condition that no such law should become operative until approved by the people of the city. The first law adopted under this constitutional amendment was one abolishing the justice courts and establishing a municipal court system in their place. The new system went into operation in December, 1906. A semiofficial charter convention, created by resolution of the city council, has been framing a comprehensive new charter for the city of Chicago, which the legislature of 1907 will be asked to enact and submit to the people of Chicago for their approval or rejection. This charter is primarily a grant of broad home-rule powers, under which it is expected the city of Chicago will be able to work out its own problems without further interference in local matters from the state capital.

A feature of the constitution of 1870 which has not worked as its framers intended is the minority representation plan of electing members of the lower House of the General Assembly. Each legislative district sends three members to the House, and the constitution provides that a voter may cast one ballot for each of three candidates or cumulate his votes in any manner he sees fit. He may, if he so desires, cast three ballots for one candidate. The effect of this system in practical operation has been to limit the choice of electors on election day, and to make a nomination equivalent to an election, for the reason that the party organizations nominate only the number of candidates they expect to elect. In a district normally republican, for example, the Republican Party nominates two candidates for member of the legislature, and the Democrats only one. The result is that all three party nominees are practically certain to be elected, except in rare instances where an independent or a minor party candidate develops unusual strength. The working of this provision has been very disappointing, except to the professional organization politicians, and there is a strong demand for its abolition.

In 1906 the saloon license fee was raised from $500 to $1,000. Almost immediately thereafter an ordinance was passed limiting the number of saloons to one for every 500 of population. Chicago now has about 7,300 saloons, which is about one to every 300 of population. This means that no more saloon licenses can be issued for a number of years to come.

A few years ago the City Homes Association made a report on housing conditions, which was an important factor in bringing about a revision of the building code.

Chicago was one of the first cities in the country to adopt a thorough going civil-service law. The act in operation was passed by the legislature in 1895, and approved by the people on a referendum by a vote of about two to one. The civil-service principle is well supported by popular sentiment.

Among the bodies classed as reform organizations, the Municipal Voters' League has perhaps attracted most attention. The league was formed in 1896 to improve the personnel of the City Council, of whose sixty-eight members at that time not more than ten were believed to be honest. A great transformation has been wrought. The Chicago City Council to-day is looked upon as one of the best bodies of its kind in the country. For the past five years the council has been organized on non-partizan lines. More than five sevenths of the present members were elected with the indorsement of the Municipal Voters' League. The league does not make nominations, but it investigates and issues to the voters reports and recommendations upon the various candidates for aldermen. In January, 1906, a conference was held in Chicago, at the call of the Municipal Voters' League, of the so-called militant civic organizations of the United States. Sixteen cities were represented. The conference by unanimous vote adopted the following recommendations:

Municipal Voters' League

First.—That cities should be granted the largest possible measure of home rule, subject only to such general statutory safeguards and restrictions as may be necessary to protect the general interests of the state as distinguished from the local interests of the municipality.

Second.—That the party column on the ballot should be abolished; that the names of candidates for a single office should be printed on the ballot under the designation of that office, and that it should be made impossible to vote a straight party ticket by a single mark or cross.

Third.—That municipal nominations and elections should be completely separated from state and national nominations and elections and should occur at different times, and that nominations for all municipal offices be made by petition or by an efficient method of direct primaries.

Fourth.—That the number of elective municipal officers should be reduced as far as practicable, always preserving the right to elect members of the municipal legislative body or city council.

Fifth.—That the merit principle should be applied to all departments of city administration under practical and efficient civil-service laws.

Within the past few years there have been created in the south division of Chicago fourteen new parks that are notable for their equipment. The parks themselves are of varying areas, but all contain buildings constructed on substantially similar plans. Each building contains a gymnasium for men and another for women. Bathing facilities are abundant, and in some cases outdoor swimming pools are provided. Each building has a large assembly hall and several smaller rooms for club and social purposes. The aim is to make the building a neighborhood center. The use of the rooms may be had without cost for meetings or social purposes. Each building has a reading-room, and the park management conducts in each a restaurant in which refreshments are served at moderate prices. About most of the buildings are wading pools, sand piles, and other special accommodations for children. Some outdoor gymnastic apparatus is provided, as well as playground facilities. The office of the South Park Commission which has installed these new parks is at Fifty-seventh Street and Cottage Grove Avenue.

Chicago has a large number of social settlements, the best known being the following: *Hull House*—Miss Jane Addams, founder and head; *Chicago Commons*—Prof. Graham Taylor, founder and head; *University of Chicago Settlement*—Miss Mary McDowell, head.

Addresses of institutions, societies, and social settlements in Chicago:

Municipal Voters' League, 228 South Clark Street.
Legislative Voters' League, 92 La Salle Street.
Chicago Bureau of Charities, 79 Dearborn Street.

Civic Federation, 184 La Salle Street.
Citizens' Association, 92 La Salle Street.
City Club of Chicago, 228 South Clark Street.
Chicago Federation of Labor, 277 La Salle Street.
City Homes Association, 1001 Monadnock Block.
Socialist Headquarters, 163 East Randolph Street.
Hull House, 335 South Halstead Street.
Chicago Commons, 180 Grand Avenue.
University of Chicago Settlement, 4630 Gross Avenue.

GEORGE C. SIKES.

CHICAGO ANARCHISTS, THE: The arrest, trial, and execution of the so-called "Chicago anarchists" mark an epoch in the development of the labor movement in America. The facts of the case, gathered out of the somewhat contradictory statements made by those who believe that the anarchists were rightly and those who believe that they were wrongly condemned seem to be as follows:

The year 1886 was one of wide-spread social industrial agitation in the United States. In 1884 the Federation of Trades and Labor Unions of the U. S. and Canada had issued a manifesto calling on all trades to unite in the demand for an eight-hour day, and setting a day for a general strike to gain that end. May 1, 1886, was the day appointed when the new system should be inaugurated.

History

In Chicago the excitement ran the highest. Here was a little group of men more or less loosely banded together, and popularly called anarchists. As a matter of fact, they were of various economic views. They gathered around a section of the American International, which had become an anarchistic organization, and must not be confused with the old European Socialist International. They had two principal organs: the *Alarm*, with Parsons as its editor; the English organ, and the *Arbeiter Zeitung*, the German organ, with Spies and Schwab as its principal writers, and Fischer as foreman. Fielden and Engel were also prominent in the group. Not agreed in their economic views, they were agreed in denouncing the present system as the parent of cruel wrongs, and in being willing to go to extremes in agitating against this system.

They felt that the labor movement was dying of inertia. They felt that the working people were being utterly ground down, and submitting too easily. They thought that, without really committing violence, if they threatened violence and "talked" murder and dynamite, they could frighten the capitalists into either valuable concessions, or such a policy of restriction as would make the people rise. They therefore began in the *Alarm* to write incendiary articles; and in order to frighten the capitalists, they reported the working people as preparing to rise in vengeance. Some of them, at least, believed that by "talking violence" they would "really prevent violence." They argued that "if it did cost a little bloodshed now," it would "save bloodshed in the end." Some of them were themselves the gentlest of men.

The eight-hour movement gave the anarchists opportunity for agitation. An eight-hour association was formed in Chicago. Open-air meetings were continually held. Bitterest language was used. On their side, the employers drew closer together against the movement. Some firms, however granted some reduction of hours. At McCormick's reaper works there was a prolonged struggle, commencing in February and continuing many months. Twelve hundred men were thrown out of work. On May 1, 40,000 men and women struck in Chicago for the eight-hour day. The Central Labor Union of Chicago held a mass-meeting attended by 25,000 people. Spies, Parsons, Fielden, and Schwab spoke. On May 2d a great meeting of the locked-out men from McCormick's was held to protest against the Pinkertons he employed.

Parsons and Schwab spoke at the meeting. Among the strikers were the lumber-shovers, most of them Poles, Bohemians, and Germans. May 3d, the Lumber-Shovers' Union called a meeting to discuss the terms of proposals to be submitted to their employers.

The Strike

The meeting was held near McCormick's. Spies, being known as a good speaker, was invited to attend. When he appeared, a protest was heard against letting a Socialist speak. But Spies began, and was soon listened to in quiet. At four o'clock the bell of McCormick's began to ring, and the "scabs" were seen leaving. Some of the bystanders at the meeting then made a move toward the factory, while Spies went on quietly with his speech for another fifteen minutes. The crowd outside the factory began throwing stones. The police were telephoned for, and arrived in large numbers. They were received with stones, and replied with their revolvers. A few shots were returned by the crowd, and the police opened a general fire upon all in sight—men, women, and children, who fled in terror, leaving four dead and many wounded. Burning with indignation, Spies rushed back to the *Arbeiter Zeitung* office and wrote a manifesto, the so-called "Revenge Circular." This was distributed at the different workmen's meeting-places.

Among the many meetings that took place the same night was one of the Socialist association, the Lehr und Wehr Verein. Gottfried Waller, who turned informer afterward, was elected chairman. Engel and Fischer were present. The events of the afternoon at McCormick's were discussed. It was resolved to call a meeting the following night in the Haymarket to protest against the police assaults. Fischer informed Spies, at the *Arbeiter Zeitung* office, of the proposed meeting and asked him to speak; he consented. Shortly afterward he saw, for the first time, the circular calling the meeting, which contained the words, "Working men, arm yourselves, and appear in full force." Immediately on reading the circular Spies said that this must be struck out, or he would not speak or attend the meeting. Fischer at once agreed, and had the line taken out. The circular with that line omitted was printed, and about 20,000 copies distributed.

Parsons had been away from Chicago to Cincinnati, from Sunday, May 2d, and returned Tuesday morning. His wife asked him to help her in organization of the sewing girls of Chicago, and Parsons, knowing nothing of the Haymarket meeting, called a meeting of the American group at the *Arbeiter Zeitung* office. In the evening Spies went to the Haymarket, but seeing no English speakers, went away, with a few friends, to find Parsons; but soon returned, without having found him, and opened the meeting.

Meantime, a few members of the American group had assembled at the *Arbeiter Zeitung* building. There were Fielden, Schwab, and at about 8.30 o'clock Parsons arrived, in company with Mrs. Parsons, his two children, and Mrs. Holmes. Schwab soon left to address a meeting at Deering. Schwab stayed at Deering until 10.30 o'clock. The discussion on the girls' movement was soon over, when somebody arrived from the Haymarket, stating that English speakers were wanted. Parsons, with his company, Fielden, and most of those present, at once went there. On their arrival Spies ceased speaking, and Parsons got up and spoke about one hour. The meeting was a quiet one, and at the close of Parsons's speech, the Mayor of Chicago, who attended the meeting for the purpose of dispersing it, if need should arise, left the meeting, and went over to the police station, and told Captain Bonfield that he had better issue orders to his reserves at the other stations to go home. Parsons was followed by Fielden. When he had been speaking some ten minutes the weather clouded, and the wind blowing cold, Parsons suggested that they adjourn to Zepf's Hall; Fielden said he would be through in a few minutes. Many, among them Parsons, with his family, crossed to Zepf's Hall, where they found Fischer. Fielden went on speaking, when suddenly about 180 police turned out of the station, marching with a quick step, in fighting formation, and with arms in readiness, to the Haymarket, where only a few hundred persons remained. The captain of the first row of the police had just ordered the meeting to disperse, and his men, without waiting a reply, were advancing to the attack, when a small bomb was thrown by some one, alighted between the first and second companies of the police, and exploded with a loud report. About sixty of the police were thrown to the ground, and one, named Matthias J. Degan, was killed. Instantly firing began; people fled in all directions, followed by the police, who fired at random as they followed.

The Riot

The Haymarket speakers, except Parsons, who had left Chicago, were arrested; those who had taken a prominent part in labor meetings, and were known as labor organizers, were hunted and imprisoned. The *Arbeiter Zeitung* was suppressed, and all its printers and editors put in jail. When the friends of the arrested men tried to restart it, it had to pass under the censorship of the chief of police. The meetings of workmen were prohibited or broken up. The most exciting tales about infernal conspiracies against the life and property of the citizens were circulated. The daily papers called for the hanging of the leading anarchists, as if they had been already proved guilty.

After the Haymarket meeting, May 4, 1886, some 300 leading American capitalists met secretly to plan the destruction of anarchy. They formed themselves into The Citizens' Association, and subscribed $100,000 in a few hours.

On May 17th the grand jury came together. "The body is a strong one," says a telegram from Chicago to a New York daily, "and it is safe to aver that anarchy and murder will not receive much quarter at the hands of the men composing it. It is certain that Spies, Parsons, Schwab, and the other inciters to outrage will be indicted." Indicted they were. The indictment contained sixty-nine counts, charging the defendants, Spies, Schwab, Fielden, Parsons, Fischer, Engel, Lingg, Neebe, Schnaubelt, and Seliger with the murder of M. J. Degan. Schnaubelt and Parsons were not in the hands of the police, but when the trial came on Parsons presented himself at the bar of the court. Seliger had turned informer. On June 21st the impaneling of the jury before Judge Joseph E. Gary began. About 1,000 were examined. Of this number only five or six belonged to the labor class, and they were all challenged and refused by the state. The remainder were all employers of labor, or men de-

The Trial

pendent upon that class, as clerks or the like. Most declared they had a prejudice against anarchists, socialists, and communists as a class. This, however, Judge Gary ruled, was no cause to exclude them from the jury. On the motion for a new trial, an affidavit was produced wherein it was sworn that the special bailiff, Henry Ryce, had said to well-known men in Chicago that he was managing this case, and well knew what he was about; that those fellows would hang as certain as death, and that he was only summoning such men as jurors as would not be acceptable to the defendants.

The most important witnesses for the state were Waller, Schrader, and Seliger, all formerly comrades of the defendants, now turned informers. The theory for the prosecution was that the defendants were, with others, actively engaged in a conspiracy to overturn the existing authorities, and advocated bloodshed and violence in order to gain their ends, and that the meeting on May 4th in the Haymarket was only one step in their program. The evidence brought forward to support such a theory was, however, extremely contradictory, and much of it broke down completely on the first examination. It was never proved who threw the bomb, and, as some of the men indicted were not at the Haymarket meeting, and had nothing to do with it, the prosecution was forced to proceed on the theory that the men indicted were guilty of murder because they had at various times in the past uttered and printed incendiary and seditious language, practically advising the killing of policemen, of Pinkerton men, and others.

Said Judge Gary:

"If the fact be that a large number of men concurred with each other in preparing to use force for the destruction of human life, upon occasions which were not yet foreseen, but upon some principles which they substantially agreed upon, as, for example, taking the words of this witness, if a large number of men agreed together to kill the police if they were found in conflict with the strikers—I believe that is the phrase—leaving it to the agents of violence to determine whether the time and occasion had come for the use of violence; then, if the time and occasion do come when the violence is used, are not all parties who agreed beforehand in preparing the means of death, and agreed in the use of them upon time and occasion, equally liable?"

The Prosecution

The prisoners argued that, as some unknown persons threw the bomb, it was impossible to know beyond a reasonable doubt that he had been led to do it by any public speech of theirs or any editorial they had published. They also claimed that to punish them because of the effect of any public speech they had delivered or any newspaper article they had written or published would be a violation of the law that forbids any abridgment of speech or press in the U. S. The prisoners had counsel, but also defended themselves in speeches rather of defiance than defense.

After a prolonged trial the jury brought in the verdict:

"We, the jury, find the defendants August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, George Engel, and Louis Lingg guilty of murder in manner and form as charged in the indictment, and fix the penalty at death. We find the defendant Oscar W. Neebe guilty of murder in manner and form as charged in the indictment, and fix the penalty at imprisonment in the penitentiary for fifteen years."

The Verdict

The case was carried to the Supreme Court, and was there affirmed in the fall of 1887. November 10th Lingg committed suicide by exploding a bomb in his mouth. The sentence of Fielden and Schwab was commuted to imprisonment for life, and Parsons, Fischer, Engel, and Spies were hanged Nov. 11, 1887. They suffered calmly and without flinching. Parsons's last words were, "Let the voice of the people be heard."

The hanging excited great agitation over the world. The major part of the daily press and of the capitalist community welcomed it as a necessary stamping out of anarchy in this country. On the other hand, many thoughtful men, including judges, lawyers, clergymen, and others, while expressing dissent from all sympathy with anarchists, declared their belief that the trial had not been a fair one. By the world of labor the anarchists were lauded as martyrs to the cause of labor and of liberty, and their trial and hanging denounced as an outrage upon justice and upon freedom. Mrs. Parsons went through the land lecturing to crowded audiences. Anarchism was made almost popular among many classes. Anarchists and the more radical Socialists and labor reformers of all schools of thought, who will unite on no other occasion, have met on both sides of the Atlantic to commemorate the hanging of "the Chicago martyrs."

In June, 1893, the recently elected Democratic Governor of Illinois, John P. Altgeld, having thoroughly examined the evidence, pardoned Neebe, Fielden, and Schwab, on the ground that they had not been fairly tried.

We give a synopsis of Governor Altgeld's published argument for believing the trial not to have been a fair one, and then a synopsis of Judge Gary's statement upon the other side.

Says Governor Altgeld in substance:

The record of the trial shows that the jury in this case was not drawn in the manner that juries usually are drawn; that is, instead of having a number of names drawn out of a box that contained many hundred names, as the law contemplates shall be done in order to insure a fair jury and give neither side the advantage, the trial judge appointed one, Henry L. Ryce, as a special bailiff to go out and summon such men as he, Ryce, might select to act as jurors. While this practise has been sustained in cases in which it did not appear that either side had been prejudiced thereby, it is always a dangerous practise, for it gives the bailiff absolute power to select a jury that will be favorable to one side or the other.

Gov. Altgeld's Statement

While no collusion is proved between the judge and state's attorney, it is clearly shown that after the verdict, and while a motion for a new trial was pending, a charge was filed in court that Ryce had packed the jury and that the attorney for the state got Mr. Favor to refuse to make an affidavit bearing on this point, which the defendants could use, and then the court refused to take any notice of it unless the affidavit was obtained, altho it was informed that Mr. Favor would not make an affidavit, but stood ready to come into court and make a full statement if the court desired him to do so.

These facts alone would call for executive interference, especially as Mr. Favor's affidavit was not before the Supreme Court at the time it considered the case.

The second point urged seems to me to be equally conclusive. In the case of the People vs. Couglin, known as the Cronin case, recently decided, the Supreme Court, in a remarkably able and comprehensive review of the law on this subject, says among other things:

"The holding of this and other courts is substantially uniform, that where it is once clearly shown that there exists in the mind of the juror at the time he is called to the jury box a fixt and positive opinion as to the merits of the case, or as to the guilt or innocence of the defendant he is called to try, his statement that, notwithstanding such opinion, he can render a fair and impartial verdict according to the law and evidence, has little, if any, tendency to establish his impartiality."

Applying the law as here laid down in the Cronin case to the answers of the jurors above given in the present case, it is very apparent that most of the jurors were incompetent, because they were not impartial, for nearly all of them candidly stated that they were prejudiced against the defendants, and believed them guilty before hearing the evidence; and the mere fact that the judge succeeded by a singularly suggestive examination in getting them to state that they believed they could try the case fairly on the evidence did not make them competent. . . .

No matter what the defendants were charged with, they were entitled to a fair trial, and no greater danger could possibly threaten our institutions than to have the courts of justice run wild or give way to popular clamor; and when the trial judge in this case ruled that a relative of one of the men who was killed was a competent juror, and this after the man had candidly stated that he was deeply prejudiced and that his relationship caused him to feel more strongly than he otherwise might, and when in scores of instances he ruled that men who candidly declared that they believed the defendants to be guilty; that this was a deep conviction and would influence their verdict, and that it would require strong evidence to convince them that the defendants were innocent, when in all these instances the trial judge ruled that these men were competent jurors simply because they had, under his adroit manipulation, been led to say that they *believed* they could try the case fairly on the evidence, then the proceedings lost all semblance of a fair trial.

Does the Proof show Guilt?

The state has never discovered who it was that threw the bomb which killed the policeman, and the evidence does not show any connection whatever between the defendants and the man who did throw it. The trial judge in overruling the motion for a new hearing, and again, recently, in a magazine article, used this language:

"The conviction has not gone on the ground that they did have actually any personal participation in the particular act which caused the death of Degan, but the conviction proceeds upon the ground that they had generally by speech and print advised large classes of the people, not particular individuals, but large classes, to commit murder, and had left

the commission, the time and place and when to the individual will and whim, or caprice, or whatever it may be, of each individual man who listened to their advice, and that in consequence of that advice, in pursuance of that advice and influenced by that advice, somebody not known did throw the bomb that caused Degan's death. Now, if this is not a correct principle of the law, then the defendants of course are entitled to a new trial. This case is without precedent; there is no example in the law books of a case of this sort."

The judge certainly told the truth when he stated that this case was without a precedent, and that no example could be found in the law books to sustain the law as above laid down. For, in all the centuries during which government has been maintained among men and crime has been punished, no judge in a civilized country has ever laid down such a rule before. The petitioners claim that it was laid down in this case simply because the prosecution, not having discovered the real criminal, would otherwise not have been able to convict anybody; that this course was then taken to appease the fury of the public, and that the judgment was allowed to stand for the same reason. I will not discuss this. But taking the law as above laid down, it was necessary under it to prove, and that beyond a reasonable doubt, that the person committing the violent deed had at least heard or read the advice given to masses, for until he either heard or read it he did not receive it, and if he did not receive it, he did not commit the violent act in pursuance of that advice, and it is here that the case for the state fails; with all his apparent eagerness to force conviction in court, and his efforts in defending his course since the trial, the judge, speaking on this point in his magazine article, makes this statement: "It is probably true that Rudolph Schnaubelt threw the bomb," which statement is a mere surmise and is all that is known about it, and is certainly not sufficient to convict eight men on. In fact, until the state proves from whose hands the bomb came, it is impossible to show any connection between the man who threw it and these defendants. . . .

Again it is shown that various attempts were made to bring to justice the men who wore the uniform of the law while violating it, but all to no avail; that the laboring people found the prisons always open to receive them, but the courts of justice were practically closed to them; that the prosecution officers vied with each other in hunting them down, but were deaf to their appeals; that in the spring of 1886 there were more labor disturbances in the city, and particularly at the McCormick factory; that under the leadership of Captain Bonfield the brutalities of the previous years were even exceeded.

Was it Personal Revenge?

While some men may tamely submit to being clubbed and seeing their brothers shot down, there are some who will resent it, and will nurture a spirit of hatred and seek revenge for themselves, and the occurrences that preceded the Haymarket tragedy indicate that the bomb was thrown by some one who, instead of acting on the advice of anybody, was simply seeking personal revenge for having been clubbed, and that Captain Bonfield is the man who is really responsible for the death of the police officers.

It is also shown that the character of the Haymarket meeting sustains this view. The evidence shows there were only 800 to 1,000 people present, and that it was a peaceable and orderly meeting; that the mayor of the city was present, and saw nothing out of the way, and that he remained until the crowd began to disperse, the meeting being practically over, and the crowd engaged in dispersing when he left; that had the police remained away for twenty minutes more there would have been nobody left there, but that as soon as Bonfield learned that the mayor had left, he could not resist the temptation to have some more people clubbed, and went up with a detachment of police to disperse the meeting, and that on the appearance of the police the bomb was thrown by some unknown person, and several innocent and faithful officers, who were simply obeying an uncalled-for order of their superior, were killed. All of these facts tend to show the improbability of the theory of the prosecution that the bomb was thrown as the result of a conspiracy on the part of the defendants to commit murder. If the theory of the prosecution were correct, there would have been many bombs thrown; and the fact that only one was thrown shows that it was an act of personal revenge.

It is further shown here that much of the evidence given at the trial was a pure fabrication. In addition to the evidence in the record of some witnesses who swore that they had been paid small sums of money, etc., several documents are here referred to.

First, an interview with Captain Ebersold, published in the Chicago *Daily News*, May, 10, 1889.

The Chief of Police's Statement

Ebersold was chief of the police of Chicago at the time of the Haymarket trouble, and for a long time before and thereafter, so that he was in a position to know what was going on, and his utterances upon this point are therefore important. Among other things he says: "It was my policy to quiet matters down as soon as possible after May 4th. The general unsettled state of things was an injury to Chicago. On the other hand, Captain Schaack wanted to keep things stirring. He wanted bombs to be found here, there, all around, everywhere. I thought people would lie down and sleep better if they were not afraid that their homes would be blown to pieces any minute. But this man Schaack, this little boy who must have glory or his heart would be broken, wanted none of that policy. Now, here is something the public does not know. After we got the anarchist societies broken up, Schaack wanted to send out men to again organize new societies right away. You see what this would do. He wanted to keep the thing boiling, keep himself prominent before the public. Well, I sat down on that, I didn't believe in such work, and of course Schaack didn't like it.

"After I heard all that I began to think there was perhaps not so much to all this anarchist business as they claimed, and I believe I was right. Schaack thinks he knew all about those anarchists. Why, I knew more at that time than he knows to-day about them. I was following them closely. As soon as Schaack began to get some notoriety, however, he was spoiled."

This is a most important statement. When a chief of police, who has been watching the anarchists closely, says that he was convinced that there was not so much in all this anarchist business as was claimed, and that a police captain wanted to send out men to have other conspiracies formed in order to get the credit of discovering them and keeping the public excited, it throws a flood of light on the whole situation, and destroys the force of much of the testimony introduced at the trial.

It is further charged with much bitterness by those who speak for the prisoners that the record of the case shows that the judge conducted the trial with malicious ferocity; that every ruling throughout the long trial on any contested point was in favor of the state; and, further, that page after page of the record contains insinuating remarks of the judge, made in the hearing of the jury, and with the evident intent of bringing the jury to his way of thinking; that these speeches, coming from the court, were much more damaging than any speeches from the state's attorney could possibly have been; that the state's attorney often took his cue from the judge's remarks; that the judge's magazine article, recently published, altho written nearly six years after the trial, is yet full of venom; that, pretending to simply review the case, he had to drag into his article a letter written by an excited woman to a newspaper after the trial was over, and which therefore had nothing whatever to do with the case, and that, not content with this, he in the same article makes an insinuating attack on one of the lawyers for the defense, not for anything done at the trial, but because more than a year after the trial, when some of the defendants had been hung, he ventured to express a few kind, if erroneous, sentiments over the graves of his dead clients, whom he at least believed to be innocent. It is urged that such ferocity or subserviency is without a parallel in all history; that even Jeffreys in England contented himself with hanging his victims, and did not stoop to berate them after they were dead.

Prejudice or Subserviency of Judge

These charges are of a personal character, and while they seem to be sustained by the record of the trial and the papers before me, and tend to show that the trial was not fair, I do not care to discuss this feature of the case any further, because it is not necessary. I am convinced that it is clearly my duty to act in this case for the reasons already given, and I, therefore, grant an absolute pardon to Samuel Fielden, Oscar Neebe, and Michael Schwab, on this 26th day of June, 1893.

JOHN P. ALTGELD,
Governor of Illinois.

In *The Century Magazine* for April, 1893, Judge Gary gives, in a 30-page article, a defense of the verdict.

Judge Gary's statement in substance is this:

Mr. Gary reviews the events and scenes of the trial in detail, stating his motives to be a justification of the verdict and an effort to prove that the anarchists did not represent the laboring classes, but simply made a show of friendship to the latter in order to bring them into their own ranks. He asserts that the seven men sentenced to death were beyond all cavil guilty of murder, and that it would have been a great misfortune if society had not maintained its right to defend itself. The most noted legal authorities are adduced to show that the men who argued on every occasion for anarchy and destruction, in their press and through their orators, and who "incited, advised, encouraged the throwing of the bomb that killed the policemen," were clearly within the condemnation of the law. To further support this, facsimile and other long extracts are given from the more rabid anarchistic press, and pictures appear of the bombs and apparatus of the desperate men.

Mr. Gary shows carefully and fairly the evidence which led to the conviction of the ringleaders, and takes the ground that they were sentenced not because they were anarchists, but because they were parties to murder.

On page 835 the judge says: "The conviction proceeded upon the ground that they had generally, by speech and print, advised large classes to commit murder; and had left the com-

mission, the time and place, and when to the individual will and whim or caprice, or whatever it may be, of each individual man who listened to their advice; and in consequence of that advice, in pursuance of that advice, and influenced by that advice, somebody, not known, did throw the bomb that caused Degan's death."

On pages 830 and 831 the judge says: "It is probably true that Rudolph Schnaubelt threw the bomb. He was twice arrested; but, having shaved off a full beard immediately after that fatal night, was discharged. After the second arrest he disappeared and has gone to parts unknown. But whether Schnaubelt or some other person threw the bomb is not an important question."

The case is the more remarkable because it was not claimed that either of the prisoners threw the bomb or gave any person any secret advice to throw it. The case proceeded on the ground that the prisoners gave all their advice from public platforms and in the columns of newspapers. On page 830 the judge says: "Secrecy is not essential to a conspiracy."

On page 812 the judge says: "They incited, advised, encouraged the throwing of the bomb that killed the policeman not by addressing the bomb-thrower specially, and telling him to throw a bomb at that or any special time or occasion, but by general addresses to readers and hearers."

On the same page he also says: "The sincerity of the anarchists in their belief of the benefits to accrue from anarchy (if they were sincere) is not to be considered when the question is whether they were murderers."

On page 812 the judge says that "every reader (of the anarchist papers), following the advice to arm himself, would —must—understand that he must exercise his own discretion in using his weapons."

He concludes: "For nearly seven years the clamor, uncontradicted, has gone round the world that the anarchists were heroes and martyrs, victims of prejudice and fear. Not a dozen persons alive were prepared by familiarity with the details of their crime and trial, and present knowledge of the materials from which those details could be shown, to present a succinct account of them to the public. It so happened that my position was such that from me that account would probably attract as much attention as it would from any other source. Right-minded, thoughtful people, who recognize the necessity to civilization of the existence and enforcement of laws for the protection of human life, and who yet may have had misgivings as to the fate of the anarchists, will, I trust, read what I have written, and dismiss those misgivings, convinced that in law and in morals the anarchists were rightly punished, not for opinions, but for horrible deeds."

The main sources of evidence for the facts are, of course, the official records of the court. A history of the trial has been written by Dyer D. Lum, and the speeches of the anarchists in court have been printed many times in pamphlet form. For a brief notice of the condemned, see the first edition of this encyclopedia.

CHILD, LYDIA MARIA (*née* **FRANCIS**): American champion of antislavery; writer; born in Medford, Mass., 1802. Attended the common schools, and studied with her brother, Rev. Convers Francis, D.D. Until her marriage, in 1828, she taught in Medford and Watertown, Mass; and in 1826 she began the publication of the *Juvenile Miscellany*, the first monthly periodical for children issued in the United States.

In 1831 both Mr. and Mrs. Child became deeply interested in the subject of slavery. Mrs. Child's "Appeal for that Class of Americans called African" (Boston, 1833) was the first antislavery work published in America in book form, and was followed by several smaller works on the same subject. Mrs. Child had to endure social ostracism, but from this time was a steady champion of antislavery. On the establishment of the *National Antislavery Standard*, in New York City, in 1840, she became its editor and conducted it till 1843, when her husband took the place of editor-in-chief, and she acted as his assistant till May, 1844. In 1859, she wrote a letter of sympathy to John Brown, then a prisoner at Harper's Ferry, offering her services as a nurse, and enclosing the letter in one to Governor Wise. Brown replied, declining her offer, but asking her to aid his family, which she did. She also received a letter of courteous rebuke from Governor Wise, and a singular epistle from the wife of Senator Mason, author of the Fugitive Slave Law, threatening her with future damnation. She replied to both in her best vein, and the whole series of letters was published in pamphlet form (Boston, 1860), and had a circulation of 300,000. She also wrote two small tracts on the "Fugitive Slave Law" and "Emancipation in the British West Indies." During her latter years she contributed freely to aid the national soldiers in the Civil War, and afterward to help the freedmen. She died in 1880.

Mrs. Child's works are voluminous and treat of a great variety of subjects. Besides those already mentioned are the following: "The Rebels, or Boston before the Revolution"; "The American Frugal Housewife" (1829); "The Family Nurse," or companion of "The Frugal Housewife"; "The Mother's Book" and "The Girl's Own Book" (1831); "History of Woman" (1835); "Biographies of Good Wives" (1833); "The Oasis" (1834); "The Anti-Slavery Catechism" (1836); "Authentic Narratives of American Slavery" (1838); "The Evils of Slavery and the Cure of Slavery" (1836); "Philothea: A Grecian Romance" (1845); "Letters from New York" (2 vols., 1843–44); "Fact and Fiction" (1846); "Flowers for Children" (1852); "Isaac T. Hopper: a True Life" (1853); "The Progress of Religious Ideas through Successive Ages" (3 vols., 1855); "Autumnal Leaves: Sketches in Prose and Rhyme" (1857); "Looking toward Sunset" (1864); "The Freedman's Book" (1865); and "The Romance of the Republic" (1867).

CHILD HELPING: Classification is the first condition of rational study and treatment of this social task. Normal children in normal homes are not here considered; their education is entrusted to the general forces which make for progress. The exceptional child becomes the subject of special philanthropic attention. The primary classification is made on the basis of physical and psychic condition: (1) The normal in body and mind; (2) the defective in sight or hearing; (3) the lame, deformed, feeble, and slow who are educable; (4) the abnormal, feeble-minded, idiotic, imbecile, epileptic, and insane who are educable only within narrow limits, and who all require close supervision; (5) the vicious, depraved, and delinquent. Subclasses are formed by consideration of age, stage of development, sex, and domestic situation.

Observation under friendly detention is the first stage of social dealing with neglected or delinquent children; it is like the physician's diagnosis which precedes prescription of medicine or hygienic direction. The attempt to make a census of all defective and abnormal children has not been successful; the ordinary census canvassers are not competent to make the diagnosis. A more satisfactory result has been secured by the study of pupils in schools, and making a record of the defective and abnormal, as in Switzerland. Institutions and temporary homes for the care of foundlings, abandoned and abused children, orphans and half-orphans frequently have quarters for quarantine and observation. Thus, the École Théophile Roussel at Montesson, near Paris, and the Asile d'Observation in the shelter of the Assistance Publique in Paris (rue Denfert-Rochereau) furnish examples. Uniform records and reports to central authority are desirable. Our juvenile courts and certain societies for preventing cruelty have medical inspection and useful records of history and condition. On the basis of classification made through observation, certain principles of treatment have been applied as the result of experience and discussion.

Social care begins with prevention. The measures taken indicate the existing evils and dangers, and show also the guiding ideas of practical men.

Associations and governments have begun to ameliorate the conditions of existence; to improve the external and internal sanitary condition of the house; to enact and administer truancy laws to keep children in school, and factory laws to keep them out of unsuitable industries and save them from premature industrial exploitation; to provide baths and medical care, ice, and pure milk; to wage war on tuberculosis and other communicable and preventable diseases; to improve and extend educational agencies and adapt them to the industrial needs of working people; to provide insurance so that families may not be impoverished or pauperized in time of sickness, accident, or death. More direct methods are such as dispensaries for training mothers in the care of infants, as those of Dr. Budin in Paris; the provision of Pasteurized and sterilized milk, gratuitously or at low cost; and charitable supply of food and clothing for school pupils whose parents are too poor to supply their wants. Judicial intervention has, in recent years, been vastly extended and improved, as in the educational measures for neglected children in Germany since 1900, the councils of tutelage in Norway and Holland, the Children's Courts in the United States. and similar activity of judges in France and Austria. This judicial intervention becomes the center of the philanthropic activities of associations, probation officers, institutions, and industrial schools. Defective parental influence is improved, and when it becomes incurably vicious it is removed. One statement of the principle is this: "If it can be done without sacrificing the interests of the child, he should remain with his own parents, who should be stimulated and helped to meet their parental obligations, as far as possible. Every reasonable effort should be made to repair breaches and defects in the home before breaking up the family relation." (N. C. C., 1906, Report of Committee on Child Saving.)

The mother who refuses natural nourishment and physical care greatly increases the probability of her infant's death. The unmarried mother should be offered help to care for her offspring; and the father, when possible, should be sought out and required to carry his share of the burden of support. If the infant has been separated from the mother by reason of her death or flight, the best chance of life is the breast milk of some other mother; and next to that, at a long distance, the prepared milk or artificial foods recommended by physicians. Infants should not be kept together in large numbers, for they infect each other with disease; but they should be scattered in selected homes which are kept under supervision. When the first months of infancy are safely passed, the homeless child is to be cared for on the principles stated in the following paragraphs:

Half-orphans, children of parents in hospitals and asylums, and of others temporarily unable to support them, may properly be boarded out in families or kept for some weeks in institutions, the parents paying for the cost as far as they are able. Permanently dependent children, as orphans, children taken by legal process from cruel or immoral parents should not be retained in institutions longer than is necessary to observe them, prepare them physically and otherwise for family life, and find them suitable family homes. Temporary homes should be prevented by state law and inspection from becoming asylums. The natural place for a normal child is in a good family. The foster home must be selected, examined, and supervised for a time by trained agents of a responsible society approved by state authority. Inquiry by letters is entirely inadequate protection. Supervision should not be discontinued except upon authority of a court of record. The cost of board and education may be met by a charitable society, or by families taking such children for care or adopting them outright. All acts of charitable associations should be under judicial and state control.

The special methods of education suitable for deaf, blind, crippled, and deformed children are considered in pedagogic science. Social responsibility centers in modes of placing and support. Generally the states provide boarding-schools for the instruction of the blind and deaf, and these are supported partly or entirely at public cost. In large cities experiments are being made with special rooms and teachers for defective children. Crippled children require orthopedic treatment and special hospital care.

When observation has shown that a child is so imperfectly developed mentally as to be incapable of training for competitive life and self-control, the only course open is segregation in special schools which gradually become asylums for life. Such persons never become fit for marriage and parenthood, and by segregation in colonies, which may be made in great part self-supporting, society is protected against the propagation of the unfit. Epileptic children, when the disease is marked and seated, require treatment and life-long asylum in their own colonies, apart from the insane and the feeble-minded. The modes of treatment in such colonies are subjects of surgical, medical, and pedagogic science.

Neglected and dependent children are exposed to moral peril, and are tempted to satisfy wants by means harmful to society. The judicial intervention already mentioned represents the modern tendency in all civilized countries to place young persons under responsible discipline before evil habits have become fixt and have issued in depravity and crime. Only when family, school, probation officers, and church have failed, is there recourse to the institution. Reformatory education begins with ungraded rooms under special teachers and methods; proceeds to parental schools where temporary discipline seeks to restore the delinquent to the ordinary schools; and then follow, for more difficult cases, the industrial or reform school with its farm and trades, and later still the reformatory and the prison. Incarceration must be the last resort. In all institutions outdoor life, with rural occupations, seems the most hopeful environment. (See REFORMATORY.)

Most of the agencies of child-helping have sprung into existence through the initiative of individuals, and only slowly has general organization been effected. In each city and county there is need of local cooperation in order to prevent duplication and waste of means and effort, to avoid neglect of need, and to sustain general interest. Public institutions should be visited and encouraged. The center for local cooperation may be the associated charities, a society for protecting children, a juvenile court association, a board of guardians, or a committee created by all the agencies which are seeking to help children in the community.

By central organization is here meant that of the state. Each commonwealth ought to have a

board of charities and correction which can supervise all agencies and activities in this field and propose laws and regulations for the furtherance of sound methods and the prevention of abuses. An important aid to this central organization is the State Convention of Charity and Correction which is held annually in some states.

The chief educational organization is the National Conference of Charities and Correction, whose proceedings, as printed, are a mine of information on all phases of this subject. The National Children's Home Society is a federation of state societies, twenty-eight in number, which holds two meetings annually, and strives, through its executive committee and superintendents, to extend the organization in territory not yet properly organized, and to improve the character of the work already attempted. The oldest of these societies, and the mother of all, has recently (1906) joined the federation. This is the New York Children's Aid Society, founded by the distinguished philanthropist, Mr. Charles Loring Brace. The National Child Labor Committee, organized in 1904, has for its object the education of the public in relation to the extent and effects of injurious employment of children, and the promotion of legislative and administrative methods of diminishing the evils connected with industrial exploitation of young persons.

CHILD LABOR (see also Child Saving, Child Labor in England, National Child Labor Committee): United States.

Bulletin 69, Department of Commerce and Labor, Bureau of the Census (Washington, D. C., Jan., 1907), gives the following table of the extent of Child Labor in the United States in 1900:

TABLE I

Children Ten to Fifteen Years of Age Reported at the Twelfth Census as Having a Gainful Occupation

United States (area of enumeration)	1,752,187		
Continental United States	1,750,178	Hawaii	998
Alaska	1,002	Military and naval service abroad	9

A classification by year of age is also given for the following reason: "In the age period ten to fifteen occurs the transition from childhood to adolescence, and normally each year included in that period marks important changes in the child's growth and development; hence in any question relating to the education and welfare of the child, a difference of only one year is significant" (p. 7).

TABLE II

Breadwinners Ten to Fifteen Years of Age in Continental United States, 1900

Age	Number	Per cent
10 years	142,105	8.1
11 years	158,778	9.1
12 years	221,313	12.6
13 years	268,427	15.3
14 years	406,701	23.2
15 years	552,854	31.6
Total	1,750,178	100.0

The proportion these children bear to all children of the given ages is shown in the following table:

TABLE III

Children Ten to Fifteen Years Classified by Sex and Year of Age, with Percentage of Breadwinners of each Sex, for Continental United States, 1900

Age	Breadwinners		
	Total	Number	Per cent
	Both sexes		
Total	9,613,252	1,750,178	18.2
10 years	1,740,628	142,105	8.2
11 years	1,583,131	158,778	10.0
12 years	1,637,509	221,313	13.5
13 years	1,550,402	268,427	17.3
14 years	1,568,564	406,701	25.9
15 years	1,533,018	552,854	36.1
	Males		
Total	4,852,427	1,264,411	26.1
10 years	882,052	105,580	12.0
11 years	798,193	119,628	15.0
12 years	828,008	163,649	19.8
13 years	781,448	196,830	25.2
14 years	793,340	289,655	36.5
15 years	769,386	389,069	50.6
	Females		
Total	4,760,825	485,767	10.2
10 years	858,576	36,525	4.3
11 years	784,938	39,150	5.0
12 years	809,501	57,664	7.1
13 years	768,954	71,597	9.3
14 years	775,224	117,046	15.1
15 years	763,632	163,785	21.4

The opinion is so prevalent in America that child labor in agricultural pursuits is never injurious that the above table should at the outset be divided to distinguish those engaged in agriculture from those engaged in all other occupations. This is done in the following table:

TABLE IV

Breadwinners Ten to Fifteen Years of Age in Continental United States, 1900

Age	Total		In Agricultural Pursuits		In all other Occupations	
	Number	Per cent distribution	Number	Per cent distribution	Number	Per cent distribution
Total	1,750,178	100.0	1,061,971	100.0	688,207	100.0
10 years	142,105	8.1	121,422	11.4	20,683	3.0
11 years	155,778	9.1	131,807	12.4	26,971	3.9
12 years	221,313	12.6	171,643	16.2	49,670	7.2
13 years	268,427	15.3	179,393	16.9	89,034	12.9
14 years	406,701	23.2	215,678	20.3	191,023	27.8
15 years	552,854	31.6	242,028	22.8	310,826	45.2

There are no official returns of child labor in the U. S. subsequent to 1900—excepting Census Bulletins of Manufactures (1905) and reports of labor commissioners and factory inspectors in several individual states. It is to be regretted that students of this subject in America are compelled to refer, for comprehensive statistics, to

figures compiled seven years ago, the "children" reported in those returns being now from seventeen to twenty-two years of age.

Some approximate view of the present extent of child labor in the U. S. can be had, however, by a study of the increase in the number of wage-earning children in recent years. The following table compiled from the Twelfth Census (1900) by the National Child Labor Committee shows the number of children ten to fifteen years of age in the five chief groups of occupations, the increase in the twenty years, 1880 to 1900, and the present number estimated on that basis of increase:

manufacture is reported in the manufacture of paper and printing, liquors and beverages, food and kindred products, and in shipbuilding. The principal increase is shown in textiles, leather and its finished products, tobacco, and in miscellaneous industries.

When it is considered that these census figures must be gathered from available data and that the laws in many states are so defective as to defeat the true purpose of enumeration, while other states are devoid of any agency for gathering official information, the reports of the Census Department are less convincing than is desirable.

TABLE V

Some United States Census Statistics of Child Labor

	1880	1900	Increase per cent	1906 estimated
Population of continental United States	50,155,783	75,568,686	50.6	83,189,756
Total number of children 10 to 15 (inclusive) years of age	6,649,483	9,613,252	44.5	10,502 380
Number of children 10 to 15 (inclusive) years of age engaged in gainful occupations	1,118,356	1,750,178	56.5	1,939,524
Boys	825,187	1,264,411	53 2	.....
Girls	293,169	485,767	65.7	.....
Per cent which children 10 to 15 (inclusive) years of age at work constitute of all children 10 to 15 inclusive	16.8	18.2	.....	.....
Total number of children 10 to 15 (inclusive) years of age engaged in trade and transportation	38,657	122,362	216.5	147,352
Boys	35,609	100,174	181.3	.....
Girls	3,048	22,188	627.9	.....
Total number of children 10 to 15 (inclusive) years of age engaged in manufacturing and mechanical pursuits	133,007	283,869	113.4	329,127
Boys	86,171	170,653	98.0	.....
Girls	46,836	113,216	141.7	.....

	Children 10 to 13 (inclusive)	Children 14 to 15 (inclusive)

The Director of the Census, in the "Letter of Transmittal' (Jan. 25, 1907) accompanying Census Bulletin No. 69 on "Child Labor in the U. S.," says, "With the growth of population there has probably been a considerable increase since 1900 in the number of children who are working for wages, except possibly in those communities where new laws imposing greater restrictions upon the employment of young children have been enacted and are being efficiently enforced, but it is unlikely that, aside from the increase in numbers, a census taken at the present time would show conditions differing materially from those existing at the date of the twelfth census."

A series of Census Bulletins on Manufactures (1905) shows a total decrease in the number of children ten to fifteen years of age engaged in manufacturing pursuits, of nine tenths of 1 per cent in the five years 1900–5, twenty-five states and territories showing a decrease and twenty-six showing an increase. The largest percentage of decrease in the employment of children in

Real Number Probably Larger

The belief is general among those familiar with child-employing industries that the number of children employed in some states and in particular industries considerably exceeds the number reported either in the census returns or in the inspection reports of these states. This belief is based upon the known tendency of manufacturers to underestimate the number of children employed, the tendency of parents to overstate the ages of their working children, and upon the school census reports in a large number of industrial communities.

The Census Bulletins (1905) report 32,826 children employed in the manufacturing establishments of the four cotton-manufacturing states, North Carolina, South Carolina, Alabama and Georgia. These figures are based on information furnished by the manufacturers in those states. The *Blue Book* (1905), also compiled from information given by the manufacturers, shows, according to Dr. A. J. McKelway, assistant secretary of the

National Child Labor Committee, a number far in excess of the census returns. He says:

How many children, of what ages, are now employed in Southern cotton-mills, nobody knows. The manufacturing organs that are inclined to boom the industry, as to capital invested, the sum of wages paid and the number of factories and spindles and looms, are apparently trying to convince the public that this vast industry is run with an insignificant body of human workers. The census statistics just issued for 1904 are far below, in the statistics of employees, the statements made by the same manufacturers to the textile publications. And yet the percentage of children under sixteen reported by the manufacturers is enough almost to rouse a people to arms in their defense.
